Under normal conditions *cutaneous* pains are projected with accuracy to the point stimulated. Pain arising in the internal organs, on the contrary, is located very inaccurately. . . . Head especially and others have shown that the different visceral organs have, in respect to reflected pain, a more or less definite relation to certain areas of the skin. Thus we have pains arising from stimuli acting on the intestines, located in the skin of the back, loins and abdomen, in the area supplied by the ninth, tenth and eleventh dorsal spinal nerves. . . . those from the heart in the scapular region, and so on. The explanation offered for this misreference is that the pain is referred to the skin region that is supplied from the spinal segment from which the organ in question receives its sensory fibers, the misreference being due to a diffusion in the nerve centers. As Head expresses it:

"When a painful stimulus is applied to a part of low sensibility in close central connection with a part of much greater sensibility the pain produced is felt in the part of higher sensibility rather than in the part of lower sensibility to which the stimulus was actually applied. Another notable fact in this connection is the occurrence of the condition known as *allochiria*. When from any cause one or other of the cutaneous senses is depressed in a given area, stimulation in this region may give sensations which are referred to the symmetrical area on the other side of the body, or, if this also is involved, it may be referred to the area next above or below in the spinal order."

It should be of great value to bear these physiologic facts in mind when we are dealing with obscure conditions of pain.

The valuable observations of Goldthwait have established the important fact that many of the severe and chronic backaches, especially of women, are due to sacroiliac disease. He has further shown that backache often dates from the time of some operation, generally on the pelvic organs, when, owing to a failure to support the back with cushions, during the operation, a

1. Bryant, William Cullen: The Symptomatology of Prostatitis, THE JOURNAL A. M. A., March 6, 1909, III, 754.
2. Howell: Text-Book of Physiology, p. 267.

tremendous strain is thrown on the sacroiliac joints, often greatly increased by assistants on either side of the patient bearing most of their weight on the patient's thighs. The joints are left badly sprained and at times chronically inflamed. In the same way, improper methods of dress, by inducing abnormal bodily posture, with its consequent embarrassment to the viscera, doubtless is an etiologic factor of importance in many cases of obscure backache. This question of posture is of vastly more import than I am able at this time to suggest in its bearing on various pains and aches, to say nothing of its influence on the general economy of the body.

The acute fevers, appendicitis and other conditions, often accompanied or ushered in with backache, have other such definite pathognomonic symptoms that little importance attaches to this feature in such diseases.

The pain from uterine affections is most often referred to the upper sacrum—"a dragging sensation, generally referred to the brim of the pelvis posteriorly" (Kelly), being the complaint of that most common of all gynecologic ailments, retroflexion. Diseases of the ovaries, testicles and rectum, as also excessive venery and pelvic inflammations, may direct pain to the sacral region. Speaking of the pains of pelvic inflammations, Kelly makes the statement, which it seems to me good philosophy to follow generally, where pain is concerned, that:

Inflammatory pain has a definite habitat. . . . The pain of inflammation is a fixed point; it is never in one place to-day and then at some remote part of the body to-morrow, one day in the shoulder and the next in the foot or calf of the opposite leg. . . . It is a safe working hypothesis to conclude that a patient who complains of a definite pain and who from day to day and week to week is definite in her complaint as to the character and seat of the pain, has some gross lesion.

It has been my aim to deal with those pains occurring in the lower dorsal, the lumbar and sacral regions—the commonest seats of backache. And it has manifestly been impossible to dwell on more than a few of the more typical examples. Schmidt, in his discussion of lumbar pain, says:

After excluding lesions of the musculature or fascia, such as lumbago and diseases of the spine, like spondylitis, osteomalacia, etc., there is a wide range of possibilities in which nearly all the abdominal organs compete, including particularly the female generative system.

Some discredit has, I think, been attributed to Head's observations on the incidence and distribution of referred pain, by losing sight of the important fact that actual pain is not always experienced, but, "according to the intensity of the visceral stimulus, actual pain may be experienced, or there may result a state of hyperesthesia or hyperalgesia which manifests itself by an increased susceptibility to stimuli, so that contacts which would ordinarily evoke only sensations of touch now give rise to actual pain" (Schmidt). The observation that counterirritation applied over these cutaneous areas may result in relief of the pain and the underlying lesion throws a new light on the results, at times appearing to crown the arbitrary methods peculiar to osteopathy and other counterirritant curative agencies.

CONCLUSION

I believe that Pott's disease would be much more frequently and earlier diagnosed if its initial manifestations, of which pain in the form of backache is often conspicuous, were looked for and recognized.

Backache is of diagnostic value chiefly when unilateral and when guardedly controlled by some accompanying facts of diagnostic importance.

Familiarity with the work of Henry Head on the subject of pain, especially of referred pain, will often be found of the greatest help in reaching a correct and often a difficult diagnosis.

THE CLINICAL INDEX OF THE THORAX ASSOCIATED WITH PULMONARY TUBERCULOSIS *

WALTER L. NILES, M.D.

Instructor in Medicine in The Cornell University Medical College
NEW YORK

Until very recently almost all text-books on medicine and physical diagnosis have described the thorax associated with pulmonary tuberculosis as flat, and even now some of them persist in this. For example, this statement appears in a recent edition, "The paralytic or phthisical chest is abnormally small, long and flat." This is a curious survival of a medical fallacy which apparently grew up simply because in the past no one had measured any considerable number of such chests. Most of them do appear to be flat, it is true, but taking measurements on a few will show that in most cases the flattening is not real and the appearance is an illusion. This is produced by the shoulders being displaced more forward and downward than normal, which makes the anterior surface of the chest appear to be displaced posteriorly—the type commonly called "round-shouldered" or "hollow-chested." There are two factors which tend to produce the displacement of the shoulders in this manner: (a) a more nearly round chest than the normal, and (b) relaxation or deficient development of the shoulder-girdle of muscles.

It remained for Hutchinson,¹ while engaged in a developmental study of the human thorax, to measure twenty tuberculous chests which he found to be more nearly round than the average normal chest. This he reported in 1897, and subsequent investigation convinced him that the average tuberculous chest is not abnormally flat, but is, on the contrary, abnormally round.

Measurements of the diameters of the chest are made on an imaginary horizontal plane passing through the junction of the fourth costal cartilages with the sternum. Dividing the anteroposterior diameter by the transverse diameter gives the ratio (usually expressed as a percentage) which the former bears to the latter, and is called the "clinical index" of the chest. Several thousand measurements taken at the Yale gymnasium and in the German army² place the average, normal, adult clinical index at 70 per cent., or 70 as it is usually expressed. There is evidently chance for a considerable degree of error in the procedure, as it is impossible to specify definite landmarks at which the measurements should be made, because of the varying degrees of tilting of the ribs found in different individuals. On the normal skeleton such a horizontal plane intersects the spine of the seventh dorsal vertebra, but this may occur

at the sixth or the eighth in abnormal chests. At the midaxillary line the plane passes through the fifth interspace in normal chests, but it frequently intersects the fourth or sixth interspace in tuberculous chests. Errors also arise because of variability in the thickness of the integument in different individuals, and because of unequal amounts of pressure placed on the calipers in making the measurements.

Hutchinson's first series of 20 cases¹ of pulmonary tuberculosis representing all stages of the disease gave an average index of 78. He subsequently reported 350 cases collected by him from various observers which showed an average index of 79.7. Of these, 40 were of his own which averaged 79.5; 42 cases in the Brompton Hospital (England) averaged 79.6; 75 cases collected by Colbeck of London averaged 80.3; 42 of these were in the first stage and 14 were women which averaged 84.3; White of Boston had 35 cases, with an average of 77.9, of which 10 were women averaging 78.3; Evans and McHugh² of Chicago had 107 cases averaging 80.8, and Abrams of San Francisco had 35 cases averaging 78. Bessesen³ has independently reported 21 men with incipient tuberculosis who gave an average of 74.2, and 6 women, also in the incipient stage, averaging 75.2.

This report is based on a study of 1,022 measurements made on tuberculous patients in the Bellevue Hospital Dispensary and the Cornell University Medical College Dispensary. About one-half of them were made by various physicians in the Bellevue Hospital Dispensary, and the remainder by myself. As the results obtained by the others almost exactly agree with my own, the element of personal error seems to be eliminated.

This series of cases occurred in several races and many nationalities, including both sexes and all ages from 8 to 84 years, in all stages of the disease. The average clinical index of all the cases (1,022) is 75.98. In order to remove all possibility of error from including normal infantile chests, I have excluded all under 20 years of age, leaving 929 patients aged 20 years or more, which gave an average index of 76. This is somewhat lower than the averages noted by other observers, except Bessesen, whose results closely correspond with mine. The difference is, in some instances, because the measurements were taken at the level of the nipples instead of at the junction of the fourth costal cartilages with the sternum, as done by Bessesen and in this series of cases. The highest index observed was 100. The patient was a woman, aged 44, who gave a history of cough for three months and was in the incipient stage. There were no signs of emphysema, except that her anteroposterior and transverse diameters were each 22 cm.

While the average clinical index of tuberculous chests is greater than normal, not every such thorax, by any means, gives a high index: 245 (24 per cent.) of my cases were below 70. This fact greatly limits the value of such measurements in the diagnosis of pulmonary tuberculosis. Finding a high index in an individual case may increase the suspicion of tubercle infection, yet the value of the evidence is so slight that it can have very little weight. The lowest index observed was on a

man, aged 39, who was in the second stage. His transverse diameter was 27.5 cm. and his anteroposterior 15 cm., giving an index of 54.4.

A considerable number of cases show indices which are exactly, or very close to, normal. Taking, for example, variations between 68 and 72, inclusive, I find that 219 (21 per cent.) come within these limits. There were, however, only 83 cases (8 per cent.) which were below 68, while 720 (70 per cent.) were above 72.

Sex is practically no factor in modifying the indices of tuberculous chests, as 808 males averaged 75.93 and 214 females averaged 76.16.

The question whether this increased index is the result of tuberculosis naturally arises. Hutchinson and Bessesen both concluded that it was not, and my findings tend to confirm this. If it develops because of changes in the lungs it is reasonable to conclude that the more extensive the pulmonary lesion the greater the resulting change in the thorax. Separating my cases into stages of the disease gives the following result:

Stage.	No. of Cases.	Average Index.
I	231	75.82
II	637	76.04
III	154	75.97

Though the average indices of the second and third-stage cases are slightly higher than that of the first-stage cases, the difference is so slight that it may be disregarded. The increase in index, then, is not in proportion to the extent of the pulmonary lesion and is, therefore, probably present before the lesion has developed in the lungs.

Classifying the cases by decades of life results as follows:

Decade.	No. of Cases.	Average Index.
1	2	84.50
2	91	74.40
3	311	74.62
4	354	74.43
5	190	80.50
6	63	77.82
7	10	77.40
8	1	79.00

The higher indices after the fourth decade are probably accounted for by the emphysema which normally develops with advancing years.

Some of the cases showed all of the signs of emphysema and consequently gave high indices. It was impossible, however, to exclude them, as one can not clinically decide how much is hypertrophic emphysema and how much is compensatory, having developed secondary to the tuberculous process. It is also unfair to exclude all indices above a certain point as being wholly due to emphysema, as some of the highest noted were on patients giving no signs of it; yet the fact remains that if it were possible to exclude all of those cases in which hypertrophic emphysema existed the average index of the series would be considerably lessened, certainly not above 74.5, which is the average index of the cases in the second, third and fourth decades, 756 in number.

What, then, is the cause of the abnormal relations of the diameters of the chest which exist in three-fourths of the individuals who later develop pulmonary tuberculosis? Hutchinson,¹ by a study of comparative and developmental anatomy, concluded that it was due to an arrest of development, and his conclusion seems to be well founded. With only two exceptions (whales and bats), all mammals below the anthropomorpha have chests which are deeper than they are broad; for example, horses, dogs and cats. They assume the horizontal position and are quadrupedal. It is evident that the chest best suited to their necessities is one which gives a maximum of room for expansion of the lungs without

compression of the heart and great vessels, and at the same time allows free movement of the forward limbs in running. This the deep or high-indexed chest gives. When, however, the forward limbs are not used for locomotion, but for climbing, swinging, defense and other lateral movements, the deep chest restricts the freedom of such motions, and the animal is better served by one which is more nearly round.⁵ The anthropoid apes are examples of this class: they assume the semierect position and in them "the thorax is rather broad than laterally compressed."⁶ In man, as has been shown, the thorax is normally flattened anteroposteriorly. Thus we see that in general as the mammalia ascend in the scale of development their chests become more flattened. The apparent explanation for the nearly round chests of whales and bats is that, as their anterior limbs are no longer used in ground locomotion, forward and backward movements, but laterally in swimming and flying, respectively, such a chest is best suited to their needs.

An examination of the human chest from fetal to adult life is of interest in this connection. At the fourth month of fetal life the chest is considerably deeper than it is broad—the lower mammalian type. During the later months the anteroposterior diameter relatively decreases until at birth the chest is practically round⁷—the anthropomorphical type; and after birth it gradually flattens out until the normal index of 70 is reached at about the eighteenth year. The period of most rapid change is during the first six years of life; and at puberty the index is about 80. It is evident, then, that each human chest in its development has gone through the same stages with respect to its diameters as has the human type in its ancestral development.

Having in mind the above, and that the type of chest in which tubercle infection most frequently develops is the same as the normal human chest at puberty, it is a fair conclusion that the typical tuberculous chest is one which has been arrested in its development at or about puberty. Bessen⁴ believes that the lack of development is principally in the transverse diameter, the anteroposterior becoming about normal. High-indexed chests have been shown to be common among paupers and the insane,⁸ and a study of the literature and photographs leads me to believe that such chests may also be found associated with idiocy, cretinism and chondrodystrophy. High-indexed chests, then, are frequently associated with various forms of so-called degeneracy, which are really conditions of maldevelopment.

It has been suggested that the degree of abnormality in the diameters may have some influence on the prognosis of pulmonary tuberculosis, and Hutchinson⁸ states that in 31 successive cases, of 16 patients who did badly the average index was 80.2, while 15 that did well averaged 74.6. My observations regarding this have not been sufficiently extensive to warrant a conclusion, though a few cases have shown results which lead me to believe that it may be true.

If high-indexed chests predispose to pulmonary tuberculosis, it is possible to lessen this predisposition by exercises which tend to produce an increase in the trans-

verse diameter; such as climbing, swinging by the arms and movements laterally from the body. It also creates the presumption that it may not be best to prescribe for patients with pulmonary tuberculosis exercises which tend to develop deep chests.⁹

CONCLUSIONS

1. The typical tuberculous chest is more nearly round than the normal chest.
2. The increased index precedes development of tubercle infection in the lungs. It is due to an arrest of development at or about puberty and predisposes to pulmonary tuberculosis.
3. Abnormally high-indexed chests in children should be corrected by proper exercises.

CHLOROFORM—THE IDEAL HEMOSTATIC IN PULMONARY HEMORRHAGE

JOSEPH B. FISH, M.D.

Superintendent Sanatorium of the Jewish Consumptives' Relief Society

EDGEWATER, COLO.

In spite of the great advance made in medicine during the last half-century, the treatment of pulmonary hemorrhage remains practically the same as at the time of Galen, with the addition only of a number of the newer drugs which do not seem to materially improve the solution of this vexed question. The therapeutics of this frequent complication in pulmonary tuberculosis is still based entirely on clinical experience, which in the main is unsystematic and haphazard. Morphine, atropine, ergot, hydrastis, lead acetate, stypticin, adrenalin, calcium chlorid, gelatin, nitrites, magnesium sulphate, and a host of other drugs used either singly, in combination, or in rotation, are doled out to the patient with more or less disappointment until Dame Nature, in spite of the drugs and the deranged digestion resulting from their employment, comes to the sufferer's rescue and by her *vis medicatrix* brings about the formation of a blood clot at the bleeding point.

The lot of a patient afflicted with pulmonary hemorrhage is, indeed, pitiful and his aspect at once evokes compassion. Compelled to lie flat on his back without even a pillow under his head, enjoined from changing his position, or at times even his clothes, no matter how irksome or oppressive, forbidden to turn his head or utter a word, subjected to the inevitable ice-bag, which occasionally leaks and chills him to the bone, stuffed with cracked ice in lieu of food, given frequent hypodermic injections, the patient must needs look very forlorn and think of naught but his impending doom. Nor is the position of the attending physician an enviable one, harassed as he is by anxious relatives and uncertain as he must be as to the results of his treatment.

In a previous paper¹ I made cursory mention of the successful use of chloroform in the treatment of pulmonary hemorrhage. Since that time I have continued my experiments with the drug and have given up one by one almost all the above-mentioned medical agents, limiting my treatment even in very severe hemorrhages to chloroform only. I am happy to report most excellent results from the use of chloroform in nineteen

cases of pulmonary hemorrhage, two of which ordinarily would have been regarded as probably fatal.

The routine treatment has always been uncertain and empirical because of the fact that the bleeding point is not accessible and therefore can not be reached directly by hemostatics. Our aim, therefore, must be to bring about a blood clot in an indirect manner. This may be achieved in one of the following ways: (1) by reducing the force and rate of the heart beat; (2) by reducing the blood pressure; (3) by reducing the respiratory movement.

Now the effect of chloroform on the circulation is chiefly to depress the vasomotor system, causing an extraordinary fall of blood pressure. Complete vascular relaxation ensues, facilitating the passage of the blood from the arteries into the capillary network and veins. The patient is, so to speak, bled into his own vessels. There is also some cardiac enfeeblement and dilatation, which likewise contributes to the fall of blood pressure. Chloroform has also a depressing effect on the respiration, because of the lessened supply of blood to the respiratory center.

As chloroform produces coagulation of the blood *in vitro*, it is possible that in some cases its action in the body is aided by direct contact of the vapor with the bleeding point.

In chloroform, therefore, we have all the requirements for an ideal hemostatic. It lessens the heart action, reduces the blood pressure and diminishes the respiratory movement. It acts promptly and efficiently and, what is more, it leaves the digestive tract intact.

The patient being placed in a semirecumbent position, from 2 to 4 c.c. of chloroform are dropped on the usual inhaler, or wad of cotton, and held near the nostrils of the patient. The hemorrhage will cease within five or ten minutes. During the following twenty-four or forty-eight hours the patient will be bringing up blood clots. The inhalation of 15 to 20 drops every hour is continued for a few days. Ammonium chlorid with small doses of codein is given internally every four hours. The ammonium salts favor expulsion of retained secretions, whereby we hope to avoid an aspiration pneumonia and the codein will prevent excessive coughing. It is also a good plan to administer a teaspoonful of magnesium sulphate three times daily to remove excrementitious matter which, when retained in the blood, will stimulate the vasomotor center and raise the blood pressure.

In the limited number of cases in which I had the opportunity of using chloroform the results have been all that could be desired. Being fully aware of the paucity of material on which this study is based, I hope that a more extensive trial by the profession at large will bring out more fully the value of chloroform in pulmonary hemorrhage.

Antituberculous Substance in Tuberculous Glands.—Dr. A. Fontes (*Brazil med.*, 1908, xxi, No 40) offers the following conclusions derived from his studies *in vitro* of the tuberculous glands of guinea pigs: 1. There exists in the tuberculous glands of guinea pigs a substance capable of reducing the number of tubercle bacilli in a given emulsion. 2. This substance does not exist in normal glands. 3. The maximum effect of this substance is exercised after 120 hours' contact; when it has reached this it ceases. 4. The addition of a larger amount of extract of tuberculous gland extract, after the appearance of the action, does not cause a new diminution of the number of bacilli. 5. This substance is not reactivated by the addition of fresh serum from a new guinea pig. :

ISOHEMOLYSINS AND ISOAGGLUTININS OF HUMAN SERUMS, WITH SPECIAL REFERENCE TO CANCER

WILLIAM J. BUTLER, M.D.

Attending Physician Cook County Hospital

AND

W. T. MEFFORD, M.D.

CHICAGO

In 1892 Maragliano¹ directed attention to the fact that the blood serums of patients afflicted with various diseases exerted a destructive influence on the blood corpuscles of healthy individuals, and also on the corpuscles of pathologic cases and set free hematin. He expressed the opinion that the reduction in sodium chlorid in the blood in different conditions of disease was a factor in the solution of red cells. This appears to be the first observation on isohemolysins of human serums.

Ehrlich and Morgenroth² demonstrated that the blood serums of goats that had been immunized by homologous blood corpuscles contained isohemolysins, the serums of the immunized goats being hemolytic for the corpuscles of other goats.

Von Dungen,³ on the other hand, found that the serums of guinea-pigs that had been immunized with the tracheal epithelia of cattle was not only destructive to the tracheal epithelia of the latter, but also exhibited an hemolytic influence on the blood corpuscles of cattle.

Landsteiner,⁴ in 1890, showed that human serums often agglutinated human corpuscles. He found this phenomenon of agglutination especially marked in the blood of diseased individuals.

The first extensive clinical application of the phenomena observed by Maragliano and Landsteiner was made by Ascoli,⁵ who examined seventeen normal persons and ninety-seven patients for isohemolysins and isoagglutinins. He employed in his technic a mixture of equal parts of serum and of blood corpuscle suspension. He used a 2½ per cent. suspension of blood corpuscles for the hemolytic reaction and one-half of this for the agglutination reaction, the serums for the latter being employed in different dilutions. His controls consisted of suspensions of the blood corpuscles in salt solution.

He found the agglutinating power of the serums of healthy individuals hardly observed in a higher than a 1 to 20 dilution of their serums, while in pathologic conditions it was often found in much higher dilution. In the examination of normal bloods, hemolysis was in most cases *nil*. In a very few he had observed a trace of solution and in rare cases a slight solution of red cells had occurred, as indicated by the rose color of the fluid after sinking of the cells.

In the examination of the serums of pathologic cases with relation to hemolysins, he found negative results with 5 cases of chlorosis, 2 of infection with *Anchylostoma duodenale*, 1 of abscess, 3 of acute rheumatism, 3 of exudative pleurisy, several of bronchitis, several of acute and chronic gastritis, 2 of lead-poisoning, 1 of acute and 2 of chronic nephritis.

On the other hand, he found strong isoagglutinating and isohemolytic properties in the serums of two patients with carcinoma of the stomach, a probable Adli-

⁵ Ascoli: *München med. Wchnschr.*, 1901, xviii, 1239.

son's disease, and a multiple pneumococcus infection. He examined chiefly cases of pneumonia, typhoid and tuberculosis.

In tuberculosis he had observed the serums able to dissolve erythrocytes and also to agglutinate them in a greater dilution than did normal serums. He also noticed marked isolytic properties of the blood serums of pneumonia patients. He states that isoagglutinins and isolysins are not to be found constant in the diseases mentioned, and that it was advisable to allow serum to act on the blood corpuscle suspension of different individuals as the isolysins are not active against the erythrocytes of every one.

From the experiments of Bordet, Ehrlich and Morgenroth, von Dungern, Ascoli, etc., it was evident that inoculation with the cells of an homologous or heterologous species, or, as might be expected with a tumor growth, would give rise to the formation of isolysins in the immunized individual or animal.

Weil⁶ observed this peculiarity of the serum of tumor dogs for erythrocytosis of normal dogs. He examined a number of patients suffering from cancer, etc., and observed the same phenomenon.

Crile,⁷ Blumgarten⁸ and Whittemore⁹ have also reported on this peculiar property of the serums of patients suffering from cancer, tuberculosis, etc., the technic employed by them being practically the same as that recommended by Landsteiner, Ascoli, etc. Blumgarten, as had been recommended by Landsteiner, used the washed corpuscles, without salt solution, as Maragliano had stated in his communication that among other factors the decrease of sodium chlorid in the serum of diseased patients had something to do with their dissolving red blood corpuscles.

In order to determine whether or not the hemolytic reaction had any specific value in the diagnosis of disease, we examined the bloods of a number of individuals. Some of these were healthy adults, others were suffering from cancer, typhoid, pneumonia, gastric ulcer, etc.

We found on completion of our work that our observations coincided in many points with those of Ascoli. We had not made any effort to estimate quantitatively the agglutinin content of serums: we did, however, observe a definite relation to exist between isolysins and isoagglutinins to which Landsteiner¹⁰ had referred conjecturally in his first communication on isoagglutinins.

Among the seventy cases examined, we tried nine normal persons against each other for isoagglutinins and isohemolysins.

Landsteiner¹¹ divides individuals into three main groups by means of isoagglutination, namely: (1) those whose corpuscles are not agglutinated by the serums of Groups 2 and 3, but whose serums agglutinate the corpuscles of these groups; (2) those whose corpuscles are agglutinated by the serums of Group 3 and whose serums agglutinate the corpuscles of Group 3; (3) those whose corpuscles are agglutinated by the serums of Group 3 and whose serums agglutinate the corpuscles of Group 2.

According to this classification for agglutination, 4 of the normal persons belonged to Group 1, 4 to Group 2, and 1 to Group 3. In 4 the supernatant fluid showed a faint pinkish tinge, one tube showing a considerable trace of solution. In these tubes agglutination of corpuscles had occurred. We did not notice isoagglutination of the strictly homologous corpuscles. In none of the tubes in which isoagglutination had not occurred was any trace of hemolysis present.

Among the pathologic cases examined by us were 22 of cancer, mostly of the stomach, uterus and breast. In 13 of these, or 59 per cent., we found isohemolytic serums, some hemolyzing the corpuscles of cancer patients. Of 8 cases of tuberculosis, 3 showed the hemolytic reaction, 1 hemolyzing the corpuscles of another tuberculous patient. We did not observe the reverse hemolysis in tuberculosis referred to by Crile.

Of 5 typhoid patients, 2 gave a strong hemolytic reaction, 1 of these hemolyzing the corpuscles of another typhoid patient as well as of a normal person.

Of 5 pneumonia patients, of whom 1 was convalescent, the serums of 2 showed a strong isolytic action. Ascoli found in 1 case of pneumonia a decrease in the hemolytic action of the serum from week to week until it disappeared.

In 2 cases of gastric ulcer, 1 of convalescent malaria, 1 of pernicious anemia, 1 of postdiphtheritic paralysis, 1 of salpingitis and 1 of pregnancy, the serums were found to be isohemolytic.

Two cases of pleurisy with effusion gave a negative result.

The degree of isolysis observed in the Maragliano reaction in diseased conditions is quite variable, some red cells showing apparently a greater degree of resistance than others, and some a complete resistance to the action of isolysins. According to Landsteiner, Ascoli, Hektoen,¹¹ etc., the isoagglutinins are considerably increased in some diseased conditions over that found in normal individuals.

Landsteiner, who first thought a relation existed between isoagglutination and isohemolysis, stated in a subsequent communication that an essential difference existed between the phenomena of isoagglutination and of isohemolysis, in that in the Maragliano reaction the serum acts on the corpuscles of the same individual.

In the pathologic serums examined by us we observed the hemolytic action of the serum on the corpuscles of the same individual in two cases of cancer and one of convalescent malaria.

On the other hand, we observed a close relation to exist between isohemolysis and isoagglutination in the examination of bloods of pathologic cases. This association was so frequently observed that we could apprehend with considerable certainty before examining the corpuscles that they had been agglutinated from the pinkish color of the supernatant fluid.

While this observation is not constant, it is sufficiently frequent to influence greatly the results obtained with the hemolytic reaction.

It would appear from our observations that the frequency of what is commonly termed a positive isohemolytic reaction will depend usually on two factors: (1) to what group with regard to isoagglutinins the suspected blood belongs, and (2) whether there are bloods among those against which it is tested whose corpuscles will be agglutinated by the serum of the suspected blood, and it is immaterial apparently whether the cor-

puscles are from another case of cancer, tuberculosis, etc., or a normal. We find confirmation of this latter observation in our work in the original statement of Maragliano, that the serums of pathologic cases are hemolytic for the corpuscles of diseased individuals as well as for the corpuscles of normals.

In regard to the nature of the isolytic substance, Ascoli was able to show that its activity was destroyed by heat, but that it could be reactivated by the addition of a fresh serum. This would seem to indicate that it was an amboceptor that depended on the presence of complement for exerting its hemolytic influence on blood corpuscles, and that it was not due to the action of any toxin produced by an infectious agent.

On the other hand, holding in mind the experiments of von Dungern, Ehrlich and Morgenroth, Ascoli, etc., it would seem that this hemolytic property of pathologic serums was associated in some way with cell destruction, and that, as Ascoli suggests, a reaction of the organism against the absorbed products of cell destruction results in the formation of antibodies which are hemolytic.

We examined, several weeks ago, among others, a student's blood which was taken as normal. At that time his serum, which agglutinated the corpuscles of Groups 2 and 3, did not show any hemolytic action on human corpuscles. We examined his blood a few days ago and found that his serum hemolyzed corpuscles which it agglutinated to about the same extent as had a cancer serum in the same series of examinations. On inquiring into the history of the student during the interim of examinations, we found that he had lost about seventeen pounds in weight. He denied any infection and said that he felt well, but tired. He attributed his loss of weight to increase of work and loss of sleep in preparing for state examinations.

The circumstances in this instance, in which a normal-acting serum was converted into a pathologic-acting serum, would seem to support the theory that the isohemolytic property of serum is dependent on absorption products or antibodies of absorption products of abnormal cell degeneration.

In reviewing the literature of this subject and in analyzing our own work, which we find to conform to the earliest observations on this subject, we can see no reason for bringing this isohemolytic action of serum into specific relation with any one disease or condition. On the other hand, we can confirm Maragliano's original observation, that the serums of many pathologic cases may exert an hemolytic influence on the blood corpuscles of normal and diseased individuals.

Lessons from the Russian Cholera Epidemic.—The Russian medical societies are now reporting the experiences of members during the recent cholera epidemics at various points. The importance of bacilli carriers in the dissemination of the disease is generally emphasized—this being evidently responsible for the spread of the epidemic at Dorpat and possibly explaining also the flaring up of the disease after it has been apparently extinguished by the winter's cold—the germs being kept alive by repeated contact infection. In the preceding epidemic a number of cases broke out simultaneously, all traced to contamination of the water, but in the present epidemic the cases occurred at long intervals and in widely separated parts of the city, probably the result of contact infection, possibly by intermediation of sound bacilli carriers. All agree that personal hygiene is the most effectual means of prophylaxis against cholera so that in highly civilized communities there is comparatively little danger from the disease.

EPILEPSIA PARTIALIS CONTINUA OCCURRING IN CEREBRAL SYPHILIS

REPORT OF A CASE, WITH OPERATION *

WILLIAM G. SPILLER, M.D.

Professor of Neuropathology and Associate Professor of Neurology
in the University of Pennsylvania

WITH THE COLLABORATION OF

EDWARD MARTIN, M.D.

Professor of Clinical Surgery in the University of Pennsylvania
PHILADELPHIA

It seems almost incredible that any form of epilepsy should exist and yet not be well recognized. The literature of this disease is very extensive, and much of it contains little that is new. There is a type of epilepsy, however, which does not appear in the text-books, and even in the most recent writings receives scant recognition. Thus, Oppenheim¹ mentions it in a few lines by stating that cases occur in which during the interparoxysmal period muscular twitchings of short duration and without loss of consciousness are observed in one or another portion of the body. It has been described, especially by Russian writers, as "epilepsia continua" (Koshewnikow, Muratoff, Bechterew); Bruns also mentions it.

The cases differ from those of myoclonic epilepsy; the twitchings are limited to a small portion of the body, and are more intense than in myoclonia.

The name, "epilepsia partialis continua," seems to have been first employed by Koshewnikow,² who reported four cases in 1894. Characteristic epileptic attacks occurred in all four cases; sometimes they were abortive, sometimes they were with loss of consciousness. No period of cessation occurred between these attacks, as in certain portions of the body clonic movements persisted with variation in intensity, and when these movements became very severe they passed into an ordinary epileptic convulsion. The patients were unable to work, as they held the twitching limbs with those not implicated by the movements. In two of the cases the disorder began with local spasm, which passed into the ordinary epileptic convulsion; in the other two the persistent clonic movement followed the ordinary epileptic attack. No information as regards pathology was obtained either by operation or necropsy. This form of epilepsy has, since the report of these cases, been called, by some writers, Koshewnikow's epilepsy.

Orlowski³ reported a case of this type in which general epileptic attacks occurred after an infectious disease, and later the patient had attacks every ten or fifteen minutes without loss of consciousness. Twitching of fibrillary or tie-like character was seen in the right side of the face, implicating also the tongue and larynx and continuing during sleep. The right limbs were weak. The case was thought by some of those who heard the report to be functional and not organic. No pathologic cause was determined.

Choroschko has written a monograph on this form of epilepsy, but, as it is in the Russian language, I have been obliged to depend on abstracts.⁴ In the *Jahresbericht für Neurologie und Psychiatrie*, 1907, it is stated that Choroschko reports three cases of his own and refers to eleven in the Russian literature. Outside of

4. Choroschko: *Neurol. Centralbl.*, 1908, p. 279; *Jahresb. f. Neurol. u. Psychiat.*, 1907, p. 772.

Russia, Bruns alone has observed this rare type. Choroschko differs from Koshewnikow in that he believes the lesion is subcortical and suggests the name "polycelonia epileptoides continua." The twitchings are clonic and extend gradually from a limited area, and usually synergetic muscles are affected, especially on the right side. There seem to have been no lesions found either by operation or necropsy, so far as one may judge from the abstracts.

It may not be amiss, therefore, to report a typical case of this partial constant epilepsy, especially as it is one in which operation was performed. It shows that the lesion may be cortical.

History.—The patient, a colored man, aged 22, was admitted to my service at the Philadelphia General Hospital, Feb. 19, 1908. He gave a clear history of syphilitic infection. In July, 1908, he had his first convulsion. The fingers of the right hand twitched at first slightly but later more severely, and the convulsion confined to these members lasted about twenty minutes and left a paralysis of the hand persisting about fifteen minutes. He had another convulsive attack confined to the right hand in about three weeks. The whole right upper limb became implicated in the third attack, and this attack was followed by unconsciousness. There seems to have been involvement of the face and right lower limb also in the fourth attack. After these repeated attacks persistent weakness of the right upper limb ensued.

Examination.—The weakness of the right side of the face increased greatly after the man entered the hospital, and the palsy was of the cerebral type, i. e., slight in the upper part of the face and almost complete in the lower part. The weakness of the right upper limb also increased considerably, and the right biceps and triceps reflexes were much exaggerated, whereas the corresponding reflexes on the left side were normal. Stereognostic perception and sense of position were lost in the right hand. Tactile sensation also seemed to be diminished in this part, but was normal in the face. The motor power was about normal in the lower limbs, and the patellar reflex was only a little prompter on the right side. Babinski's sign was not distinct on either side. The ocular examination revealed little that was abnormal.

The case was clearly one of syphilis of the brain with convulsions of the Jacksonian type, only the right side of the body being involved, and the persistent paralysis being confined to the right side of the face and the right upper limb. Other attacks which the patient had made the case an unusual one and worthy of careful study.

Independently of the typical attacks he had twitching confined to the right side of the face lasting an indefinite period, an hour or more at a time and occurring very frequently. There were periods in which he had none of these spasmodic movements, but the movements were almost constantly present, and resembled a tic movement or fibrillary twitching. They were not excessive in their intensity, and implicated the muscles about the right side of the mouth, about the right eye, the right cheek, the right ear, and the right side of the neck. After persisting for some weeks in the face they ceased in this part, and were observed in the right upper limb. The whole right upper limb was displaced in these clonic movements, but the displacement was not excessive, and the spasm consisted of slight twitchings lasting indefinitely as did the previous twitchings of the right side of the face. There was no impairment of consciousness. The peculiarity was the almost constant duration of fibrillary or twitching movements in the face at first and later in the right upper limb, movements that were very unlike the severe spasmodic contractions usually seen in an epileptic attack, both in intensity and duration.

It is a question whether operation is advisable in cerebral syphilis. Two cases with operation have been observed by me in addition to the one described in this paper; in one the removal of a gumma of the dura was followed by much improvement during a period of seven or eight years, but the patient eventually died of his syphilis. In another case excision of a gumma of the brain was performed, but the result was far

from satisfactory, and in the case reported in this paper operation accomplished little. However, as there seemed to be a chance for the patient from operation, I referred him to Dr. Edward Martin, whose report is here given:

Because of the failure of mercury and iodid treatment, the steady progression of symptoms, the possibility of their leading to a fatal termination, operation was deemed advisable in this case. The Rolandic area was exposed by a periosteal flap which was raised by means of a Crile cutting tool driven by an electric engine. The dura was raised without difficulty, exhibiting only slight adhesion to gummata placed in the arm and face centers. A portion of this tissue was excised by circular excision, the obvious vessels leading to it being first encircled by fine gut carried by means of a fine pointed curved needle. The operation was attended by trifling shock.

MEDICAL PSYCHOLOGY

EDMUND J. A. ROGERS, A.M., M.D.

DENVER

I make the following extract from an editorial in the *London Lancet*,¹ in 1885, based on an elaborate report by Buchanan, professor of surgery at Glasgow University, of the results that he saw during a visit to Lourdes:

There can be no question that faith-healing is a fact. The brain is not simply the organ of the mind; it is also the chief center or series of centers of the nervous system, by which the whole body is energized and its component parts, with their several functions, are governed and regulated.

There is no miracle in healing by faith, whereas it would be a miracle if the organism, being constituted as it is, and the laws of life such as they are, faith-healing did not under favorable conditions occur. . . .

Pathologists will limit the area of the process to the province of functional diseases, but we are not sure that we are justified by scientific facts in making this limitation. . . . It is a fact in pathology that if the functions of an organ be maintained or restored, much of the destructive metamorphoses . . . may be arrested and to some extent repaired. . . .

The "vis medicatrix Naturæ" is a very potent factor in the amelioration of disease, if only it be allowed fair play.

This extract is from an editorial written in 1885 in one of the most reliable and conservative of medical journals published in the English language; and now, in 1908, we still find ourselves shutting our eyes to this all-important department in the healing art, and relegating its practice to ignorant charlatans, enthusiastic religionists and fanatics and mystics of endless variety.

Is not the mind as essential to the well-being of the patient as is the body? And by what law of Nature is the treatment of disease by scientific means limited to mechanical and chemical agents?

If the mental activity of the patient has been an active agent in the production of disease—and no one disputes that this is in every case an important factor—how can it be unscientific or unprofessional, or undignified, to use this same mental activity of the patient to assist in the relief of his suffering?

The answer that many would make to this question is that mental activity is such an intangible, imponderable and un-understood force that we must ignore it, and thus leave its management to those sufficiently ignorant and unscientific to undertake its direction. Could a greater confession of incompetence to care for and direct those needing our aid be admitted than this?

If the mind is an important element in the protection

from and the relief of disease, is it not as much our duty to study the mind and its functions as it is to study the body and its construction and functions? Or, briefly, is not psychology as essential a study for the physician as anatomy and physiology?

Have we not neglected an important part of our duty, and are we not, even if more scientific, quite as narrow and one-sided in our treatment of disease as those who attempt through the study and direction of the mind alone to restore the body to health?

Had we not been blinded by our narrow prejudices, the editorial just quoted and similar articles and discussions so long ago would have aroused our interest and led to our investigation, and we would have realized that we were neglecting an important element in the care of the sick and the prevention of disease.

The laity naturally look to us for direction in these matters, but in this we have failed them, and they are, in consequence, drifting away from us, and we are rapidly losing the position in their confidence which we should occupy. But, fortunately, while psychologic development has been progressing, conservative scientific men have been studying its meaning and its processes, and a great amount of knowledge has been accumulated, so that what was dark, uncertain and mysterious twenty-five years ago can now be scientifically discussed.

In order to recover the lost ground, we must assume the office of the investigator and analyzer of every element that enters into the cause, course and termination of disease. We must learn the sources and action of every force that plays a part in the preservation of health.

Do not imagine that I would by one jot or tittle detract from the importance of the work that our men have been doing in other departments. The advance of learning in anatomy and physiology in health and disease is marked, and, above all, the growth of the knowledge of the causation and prevention of disease has in the last few years been phenomenal. Nor would I in any way reflect on the ordinary medical and surgical treatment of disease. This is all good, but more is required of us. We must not only know the machine and its disorders, but we must also understand, as far as possible, the power and energy that propels the machine, and to do this we must go thoroughly into physiologic psychology and psychologic physiology, as well as into pure psychology, which last I believe to be a true science.

So much for the importance of our subject.

Science and discovery have worked revolutions in knowledge during the past fifty years, and we must not fear again to venture on new ground in our investigations.

No one of the many theories devised to explain the action of the mind in controlling bodily conditions has received general acceptance. In taking a working hypothesis, we do so, therefore, fully realizing that it is subject to amendment, as knowledge increases.

The radical change that is taking place in scientific thought was well illustrated at the meeting of the British Society at Dublin during the past summer. Dr. J. S. Haldane of Oxford University, president of the section on physiology, read a paper on "The Relation of Physiology to Physics and Chemistry."² In it he states his opinion that the mechanical theory of life has not only failed, but retarded the progress of science, and

that the study of the phenomena of life belongs to the department of biology and philosophy. Francis Darwin (son of Charles Darwin), in the Presidential Address,³ goes deeply into the discussion of the habits, memory and other qualities in plants, which we ordinarily classify as characteristic of intelligence. When vegetable cells manifest these qualities and powers, it is not difficult for us to surmise that the individual cells in our own make-up possess, to a certain extent, at least, the same characteristics: each cell exercising its particular function and duty with a degree of independence within its sphere of action, but still in all that it does, being under the direction and control of cells higher up in the functional scale. Thus, step by step, we go upward, until an ultimate central and always active control is reached.

Is it not logical to suppose that as our bodies develop from the original parent cell, each of the offspring of this cell inherits some of its individuality, and that as differentiation takes place this individuality is not lost, though function and structure be modified that each may fill its special place in the great community of cells which go to make up the whole? But, in order to bring about the necessary cooperation and coordination, the closest communication must be, from the first, preserved between the individuals, so each must be kept under the direct controlling influence of a higher delegated direction.

And so the body develops in all its parts—we must not stop here for details, but we may imagine the intelligent action displayed by each cell, the wonderful cooperation and coordination. There must be zone beyond zone of directing intelligence, each in its sphere guiding all below it, until, step by step, the whole is brought into perfect unison. There must be a controlling relationship between every separate cell in every distinct area of the whole body as development is corresponding elsewhere. To take a simple illustration, we find the cells of the toe-nail systematically arranging themselves; they must have a local directing intelligence. Again a higher intelligence directs the symmetry of the two corresponding nails, and probably a higher intelligence still compels the relative proportion of the toe-nail to, let us say, the eyelid; for we do not have a giant's eyelid and a pigmy's toe-nail in the same community.

These superimposed centers are developed, not to give power and function to the original cells, but to enable those cells to perform their duties adequately, with necessary system and cooperation. In other words, the function and power of the higher centers is delegated to them from what we may term the primary cells.

Have we not here a suggestion of Fechner's theory of the universe being but a succession of enveloping spheres of intelligence?

Or can we criticize that great apostle of pure materialism, Haeckel, for introducing and using the term "cell soul," with all that that term conveys?

Can one consider these things and doubt that an intelligent directed energy is in constant action in every cell in the whole body? I wish we had another term than "intelligence" to describe this energizing function. Intelligence is so apt to be confused with consciousness, on the one hand, and with instinct, on the other. Consciousness seems to be an entirely distinct quality or function of the mind while instinct is a term applied to

2. Brit. Med. Jour., Sept. 12, 1908, p. 693.

3. Brit. Med. Jour., Sept. 12, 1908, p. 751.

qualities which mark the lower phenomena of intelligence, but which, as I understand them, so gradually merge into definite intelligence that no line of demarcation exists, and so I use the word "intelligence" for all those qualities which show perception, discrimination and determination.⁴

And so we go up from one directing and energizing zone to another, until we reach the higher centers in the brain, but so gradual is the advance that we do not lose the sense of individual power and intelligence in the cell from which we started.

And if this individuality is a necessary element in the growth and development of the body, it is just as much so for the maintenance of the body through its whole existence. We must then realize that, while every cell in the body is to a degree an individual, still every cell is under the controlling influence, step by step, of higher cells, until the highest physiologic centers of the brain are reached, and that here a constant controlling energy is exercised which reaches to every individual cell.

We are all too familiar with physiology to necessitate my giving illustrations of these phenomena. The example of intelligent directed action in ordinary adult life that comes at once to one's mind is, of course, the action of the white blood corpuscles in inflammation. Here we have action so elaborate and so complex that it seems to approach a high order of intelligence.

We are apt to confuse our minds by falling back on the term "reflex." Reflex acts are in all cases manifestations of a degree of intelligence. The efferent impulse is entirely different in its nature, force and function from the afferent impulse, and these qualities of the efferent impulse are modified in each case by many conditions of environment.

And now having reached the high controlling centers which are in constant action, we are very close to consciousness.

One of the first facts we have to learn in psychology is that mind, consciousness, and intelligence are not synonymous terms. Our mind is in constant action; part of it, at least, is manifested in the constant intelligent energy of control of which I have just spoken. In this way the mind reaches every cell of the whole body and directly dominates it.

The organs of sense are the means by which impressions from without reach the higher controlling centers, and under the influences of these impressions we can see the controlling intelligent influence of the mind on our cells in a thousand ways. This is sometimes accompanied by consciousness, but this is not the rule.

I must not stop to give illustrations, for they are familiar to every student in physiology and medicine.

The ordinary reflexes, so-called, do not depend on consciousness. Acts which we can control by our consciousness we call volitional, but most acts that can be consciously controlled may also be performed without consciousness. Acts that the mind habitually performs, outside the influence of consciousness, we term involuntary.

Thus the control of nearly all the cells of the body by the higher centers is being constantly exercised, but

this exercise is habitually involuntary. Hence, nearly all physiologic functions, such as the affairs of circulation, nutrition, secretion, excretion, digestion, etc., etc., are classed as involuntary acts.

And now we come to the all-important question, Can acts, habitually involuntary, in any way be controlled through the conscious mind? In other words, can these physiologic offices of the body be in any way influenced by conscious volition, that is, by the will?

This question may simply involve habit—we may from disuse have forgotten how to use this power—or it may be evolutionary. Is a new power approaching in the developing consciousness of higher intelligence?

As the disturbance of physiologic function is the important element in the causation of disease, and the restoration of function may often restore health; indeed, as resistance to infection, immunity, etc., are produced by the functional secretions of certain cells, we realize at once the importance of this question of the control of cell functions by the will. Indeed, on this question "hang all the law and the prophets" of psychologic medicine.

And now we will turn and approach this question from another standpoint.

From Professor William James, of all thinkers and writers on these subjects, I myself have derived the most guidance. He stands to me as an intellectual giant, above prejudice and preconceived notion, weighing each new fact as it presents, and giving it its proper significance in the storehouse of our little knowledge. He is, as I suppose you all know, a graduate in medicine from Harvard, and so we can claim him as of ourselves, but his great knowledge of philosophy and psychology have given him a higher and broader point of view than most of us can obtain, and he can easily see over the stumbling-blocks that seemed insurmountable to me. To me it is now incomprehensible to conceive why I was ever allowed to practice medicine without some knowledge of philosophy, as well as psychology. I supposed them a mystifying labyrinth of confusing and unprovable theories, while if philosophy is anything it is the science of the conformation of knowledge, and places each science in its proper place in relation to each other specialty. It is the balance-wheel of acquired knowledge, the educator of scientific judgment.

But to return to Professor James: In his presidential address⁵ to the American Philosophical Association at Columbia College, Dec. 28, 1906, on the "Energies of Men," he comes nearer giving a direct affirmative answer to our question than I find in any short article that has come under my notice.

In this article he calls attention to the fact that in every one there are latent powers which, when aroused under extraordinary stimuli, enable one to do and to suffer what would have been thought beyond all possibility.

After many illustrations in the ordinary affairs of life, he comes to our important question. He says:

There seems no doubt that we are each and all of us to some extent victims of habit-neurosis. We have to admit the wider potential range and the habitually narrow actual use. We live subject to inhibition by degrees of fatigue which we have come only by habit to obey. Most of us may learn to push the barrier further off and to live in perfect comfort on much higher levels of power.

4. Since this was written, Alfred Russell Wallace has published in the *Fortnightly Review*, March, 1909, page 434, this statement: "Now even the extreme monists, such as Haeckel, are driven to the supposition that every ultimate cell is a conscious, intelligent individual that knows where to go and goes there." See also the (New York) *Independent*, March 4, 1909, page 457, and the *American Review of Reviews*, April, 1909, page 485.

5. *Phil. Rev.*, January, 1907, xvi, 1.

And again:

The normal opener of deeper and deeper levels of energy is the will. The difficulty is to use it, to make the effort which the word "volition" implies.

He then discusses the various processes by which the will may be developed in this power of control, and especially by methodical ascetic discipline, such as that of the Hindu Hatha Yogi system. And here he takes a case which is so pertinent to our question that I shall take the liberty of using it for our instruction:

A European friend of his, a man of the highest literary and scientific attainments, is greatly hampered in his work by a disordered nervous system manifesting itself in recurring attacks of great prostration. After exhausting the resources of ordinary medicine, he entered on the discipline of Hatha Yogi.

After persistent application, in spite of relapse, success came, and he found his mind and his body would obey his will, "like a wild horse tamed." A short four months of this training brought this man to an entirely new realization of life and its powers. Fourteen months after the beginning of the course, Dr. James says of him (p. 14):

There is in fact no doubt that profound modification has occurred in the running of his mental machinery. The gearing has changed and his will is available, otherwiser than it was, available without any new ideas, beliefs or emotions so far as I can make out, having been implanted in him. He is simply more balanced where he was more unbalanced.

This condition continued, and in answer to Dr. James' question as to where the virtue lay in these exercises, he wrote:

The Yogi exercises are nothing else than a methodical way of increasing our will.

I am sure that everybody who is able to concentrate thought and will and to eliminate superfluous emotion, sooner or later becomes a master of his body and can eliminate every kind of illness—this is the truth at the bottom of all mind cures—our thoughts have a plastic power over our body.

Now, this case is not unique, or even uncommon in its results; indeed, it is limited in its application, for in it we have no direct illustration of the modification of organic tissue. But I use it because here we have a highly developed mind capable of analyzing and explaining the steps by which these results are brought about.

We see the same results produced by an endless variety of agents. He who is awake and unprejudiced can see them about him all the time. Thus, we see instances, under the practice of the many scientific and unscientific, religious and emotional cults, under the many extraordinary 'pathies, and all sorts of philosophical and nonsensical theories. The results vary in different cases; sometimes this power of concentration and self-control is developed only after long systematic training; sometimes, to the receptive, it comes so suddenly that it seems to the uninitiated almost miraculous in its results.

If we study these results in conjunction with the cause apparently producing them, we soon find that the objective idea received and acted on by the subject is of secondary importance. The key to it all is the subjective condition of the mind acted on; or, expressed simply, it depends on the will of the subject.

Admit for a moment the hypothesis that the mind has the power of exercising direct volitional control over the physiologic activities of the body, and it is all simple.

All so-called "faith-healing" comes, then, to be simply a volitional act, and we soon come to see that faith is the sure expectant knowledge that conditions we look for will come about.

I doubt if any one who is capable of analyzing these cases will dispute that they are actual experiences and so must admit that the physiologic activities are, under certain conditions, frequently controlled by the will of the subject.

And now what are these conditions that enable one to be receptive of the idea of the power of the will? for if I understand the will aright the realization of its power will certainly bring about this control.

No two bodies are the same in energy and habit of action, and our mental attitude and habits vary in infinitely greater degree.

It is doubtful if any idea can find a foothold in an unwilling mind, and if this be so "the will to believe" is the first essential condition.

In the majority of minds, uncertainty and a lack of self-reliance are so constant a habit that in order to receive a new idea they must have a tangible material fact to which to attach the idea. Hence many will exercise their power quickly if they have the idea that a certain definite material or certain particular act will produce a certain definite result. Here we see, as instances, the result of acts of faith, of acts of discipline, the results obtained by many medical treatments, and by mechanical and chemical appliances.

A concentration of attention on an idea helps the will to act on it, and if we can develop that degree of concentration which enables us to shut off all other ideas, especially those conflicting with it, and to render the attention practically passive, we are approaching ideal conditions.

No man stands alone. We are constantly imparting knowledge to each other. We look to all about us for ideas and enlightenment, and if we are willing to give dissociated, passive attention to a communicated idea from one we trust, the reception and adoption of that idea is very simple and direct; indeed, we often find that our will has put the idea into action through the deeper zones of intelligence before our consciousness even realizes its import.

No idea contrary to the will of the subject will find acceptance. The will has its individual characteristics, can be cultivated, and often, in time, changed, but still it is the will and the will of the subject is, I believe, the sole agent of action.

When ideas are thus implanted on an expectant and receptive mind, we speak of it as direct suggestion. I use the term "indirect suggestion" of those cases in which the attention is placed on some objective idea or agent in order to arouse the will to action. Often by fixing the attention on an idea without objective aid, we can bring the will to exercise direct personal control to a phenomenal degree. This, of course, is called self-suggestion, or autosuggestion.

As the attention becomes dissociated and passive, the mind of the subject becomes more and more susceptible to suggestion, and we often find a degree of power and self-control developed that seems in the ordinary commerce of life incomprehensible.

Deeper and deeper states of dissociation can be discovered and exploited, but these are seldom developed in medical psychology, and we need not here even discuss them.

It thus seems that the will may be excited to this controlling activity by many different processes. As minds differ, so results may be produced by different methods. What succeeds with one may entirely fail with another, and the reverse.

While I am inclined to believe that there is no mind that can not be aroused by some process, there is a wonderful difference in the facility by which this may be done. Investigators have not yet been able to give a basis of classification or any guide by which susceptibility may be determined, except by individual experience. Everything being equal, however, the higher in the scale of intelligence the more easily can concentration and the action of the will be aroused. On the other hand, the opposing action is the will itself, especially in the egotist who knows it all, and knows that he knows it.

We are all constantly using suggestion in some form in every phase of every-day life. Indirect suggestion is the common rule, but when we understand what we are doing, and desire to use suggestion, it seems to me that it is in every way much more satisfactory to use the direct method. The power of self-control can, by direct suggestion, be developed and the mind built up to a condition of strength, power and self-reliance that is impossible by any other means.

To quote again from the same article of Professor James:

Suggestion, especially under hypnosis, is now universally recognized as a means, especially successful in certain persons, of concentrating consciousness, and in others of influencing their body states. It throws into gear energies of imagination, of will, and of mental influence over physiological processes that usually lie dormant. . . . It is, in short, dynamogenic.

That is, I take it, that one is capable under certain conditions of controlling, through some zone of intelligence, the activity of the primary tissue cells.

Clinical Notes

DEATH FROM HEMORRHAGE INTO THE SUPRARENAL BODIES IN A BOY OF EIGHTEEN*

LUDVIG HEKTOEN, M.D.
CHICAGO

The interesting and instructive case of hemorrhage into the suprarenals here reported occurred under the care of Dr. Byron Meacher, Portage, Wisconsin, to whom I am indebted for the specimen shown; namely, the right suprarenal body and the right kidney.

History.—Dr. Meacher's history of the case follows: The patient, a boy, aged 18, came to the hospital Jan. 26, 1909, for operation for a left inguinal hernia. The examination before the operation indicated that the patient was in perfect general health. The urine was normal; there was no history of any previous illness of any importance whatsoever except that four years ago he suffered from an infection of the left leg, recovery from which was complete. No record of tuberculosis could be obtained. Operation, January 27, under ether anesthesia, was uneventful. On the first day after the operation the pulse ranged from 100 to 140; it was normal on the second day, but from the third day, January 30, until February 10 it ranged from 100 to 140; after February 10 it was normal in rate but irregular until death, February 15. The pulse was feeble all this time. The temperature was normal until the third day after the operation, when it gradually rose to 102 F., where it remained for two days, gradually going down to normal during the next five days. The day before

death the temperature was subnormal. The urine at no time showed anything abnormal. Immediately after the operation the patient complained of pain a little to the left of the median line under the costal margin and later of the same kind of a pain under the right costal margin. This pain persisted with some tenderness until death. On the fifth day the liver reached three fingers below the costal margin and was then quite tender, but on the ninth day it seemed to have returned to its normal size, the tenderness, however, persisted. Some food was taken every day and there were no disturbances of the bowels, but the patient vomited at different times after the fifth day, gradually losing weight. The wound healed by primary intention. On February 9 the mind seemed somewhat clouded and gradually became more so until death occurred, February 15.

Postmortem.—There was no abnormal discoloration of the skin. The wound in the left inguinal region was healed throughout. There was some emaciation. The heart, lungs, liver, intestines and urinary bladder were normal in appearance. The spleen seemed considerably enlarged. The kidneys also were normal. Both suprarenal bodies were much larger than normal, firmly adherent to the surrounding structures, and densely and uniformly infiltrated with blood so that their appearance was like that of a hemorrhagic infarct. The right suprarenal and the right kidney were submitted to me for further examination. The kidney is quite normal in size and appearance, the capsule free; the right suprarenal body is situated in the usual place at the upper pole of the kidney. It is much enlarged, being 5 cm. in width, 5.5 cm. in height and about 2 cm. in thickness, and so uniformly infiltrated with firmly clotted blood that only a very thin shell of the cortex is recognizable here and there. In places there is some infiltration of blood into the tissues about the suprarenal, but the main hemorrhage is wholly within this organ. On the cut surface it is quite smooth and red. The hemorrhagic infiltration is most intense in the medullary part and appears to be of about the same age everywhere, and microscopically the tissue is uniformly necrotic, no nuclei being demonstrable in the adrenal cells; some of the vessels in the central part are plugged with clots and the mouth of the suprarenal vein is closed by a firm, adherent and yellow thrombus which projects into the vena cava as a small smooth oblong body about 1 cm. in the longest dimension. A short and incomplete segment only of the vena cava accompanies the specimen so that nothing can be said of the condition in other vessels.

In the newborn and in infants and children, hemorrhage into the suprarenal bodies is relatively not uncommon. Recently it has been dealt with quite exhaustively by Arnaud,¹ Hamill² Dudgeon,³ and Litzenberg and White.⁴ The literature also contains reports of instances of more or less extensive hemorrhage into the suprarenal bodies in adults, and in some the clinical and anatomical details are not much different from those in the present case. This is especially true of cases described by Mattei,⁵ Arnaud, Pritchard,⁶ Laignel-Lavastine,⁷ Simmonds,⁸ Munson,⁹ Lissauer,¹⁰ and Lavenson.¹¹ Lavenson gives an excellent and exhaustive

résumé. In some of the cases there is uncertainty as to whether the primary condition was hemorrhage or thrombosis of the principal veins, followed by hemorrhagic infarction. Lissauer believes that in cases studied by him the primary condition was thrombosis, and it seems to me not unlikely that such was the case in the present instance also. Suprarenal hemorrhage does not seem to have been diagnosed during life as yet, and, while there can be no doubt that bilateral suprarenal hemorrhage or hemorrhagic infarction, as in this case, may cause death after distinctive clinical disturbances, the observations so far recorded probably are not sufficient for the reconstruction of complete clinical picture or pictures, although Arnaud concludes his study of a large number of cases of all kinds of suprarenal hemorrhage by dividing them on the basis of symptomatology into three distinct clinical types, viz.: the asthenic type (suprarenal insufficiency), the peritoneal type (peritoneal irritation), and the nervous type. Lvenson adds two more groups: namely, cases of sudden death and cases, so far observed only in children, with purpuric eruptions or hemorrhages in the abdominal viscera.

PROCTOCLYSIS

A SIMPLE METHOD OF ADMINISTERING THE MURPHY TREATMENT

M. IVERSEN, M.D.
STOUGHTON, WIS.

While there are many devices and arrangements for administering the "Murphy treatment"—proctoclysis—most of them are either costly, clumsy or both. The method I have adopted, and which the accompanying illustration makes self-explanatory, has proved satisfactory. It has the added virtue of being easily carried out with material at hand in any hospital.

The parts consist of a fountain syringe or irrigator (A), a stopcock (B), a Y-shaped glass tube (C). From the latter a long rubber tube, ending in a hard rubber or glass tip, extends downward and another piece of tubing extends upward, ending in a U-shaped glass tube (D), the open end of which projects into the irrigator. I have found an 8-candle-power incandescent electric drop light (E) all that is necessary to maintain the temperature of the saline solution.

The stopcock is set so as to permit a flow of from 50 to 80 drops a minute. The vent tube leading from C to D permits the back flow of liquid or the passage of gas when the patient strains. The container should be from 4 to 14 inches above the level of the buttocks.

Therapeutics

PREVENTION OF TUBERCULOSIS

Dr. Noble P. Barnes, Washington, D. C., presented a paper at the International Congress on Tuberculosis (*Interstate Medical Journal*, January, 1909), which states so well the every-day methods of preventing this disease that it is time well spent to review them.

As unhealthy mucous membranes are probably generally the point of entrance into the system of the tubercle bacillus, Barnes emphasizes the necessity for keeping mucous membranes clean and healthy and with free drainage. He emphasizes the necessity for the complete and prompt removal of adenoid vegetations and enlarged tonsils in young children, and believes that the frequently performed tonsillotomy, while removing obstruction, leaves partially concealed or submerged diseased tonsillar tissue that not only harbors various organisms, but offers an open door for the tubercle bacillus. If it is decided that a tonsil is diseased a complete tonsillectomy should be done. Also, partial removal of adenoids does not relieve the congested turbinates, and proper nasal breathing and nasal mucosa drainage can not be established until the nasopharynx is cleared.

The nose itself should be made as free of bony obstructions and mucous membrane hypertrophies as deemed necessary for the free passage of air. If the mucosa is thickened, the use of mild alkaline antiseptic solutions followed by mentholated pure petroleum oil will aid in causing it to become healthy. In simple catarrhal conditions of the larynx and upper bronchial tubes, the inhalation of some mild aromatic antiseptic oil solution is of value.

Barnes believes that the rising toilet of all individuals who possess sensitive mucous membranes, and of those who inhale city dust, should include the employment of a non-irritating nasal douche, and a cold water gargle. "A free change of air in the lungs is next in order, the method depending on the physical condition, and lastly inhalation for from five to ten minutes of mentholated aromatic oils."

From such a morning toilet of the nose and throat, mucus that may have collected during the night is washed off and expelled, the appetite for breakfast is improved, and the mucous membrane is prepared to counteract the ill effect of the dust and bacteria that must of necessity be inhaled during the day.

If the mucous membrane of the nose and throat is unhealthy, Barnes suggests, besides small doses of iron, small doses of iodid. This is certainly good treatment, provided the dose of iodid is very small, perhaps not more than 0.03 to 0.05 gram (or $\frac{1}{2}$ to 1 grain) three times a day.

If a tuberculous process is going on in the lung, Barnes advises against respiratory exercises as tending to prevent the normal healing of the part. This is certainly good advice, as either the exercise is often carelessly ordered by the physician, or the patient or the patient's family, through the reading of popular articles, begins deep breathing at a time when it is positively contraindicated. Later, when a lung has thoroughly healed, graduated respiratory exercises are advantageous. Barnes suggests the following precautions in lung gymnastics, viz.: never expand the chest beyond the degree of comfort for fear of tearing open old wounds or rupturing air cells. 2. The air should be expelled through the nose instead of through the mouth or puckered lips as taught by most teachers of physical culture, because the turbinates are cooled by inhalation, and warmed by exhalation, and the dust caught on the nasal hair and mucous membrane will be forced out instead of being drawn further in."

The mucous membrane of the digestive tract becomes second in importance as a route of tuberculous invasion

in infants and children, and besides the frequent swallowing of human tubercle bacilli in contaminated food, and from putting into the mouth unclean hands and toys, it seems to be a proved fact that bovine tubercle bacillus is pathogenic to children. Besides the necessity for pure, clean, and non-infected food for infants, a primary necessity in this prevention of digestive infection is to keep the things the child puts in its mouth clean, and Barnes believes "the abominable pacifier, which is first put into the nurse's mouth, then rolls around on the floor, and then finally into the baby's mouth, is pernicious and a germ carrier, to say nothing of the deformities of the face and mouth that may occur from such constant sucking." Such "sucking quieters" of the babe create a habit for putting everything into his mouth when he gets a little older, to say nothing of sucking his own dirty fingers, putting pennies and other dirt-carrying things into his mouth, and later as a school child "chewing gum, sucking pencils, nibbling his nails, etc." All such sucking and chewing habits are best prevented by not allowing the babe to acquire such habits.

If the stomach mucous membrane is believed to be imperfect, Barnes believes that a little dilute hydrochloric acid may be needed to cause the stomach to be a proper germ-killing organ. The hydrochloric acid of the stomach not only has its local efficient action, but also stimulates the proper flow of the bile and the proper flow of the intestinal secretions.

Too great care of the child's teeth can not be given. Decayed teeth must be filled or extracted, and Barnes thinks it is many times a fallacy to believe that diseased teeth in children should be left *in situ* for fear of interfering with the proper eruption of the second teeth.

Tuberculous lymph bodies which can be reached Barnes would immediately remove. "Simple enlargements of the lymphatics in children can be reduced by diet, hygiene, and the administration of sodium salicylate and iodid of iron," but if they are tuberculous such treatment will not cause them to become normal, and they must be removed.

As many more eye inflammations in children are tuberculous than was once supposed, more careful attention to cleansing the eyelids in the morning and evening with non-irritating antiseptic lotions seems advisable.

Examination of the ears of infants who are in any way ill should be routine, and the ears should be carefully watched when the child has any kind of a cold, or cries from pain that can not be localized.

Besides the above measures in preventing local inflammations and the catching of cold from local infection, colds may be prevented by proper bathing. Barnes believes the hot bath for the child should be discontinued, and that "the tepid and gradually cooling shower accompanied by friction should be adopted; the temperature depending on the individual case and lowered only to the point of giving good reaction."

He sums up the measures for the prevention of colds and therefore the tendency to tuberculosis as, "proper hygiene of the skin and mucous surfaces; proper hygiene in diet, sleep, and living; avoiding fatigue, long hunger, mufflers, and chest protectors; avoiding dust and poorly ventilated places." No exercise in the open air can overcome the injuries to the child from sitting in foul-aired schoolrooms or sleeping in close apartments, nor can fresh air and good food overcome disease while such wrong living is continued.

New and Nonofficial Remedies

SINCE THE PUBLICATION OF THE BOOK "NEW AND NONOFFICIAL REMEDIES, 1909," THE FOLLOWING ARTICLES HAVE BEEN ACCEPTED BY THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION. THEIR ACCEPTANCE HAS BEEN BASED LARGELY ON EVIDENCE SUPPLIED BY THE MANUFACTURER OR HIS AGENT AND IN PART ON INVESTIGATION MADE BY OR UNDER THE DIRECTION OF THE COUNCIL. CRITICISMS AND CORRECTIONS TO AID IN THE REVISION OF THE MATTER BEFORE PUBLICATION IN THE BOOK ARE ASKED FOR.

THE COUNCIL DESIRES PHYSICIANS TO UNDERSTAND THAT THE ACCEPTANCE OF AN ARTICLE DOES NOT NECESSARILY MEAN A RECOMMENDATION, BUT THAT SO FAR AS KNOWN IT COMPLIES WITH THE RULES ADOPTED BY THE COUNCIL.

W. A. PUCKNER, SECRETARY.

(Continued from page 1835)

ORGANS OF ANIMALS

The discovery of the importance of internal secretions has led to extensive clinical trials with preparations of the so-called ductless glands, and other tissues which elaborate, or are supposed to elaborate such internal secretions. Two of these, the thyroid and suprarenal glands, have given decisive therapeutic results and have become official in the Pharmacopoeia; preparations of the active principle of the suprarenal are described in this book under the heading of "Epinephrin." The other organ products are scarcely beyond the experimental stage, and may therefore be described together. Their active principles have not been isolated, and they are most commonly used in the form of the powdered dried gland. The gross fat and connective tissue should be removed as completely as possible, and the drying should be conducted at a relatively low temperature. The powder is frequently compressed into tablets. It is recommended that the strength of these should be stated in terms of the dried gland. Since there are no tests for the quality, or even identity, of these powdered products, the physician, unless he can himself supervise their preparation, is forced to rely on the general reputation of the manufacturer.

After the description of each gland a list of such preparations as have been submitted to the Council, and which are being marketed in an unobjectionable manner, is given. For the reasons stated, however, the Council disclaims any responsibility for their quality or identity.

PITUITARY GLAND

The removal of this body in animals is followed by symptoms of motor disturbances, depression, emaciation, and rapid death. The infundibular portion of the gland causes, when injected intravenously, a rise of blood pressure and slows but strengthens the action of the heart. It contains a substance soluble in water, and not destroyed by boiling, which is stated to cause dilation of the renal vessels and a marked increase in the secretion of urine. The gland has been found to be abnormal in many cases of acromegaly and so is believed to have an internal secretion acting on the growth of bones. The anterior lobe is claimed to have properties similar to those of thyroid extract.

The drug has a doubtful effect on the circulation when given by the mouth, but the infundibular portion may be useful in cardiac debility. An extract of this part of the gland has been recommended as a diuretic. The results of the use of the gland in acromegaly are uncertain, but the output of phosphates is increased. It may be given at the first symptom of debility or functional disturbances.

DESICCATED PITUITARY SUBSTANCE (ANTERIOR LOBE)— *Armour*.—The anterior lobe from the pituitary of the ox, separated, dried and powdered without the addition of preservative or diluent.

A light grayish yellow powder, having a slight peculiar odor. Partly soluble in water.

One part represents approximately 4.5 parts of the fresh substance. On incineration, it should yield not more than 6.5 per cent. ash.

Action and Uses.—See pituitary gland above.

Dosage.—0.05 to 0.20 Gm. (1 to 4 grains) in powder or tablet.

Manufactured by Armour & Co., Chicago.

DESICCATED PITUITARY SUBSTANCE (POSTERIOR LOBE)—Armour.—The posterior lobe from the pituitary of the ox, separated, dried and powdered without the addition of preservative or diluent.

A light grayish yellow powder having a slight peculiar odor. Partly soluble in water.

One part represents approximately 4.5 parts of the fresh substance. On incineration, it should yield not more than 6.2 per cent. ash.

Action and Uses.—See pituitary gland.

Dosage.—0.05 to 0.20 Gm. (1 to 4 grains) in powder or tablet.

Manufactured by Armour & Co., Chicago.

THYMUS GLAND

Little is known as to the functions of the thymus, but it is believed to have an important relation to growth. There also seems to be some relation between the thymus and thyroid, for the former is frequently abnormal in diseases involving the latter (exophthalmic goiter).

The use of thymus is purely empirical. It has been recommended in the treatment of exophthalmic goiter, rickets, tuberculosis, hemophilia, and infantile marasmus and atrophy; its use in the latter conditions is said to be the most promising. It is claimed to exert a somewhat favorable effect in certain cases of cancer.

MAMMARY GLAND

The extracts of the mammary gland are said to have an effect upon the uterus. They have been used in the treatment of profuse and painful menstruation and of uterine and ovarian tumors, but the beneficial results reported can hardly be accepted until confirmed by farther observations.

PANCREAS GLAND

Indications and suggested uses are similar to those for the mammary and ovary; it has been recommended in artificial menopause, intermenstrual pain and other conditions in which the ovary or corpus luteum are used.

PARATHYROID GLAND

The parathyroid gland, even in small doses, has a pronounced action on the course of the tetany resulting from the removal of or injury to the parathyroid glands. Its use checks the convulsions and removes the feeling of fear, the nausea and diarrhea and has undoubtedly at times greatly prolonged life or saved it while the injured parathyroid glands regained their functions. The fresh gland seems to be more active than the dried commercial preparation.

The drug has been used most successfully in tetany following removal of the parathyroids; its use in idiopathic and other non-operative forms of tetany has been less successful.

DESICCATED PARATHYROID GLAND—Armour.—Desiccated Parathyroid Gland—Armour, consists of the exterior parathyroids of the ox freed from fat, cleaned, dried and powdered, without the addition of preservative or diluent.

A light yellow powder, having a peculiar odor. Partly soluble in water.

One part represents approximately six parts of the fresh tissue. On incineration it should yield not more than 7 per cent. ash. It contains very small amounts of organically combined iodine.

Action and Uses.—See parathyroid gland.

Dosage.—0.006 Gm. (1/10 grain) four times a day.

Manufactured by Armour & Co., Chicago.

TESTICLE

Subcutaneous injections of testicular extracts were claimed to increase muscular energy from 10 to 20 per cent. Oxidation is somewhat increased and extracts of the gland may be used in obesity, but the results are uncertain. It has also been recommended in prostatic hypertrophy and many other conditions.

SPLEEN

Spleen has been used empirically in anemia, chlorosis, myxedema and various other diseases.

OVARY

The ovaries produce internal secretions which are necessary for the proper functioning of the uterus and which also have obscure effects on metabolism and the nervous system. Diminution or cessation of the activity of the ovaries (as at menopause, natural or artificial) often leads to a variety of nervous symptoms; irregularities in their activities seems to be sometimes accompanied by dysmenorrhea. Ovarian substance has been administered, often with apparently good results, for the relief of symptoms following the natural or artificial menopause and in dysmenorrhea, intermenstrual pain, etc.

CORPUS LUTEUM

It is generally recognized that one or more of the most important of the internal secretions of the ovaries originate in the corpora lutea and the latter have been tried recently to a considerable extent in some of the classes of cases in which the entire gland is used. Thus, it is stated that in cases of artificial menopause, following operation, the use of the dried corpus luteum has been followed by great improvement. It may be given in the form of tablets, each of which is composed of a dried corpus luteum, obtained from a pregnant animal, usually a pig; or it may be given as "lutein" in twenty grain doses, three times a day, in some cases given continuously, in others periodically when the discomforts are greatest, and continued for about ten days at a time. The "lutein" is made by squeezing out the corpora lutea from the ovaries of the pig obtained at the slaughter house. The corpora are then rapidly dried, powdered, and compressed into tablets. These preparations are stated to frequently give good results when the ordinary ovarian extract made from the dried tissues of the ovary itself fails.

Corpus luteum has also been recommended in obesity associated with amenorrhea and in other conditions of "ovarian insufficiency" and in dysmenorrhea.

Drevet recommends that an extract of the corpora lutea, prepared as follows, be used: 1 kilo of finely divided corpora lutea are macerated in the cold for forty-eight hours with a mixture of 500 Cc. glycerine, 500 Cc. distilled water and 10 Cc. sulphuric acid. The liquid is filtered, neutralized with soda and the precipitate after being washed, is dissolved in acetic acid and again precipitated. The precipitate is then dried in vacuo. Dose of this extract, 0.04 Gm. to 0.08 Gm. (¼ to 1½ grain) gradually increased to 0.12 Gm. (2 grains).

RED BONE MARROW

Red bone marrow consists largely (more than 90 per cent.) of fat. In new born animals a third or more of this fat consists of lecithin. The marrow of the bones of new-born animals contain iron (up to 1 per cent. or more) in various forms of organic combination. Both lecithin and iron decrease rapidly in the first weeks after birth. The commercial preparations contain very variable amounts of these constituents.

Action and Uses.—Red bone marrow is supposed to stimulate the formation of red blood corpuscles; whatever action it may have in this direction is probably due largely to the iron and lecithin which it contains.

It is recommended in simple and pernicious anemias.

EXTRACT OF RED BONE MARROW.—Extract of red bone marrow is a glycerin extract of the red marrow of bones. It contains about 2 per cent. of proteids, about 0.1 per cent. of lecithin and about 85 per cent. of glycerin.

It is a brownish liquid of an agreeable aromatic taste.

Actions and Uses.—This preparation is claimed to stimulate the formation of the red blood corpuscles.

It is recommended in simple and pernicious anemia.

Dosage.—4 to 8 Cc. (1 to 2 fluidrams) in water, milk or wine, three times a day.

Prepared by Armour & Co., Chicago.

TUBERCULOSIS AND THE INDIAN

Mortality from tuberculosis is said to be far higher among the Indians than among the whites or even among the negroes.¹ It is generally believed, however, that there was no tuberculosis among the Indians previous to the coming of the white men. If it existed, it must have been exceedingly rare. Early histories of the aborigines describe such diseases as smallpox, cholera, filth diseases, insanity and rabies (from the bites of wolves and skunks), but say almost nothing of tuberculosis. As the whites came into contact with the Indians, this disease spread progressively from east to west.

The negative reason for the peculiar mortality from tuberculosis among the Indians is that this race, having come into contact with the disease very recently, has not had time to acquire immunity. For a similar reason, the negro race also has a high consumption mortality: it is very probable that there was no tuberculosis in Africa until the white man took it there. If the condition of the Indian and the negro, who have no racial immunity against tuberculosis, be compared with that of the Jew, who, through the forty centuries of his contact with tuberculosis, has established for himself a comparative immunity against the disease, it is seen that the Jewish race has not only a lower death rate from tuberculosis than the other two, but perhaps the lowest rate of any people.

The positive agencies for the dissemination of tuberculosis among the Indians are their personal and domestic habits. In the old days the nomadic Indians dwelt in more or less temporary abodes. These were well ventilated, since there were no means for making them air-tight. They were dirty enough; but by the time the stench from the filth around them became unbearable, it was time for the inhabitants to move on. They must sometimes have become infected; but the most permanent possessions of the Indians were of such perishable nature, compared to the belongings of civilized people, that diseases can not have been long perpetuated by them. Civilization, however, has provided the Indian with a durable and immovable house—generally a log cabin or rude hut—capable of being hermetically sealed against the air. Now he can shut out the fresh air, as he could not from his tepee. He is not

sufficiently advanced to understand and apply the principles of disinfection; and his belongings, sheltered by four walls and a roof, are much less subject to Nature's process of purification by destruction.

When the virgin soil of the Indian's constitution is prepared by such habits as these and by liberal indulgence in the white man's fire-water, it is natural enough that the seed of tuberculosis should strike deep root there and bring forth abundant harvest of death.

The national government has not been wholly remiss in its attitude toward this matter. The Honorable F. E. Leupp,² Commissioner of Indian Affairs, and Prof. Ales Hrdlicka,³ of the United States National Museum, have been active in the work of saving the Indian from extinction. The Lake Mohonk (N. Y.) Conferences also have been zealously agitating the matter. On the Cattaraugus Reservation, in New York State, an excellent dispensary, a well-equipped hospital, and the Thomas Indian School for Indian Children are maintained. What is being done for the Indian, however, is but a fraction of what should be done; and, if humane instincts will not prompt us to action, enlightened selfishness may furnish a motive. The Indian, in his intercourse with the whites to-day, is a constant disseminator of infection. Self-protection should, therefore, dictate such humane efforts as a dormant sense of justice may fail to inspire.

ANAPHYLAXIS

In a recent contribution to the study of anaphylaxis Biedl and Kraus¹ assert that, at least in dogs, the symptom-complex characteristic of the so-called anaphylactic shock is caused by a profound peripheral vasodilatation with a correspondingly grave fall in blood pressure. The other symptoms—vomiting, diarrhea, anuria, etc.—they regard as secondary to vasodilatation, which is regarded as the underlying primary process. They also found in the anaphylactic state a greatly decreased coagulability of the blood, as well as a marked fall in the number of polymorphonuclear leucocytes. They, furthermore, emphasize that results similar to those obtained by them in anaphylactic dogs follow the intravenous injection into normal dogs of commercial (Witte's) peptone; indeed, they assert that the results in the two cases are so much alike as to be practically identical. They even maintain that they have produced the so-called anti-anaphylaxis—the extinction of hypersensitiveness that follows survival of the acute symptoms produced by a second injection of the foreign serum in sensitized animals—quite as readily by the injection of peptone as by the injection of the foreign serum itself. Reversely, survival of the second injection of foreign serum is said to give a considerable measure of freedom from the poisonous effects of pep-

tone. Biedl and Kraus believe that such striking similarity of results is explainable only on the assumption of the presence in the two cases of substances physiologically identical. On the basis of their results they offer as a hypothetical explanation of the acute phenomena of anaphylaxis the formation in the sensitized animal of a vasodilating substance which becomes fully active on the introduction of a second dose of the foreign protein. Richet,² pioneer investigator in this field, who first introduced the word "anaphylaxis," in discussing the work of Biedl and Kraus, points out that he himself has shown, so long ago as 1902, that in anaphylactic shock there is an extreme and rapid fall in arterial pressure. This fall, however, he regarded and still regards as a secondary phenomenon due to cellular changes especially in the central nervous system. Richet holds that vasodilatation does not explain the vomiting, the diarrhea, the intense itching, the convulsions, the coma, and other symptoms characteristic of anaphylactic shock, especially since such symptoms are not a necessary consequence of even extreme vascular dilatation produced by other means. As to the incoagulability of the blood, his experience indicates that it is not at all constant in anaphylaxis. The toxic effect of Witte's peptone, which, it is well to remember, is a complex substance, after all is in so many ways dissimilar from the anaphylactic shock that the comparison does not help to explain the latter. Consequently, while no doubt exists as to the occurrence of vasodilatation in acute anaphylaxis, we have good reason to believe that the dilatation is a secondary phenomenon and that the primary process must be sought elsewhere than in the peripheral vasomotor apparatus.

THE BIOLOGIC STANDARDIZATION OF DIGITALIS

We publish elsewhere¹ in this issue an abstract of Bulletin No. 48 of the Hygienic Laboratory, Washington, D. C., entitled "The Physiological Standardization of Digitalis." It contains a good deal of material which is of great interest to the physician, because, in addition to giving a complete historical review of the various steps which have led up to biologic standardization of drugs, and an investigation into the accuracy of these methods, it also gives the results of the writers' examination of some of the proprietary preparations of digitalis which are on the market. Three of these non-pharmacopeial preparations compared very favorably with the official fluidextracts as the results given in the table on page 1939 show. With two more preparations, however, the findings were not as favorable, and they furnish examples of the vast difference between theory and fact, or perhaps it might be said between manufacturers' claims and actual conditions. One of these is claimed to have about double the effect on the system that an ordinary fluidextract possesses. In real-

ity, when judged by its effect on animals, it appeared to be considerably weaker than the fluidextracts examined. It would seem also that the manufacturers themselves are not entirely convinced of the increased potency of their own preparation, for when it comes to doses they recommend from one-third to one minim *every hour*, an amount which is certainly not less than that of the official fluidextract, which is from one to two minims and usually given three or four times a day. More striking still were the results obtained with another preparation whose manufacturers claim that it is an aseptic permanent solution of the same strength as the tincture of the United States Pharmacopeia. Of three specimens examined, one seemed to be about half the strength of a tincture, while the other two bottles contained dark, muddy solutions not possessing the characteristic cardiac action of the digitalis series. One of these solutions when injected into the circulation lowered the blood pressure 23 per cent., giving a curve resembling that of the nitrites. The writers of the bulletin point out that this preparation is certainly not invariably a permanent solution, but may deteriorate and be positively harmful. When it is remembered that this preparation is especially recommended for hypodermic administration and that such a method is only employed where a rapid action is desired, the seriousness of the situation becomes more apparent. Such a preparation would be a menace to the "health of the sick."

An important need, emphasized by the appearance of this bulletin, is that of government supervision of the manufacture of preparations belonging to this series in the same way as the government now controls serum manufacture. Of the necessity of biologic standardization there can be no doubt, and while many pharmaceutical houses now maintain laboratories for this purpose there is no uniformity of method or of standard strength to which the preparations on the market under the same name must conform. Each maker has his own standard. The necessity of a uniform standard is great; the incorporation of such a standard in the next pharmacopeia would seem to offer no unsurmountable obstacles.

The appearance of a government bulletin of the scope of the present one and dealing with so valuable and much used a drug as digitalis is of considerable importance. It furnishes another indication of the widespread interest which is being taken in the production of pure drugs of a uniform strength.

SUBSTITUTES FOR THE WASSERMANN REACTION

Since the clinical value of Wassermann's complement-fixation test for syphilis has been pretty firmly established, numerous efforts¹ have been made to devise a substitute that is simple and more generally practicable. Most of these have depended on precipitate forma-

2. Presse méd., 1909, xvii, 249.

1. THE JOURNAL, April 3, 1909, p. 1113.

tion when syphilitic serums are treated with one of a variety of reagents. Thus Klausner, by diluting serum with distilled water, obtained with syphilitic serum a much more abundant precipitate than with other serums. Other observers have obtained similar results, using as a precipitant, dilute alcohol, solutions of lecithin, sodium taurocholate, or sodium glycocholate. But, unfortunately, none of these tests has proved constant enough to be of much value clinically.

A somewhat similar test has been reported by Noguchi,² who systematically examined the various constituents of spinal fluids and blood serums giving a positive Wassermann reaction, and found that the active substances (antibodies) were all precipitated with the englobulin fraction of the proteins, on half saturation with ammonium sulphate. He further found that this fraction was constantly and materially increased in the syphilitic serums he examined, over that in normal and non-syphilitic serums, although there was not a quantitative relation between this increase and the intensity of the Wassermann reaction. Noguchi thinks that this increase in globulin is more constant than the Wassermann reaction, and that it bears a more definite relation to the activity of the disease. He also found an increase in the globulin in the spinal fluid in cases of tabes and general paresis.

His determinations were made by careful gravimetric methods, but he has devised a simple method for clinical use depending on the precipitation of the proteins in the spinal fluid by ten per cent. butyric acid solution. In positive cases a flocculent precipitate appears. In negative cases the fluid remains clear or becomes simply cloudy. He thinks the test is simpler and gives more definite results than Nonne's method of half saturating the fluid with ammonium sulphate. In a modified form he found the butyric acid test applicable to the blood serum.

The increase of globulin in the serum of syphilitics has been previously described. It is probably this which gives rise to the precipitate formed by dilution of the serums in Klausner's reaction. But an increase in globulin has been reported by other observers in the serum of some non-syphilitic conditions as well. Hence, until the test has been extensively tried, it can not be accepted as a reliable substitute for the Wassermann reaction. Better results might be expected from its application to spinal fluids.

WHISKEY AND THE PUBLIC HEALTH

The National Model License League, an organization which claims to be working for the purification of the existing liquor business, has been utilizing a statement made by a distinguished physician in an address to the commercial bodies of Kentucky in their recent convention. Speaking of health matters in that state, this

physician is quoted as saying that for every one death produced by whiskey 1,000 deaths have been caused by the drinking of impure milk; that for every single death produced by the drinking of whiskey there have been 5,000 deaths from the drinking of contaminated water. He prefaced this statement by a request that it should not be misunderstood or misinterpreted, but from the use to which it is being put it has certainly been misinterpreted and the attempt is made to make it still more generally misunderstood. The public is apt to accept generalities of this kind without allowing for the qualifications which may have been in the mind of the speaker. Furthermore, there are very few diseases which have not contributory factors to their mortality, and even moderate drinking habits affect the prognosis of disorders from which a total abstainer is comparatively safe. As a lay journal says, the apparently impressive and prodigious figures are not worth a straw as an argument. Certainly not in the way they are being used here. The case is another instance of the same kind that has heretofore been noticed in THE JOURNAL in which remarks are used in senses entirely different from those intended by the speaker or writer.

DESIDERATA IN BRITISH LIBRARIES

Professor Karl Pearson, the eminent authority on biometrics, writes to *Nature* of May 6, inquiring where a number of medical journals, or certain years of such, can be found in England, stating that they have been looked for at the likely places and it is possible that they exist and have not been found. It seems a curious thing that London, with its library of the British Museum and all its other medical and general libraries, should lack copies of such widely quoted periodicals as *Lo Spallanzani*, the *Archiv f. Psychiatrie u. Nervenkrankheiten* for the eighties, the *International Medical Magazine*, etc. There seems also to be no library in London containing a complete set of university dissertations and degree theses. This last probably would be found to be the case also in many, if not all, of our American libraries, though there are opportunities occasionally of acquiring them at comparatively small cost. Many of these theses contain valuable matter or worked up summaries of our knowledge on their special subjects, and, while they are not absolutely necessary, they may be badly wanted at times. If any one occupied in research wishes to verify his references he needs to have all the conveniences for that kind of work, and, though bibliography in scientific papers may be easily overdone, the facilities for it should not have too many limitations.

THE FRENCH BIRTH RATE

It is said that for the first time in many years the French birth rate is showing an upward tendency. Of late years it has been decreasing or stationary. The increase is small, only about 9,000 for the first six months of 1908, but it was accompanied with a corresponding decrease in the death rate of over 60,000. This would seem to indicate that the conditions that have been troubling the French sociologists for the past few years are improving.

THE ATLANTIC CITY SESSION

We learn as we go to press that the Session at present under way at Atlantic City bids fair to be one of the most successful in years and, though not characterized by any spectacular features, there is every evidence of good solid scientific work. The familiarity of so many members of the Association with Atlantic City and its methods, together with that city's perfected system of arranging for conventions, all tend to make matters move smoothly. The attendance so far is very good and may possibly exceed that of two years ago, though this is not probable. On the first day the registration was over 900, reaching 2,480 on Tuesday. A large number of physicians were in Atlantic City in advance of the convention, having come from other society meetings in the East and also to attend other meetings held at Atlantic City in connection with the Association's convention. Medical men were much in evidence last Sunday both in the hotels of the city and on the Boardwalk. Among other societies meeting at Atlantic City this week are the American Association of Medical Milk Commissions, the American Gastro-Enterological Association, the American Proctologic Society, the American Urological Association and the National Conference of State Medical Examining and Licensing Boards. The House of Delegates transacted its regular business with dispatch. It is impossible to print the minutes of the meeting in this issue of THE JOURNAL, but nearly all of the proceedings will appear in the June 19 issue. The general meeting, which was held according to schedule, was well attended, as were also the Section meetings which commenced Tuesday afternoon. The medical profession of Atlantic City is entertaining the visiting physicians in its usual generous style. A notable feature of the present session is the scientific exhibit; all the space available has been taken, there being nearly fifty participants. Many new features have been introduced and the tuberculosis exhibit is particularly fine. In all, there seems every reason to believe that the 1909 session will be one of the most satisfactory ever held.

Medical News**ALABAMA**

Commencement Exercises.—On April 30, the annual commencement exercises of the Medical Department of the University of Alabama were held in Mobile, and a class of 29 was graduated. The address of the evening was given by Hon. John McDuffie, Monroeville, and John W. Abercrombie, president of the university, presented the diplomas.

Personal.—Dr. Samuel W. Welch, Talladega, has been elected a member of the State Board of Medical Examiners, vice Dr. Edward H. Sholl, Birmingham. Dr. J. E. Shirley has been appointed resident physician of the Mobile City Hospital; Dr. S. S. Stubbs of the Southern Infirmary; Dr. S. C. Spencer of the Providence Infirmary; Dr. R. R. Ivey of the Alabama State Hospital, Tuscaloosa, and Dr. J. R. Oswalt of St. Margaret's Hospital, Montgomery. Dr. Felix H. Craddock has been elected municipal health officer of Sylacauga, and Dr. Braxton B. Pugh of Ironaton. Dr. Rufus L. Milligan has been elected city physician of Montgomery, vice Dr. Gaston J. Greil.

ARKANSAS

Personal.—Dr. William E. McLain has been elected city physician of Argenta. Dr. Joseph J. Moncrieff, Beebe, has been appointed chief medical examiner of the National Consolidated Casualty Company, Little Rock.

City Hospital for Little Rock.—The City Hospital district, Little Rock, is about to issue bonds for \$50,000. The Medical Department of the University of Arkansas has given assurance that as soon as actual work on the hospital is begun it will erect a \$35,000 building beside it. It is believed that the former offers of \$10,000 from the university, and of two lots for a site will be renewed.

Society Meetings.—The Arkansas Medical Society, at its thirty-third annual meeting held in Pine Bluff May 18-21, elected the following officers: President, Dr. James H. Lenow, Little Rock; vice-presidents, Drs. Harvey D. Wood, Fayetteville; Elbert L. Watson, Newport, and Forrest A. Corn, Lonoke; secretary, Dr. Morgan Smith, Little Rock; treasurer, Dr. John S. Wood, Hot Springs; delegate to the American Medical Association, Dr. Eugene C. Hay, Hot Springs; alternates, Drs. Charles C. Price, Douglas, and Buchanan Hatchett, Fort Smith; councilors, first district—Dr. Horace R. McCarrall, Walnut Ridge; third district—Dr. Samuel A. Southall, Lonoke; fifth district—Dr. H. H. Niehuss, Wesson; seventh district—Dr. James C. Wallis, Arkadelphia; and ninth district—Dr. Creed T. Cannady, Cotter; State Board of Medical Examiners, third district—Drs. Frank B. Young, Springdale; Frank B. Kirby, Harrison, and James H. Beard, Gentry; second district—Drs. Fred T. Murphy, Brinkley; Lemuel E. Wallis, Newport, and Gus A. Warren, Blackrock; sixth district—Drs. William S. Stewart, Pine Bluff; John L. Butler, Sheridan, and L. H. Barry, Hot Springs; seventh district—Drs. James C. Wallis, Arkadelphia; James T. Henry, Eagle Mills, and John A. Moore, Lisbon. Dr. C. P. Merriwether was selected as assistant editor of the journal of the society. The society decided to hold its 1910 meeting at Little Rock. At the annual meeting of Carroll County Medical Society, held in Eureka Springs, May 12, the following officers were elected: President, Dr. John D. Jordan; vice-president, Dr. Russell G. Floyd; secretary, Dr. Henry Pace, and delegates to the state society, Dr. Floyd, all of Eureka Springs, and Dr. Charles A. George, Berryville.

COLORADO

State Board Members Appointed.—On May 17, the governor appointed the following members of the State Board of Medical Examiners: Drs. William W. Rowan, Ouray; Miller E. Preston, Denver, and David A. Strickler, Denver.

DELAWARE

Antituberculosis Society Elects Officers.—At the meeting of the directors of the Delaware Tuberculosis Society, held in Wilmington, May 4, the following officers were elected: Honorary president, Dr. John J. Black, Newcastle; vice-presidents, Drs. Harold L. Springer and Irvine M. Flinn, Wilmington; chairman of farm committee, Dr. Peter W. Tomlinson, Wilmington; admission and dismission committee, Drs. Joseph P. Wales, Albert Robin, Irvine M. Flinn, and Harold L. Springer, and chairman of educational committee, Dr. Albert Robin, all of Wilmington.

Governor Appoints Commission.—The governor has appointed the following medical members of the State Tuberculosis Commission: Drs. Peter W. Tomlinson, B. L. Lewis and W. F. Haynes, whose duty it is to arrange dispensaries in each county and make sanatorium arrangements for tuberculosis patients. He also appointed Drs. Harold L. Springer and Irvine M. Flinn, both of Wilmington, members of the State Board of Examiners of Graduate Nurses. He has also issued commissions to Drs. John J. Black, Newcastle, and James J. White, Dover, reappointed trustees of the State Hospital, Farnhurst.

ILLINOIS

Change of Proprietorship.—The interest of Dr. Everett H. Butterfield, Ottawa, in the Ottawa Tent Colony, has been sold to H. B. Pettit, superintendent of the institution, son of Dr. James W. Pettitt, and the entire control of the institution is now in the hands of Dr. Pettit and his son.

Personal.—Dr. George H. Stacy has resigned as pathologist to the Illinois Central Hospital for the Insane, Jacksonville, and will practice in that city. Dr. Martha Hayward has been appointed superintendent of the Aurora City Hospital. Dr. Arthur P. Leipold, Moline, has been elected supreme medical examiner for the state of the Home Fraternal League. Dr. William H. Ludewig has been elected president of the Rock Island Board of Health. Dr. Flint Bondurant has been appointed bacteriologist in the office of the State Board of Health, Springfield.

Smallpox in Illinois.—According to the report of the Public Health and Marine-Hospital Service on May 21, more than

one-eighth of all the smallpox in the United States between January 1 and June 1, was reported in Illinois. Of the total 9,960 cases in the country, 1,275 were reported from Illinois, but only 11 of these were found in Cook county.—Dr. Charles E. Crawford, Rockford, state health officer, is said to have found 72 cases of smallpox in Marengo in 41 families. The patients are all under quarantine, and the regulations are being well observed.

Chicago

Personal.—Dr. William A. Pusey has been elected president of the American Dermatological Association.—Dr. and Mrs. Bernard Fantus will sail for Europe June 15.

Commencements.—At the banquet which closed the commencement exercises of Rush Medical College, June 1, Dr. Henry B. Favill gave an address on "Medicine in the Scheme of Conservation." The president of the university announced that the college will start next year free from debt, which has been cleared away by the generosity of the members of the board of trustees. The degree of doctor of medicine was conferred on a class of 57. Fellowships in special subjects and prizes were conferred on 8 members of the class. The doctorate address was delivered by President Edward J. James of the University of Illinois.—The twenty-seventh annual commencement exercises of the College of Physicians and Surgeons, Chicago, the College of Medicine of the University of Illinois, were held June 5, when a class of 131 was graduated. The doctorate address was delivered by Dr. William E. Quine on "The Doctor and Religion."

INDIANA

April Sickness and Death.—During April, there were reported to the State Board of Health, 3,21½ deaths, equivalent to an annual death rate of 14.3 per 1,000, or an 8 per cent. increase, as compared with April, 1908. There was also an increase in the morbidity of 10 per cent. Deaths under 1 year of age numbered 424, or 13.9 per cent. of the total deaths, and the deaths of individuals over 65 years of age were 1,044, or 33.3 per cent. of the total. Consumption caused 427 deaths, pneumonia 452, or 120 more than for the same month last year. There were 158 cases of typhoid fever reported in 24 counties, with 33 deaths, and 60 cases of diphtheria from 21 counties with 9 deaths. There were reported 176 deaths from violence, 8 of which were homicides and 31 suicides. The most prevalent disease of the month was tonsillitis.

Personal.—Dr. Jacob B. Casebeer, Auburn, went to Ann Arbor for operation May 25.—Dr. Edgar F. Kiser, superintendent of the City Dispensary, Indianapolis, has resigned.—Dr. Charles J. Overman has succeeded Dr. Edwin O. Harrold, resigned, as city health officer of Marion.—Drs. William F. Sharrer and William R. Quick have been appointed members of the board of health of Delphi.—Dr. Solomon G. Smelser, Shirley, has been appointed a member of the State Board of Medical Registration and Examination.—Drs. Charles P. Cook and Walter J. Leach, New Albany, have left for Europe.—Drs. J. H. William Meyer and Bo Carr Bowell have resigned as members of the LaPorte Board of Health.—Dr. Edward Linthicum, Evansville, was operated on in St. Luke's Hospital, Chicago, recently.—Dr. Harry N. Swezey has been made a member of the board of public works of Marion.—Dr. Jonas Stewart, Anderson, slipped and fell down a stairway May 15, sustaining severe injuries.—Dr. Calvin I. Fletcher, Indianapolis, has returned from Europe.

KENTUCKY

Railway Surgeons Meet.—The fifth annual meeting of the Kentucky State Railway Surgeons' Association was held in Newport May 26 and 27. The following officers were elected: President, Dr. John L. Phythian, Newport; vice-presidents, Drs. Charles G. Daugherty, Paris; Albert S. Brady, Greenup, and James B. Kinnaird, Lancaster, and treasurer, Dr. Clarence H. Vaught, Richmond. The association decided hereafter to publish its own journal, and to hold its next meeting at Ashland in May, 1910.

Personal.—Dr. Florence Meder, Louisville, has been promoted to second assistant physician at the Central Kentucky Hospital, Lakeland, vice Dr. John K. Wood, Bowling Green, resigned on account of ill health, and Dr. Samuel Young, Murray, has been named third assistant physician.—Dr. Frank P. Strickler, Elizabethtown, has been elected president, and Dr. Charles Z. Aud, Cecilian, secretary and health officer, of the Hardin County Board of Health.—Dr. James W. Griffin, Lewisport, has been elected president and Dr. James W. Knox, Lewisport, re-elected health officer and secretary of the Board of Health of Hancock county.

LOUISIANA

Personal.—Dr. George Dock, New Orleans, sails this week for England and the continent. He will attend the International Medical Congress at Buda-Pest.—Dr. E. Dunbar Newell has moved from St. Joseph to Chattanooga, Tenn., where, with his brother, Dr. Edward T., he is in charge of the Newell & Newell Infirmary.—Dr. Irving Hardesty, professor and head of the department of anatomy in the University of California, has been appointed to a similar position in Tulane University, New Orleans.—Dr. Joseph A. Estopinal, New Orleans, secretary of the State Board of Health, has resigned to accept the position of special medical inspector in Havana. He has been succeeded by Dr. Edward S. Kelley.

MARYLAND

Presentation.—Dr. James S. Woodward, who for more than twenty years has been resident surgeon to the Maryland Steel Company, at Sparrows Point, near Baltimore, and who recently resigned, on May 27, was presented by his friends with a silver loving-cup, whose three handles bore the engraved words "Physician," "Neighbor," "Friend."

Charge Against Justice of the Peace.—Dr. Marshall L. Price, secretary of the State Board of Health, has filed with the governor charges against Justice of the Peace Hartle, Hagers-town, alleging that the justice dismissed the case of an undertaker of Williamsport who was accused of the violation of the law relating to burial permits, without hearing the witness for the state, and that he had conspired with a public school teacher, charged with permitting pupils not vaccinated to attend the school, thereby defeating the administration of justice. The governor has asked for a prompt explanation from the justice.

Baltimore

Commencement.—Maryland Medical College celebrated its eleventh annual commencement June 1, when degrees were conferred on a class of 31 by Dr. Harry Gross. The introductory address was made by Dr. Bernard P. Muse, and the address to the graduates was made by the secretary of state of Maryland, Hon. N. Winslow Williams.

Personal.—Dr. William F. Shellenberger of the resident staff of Johns Hopkins Hospital, was operated on for appendicitis May 25.—Dr. Henry H. Imhof was slightly injured in a street car collision, May 26.—Dr. Anna D. Schultz has been elected president of the Alumni Association of the Woman's Medical College.—Dr. J. Clagett Robertson was operated on at St. John's Hospital a few days ago.—Dr. Silas Baldwin was injured by a runaway horse, May 30.—Dr. D. C. Absher, who was operated on at University Hospital for appendicitis, May 18, has recovered.—Dr. J. T. Coughlin has been appointed chief resident physician of St. Joseph's Hospital, vice Dr. E. G. McFarland.—Drs. W. Preston Miller and William T. Watson sailed for Europe June 3.—Dr. Llewellys F. Barker has gone to Europe and Dr. Roland Whitridge to Spain for the summer.—Dr. William S. Thayer will visit Dr. William Osler in Oxford this summer.

MICHIGAN

Personal.—Dr. Oscar C. Breitenbach, Escanaba, has been removed from Wesley Hospital, Chicago, to Evanston, Ill., and his condition is much improved and speedy convalescence is anticipated.—Dr. John W. Bosman, Kalamazoo, has been appointed local surgeon for the Grand Trunk Railroad.—Dr. Clyde C. Slemmons has been elected city bacteriologist of Grand Rapids.

April Mortality.—During April there were 3,394 deaths reported to the department of health, equivalent to an annual mortality of 15.5 per 1,000. Of these, 615 were of infants under 1 year of age; 217 of children from 1 to 5, inclusive, and 1,140 of individuals 65 years of age or over. Chief among death causes were pneumonia, 317; tuberculosis, 254; violence, 150; cancer, 139; influenza, 74; measles, 59; meningitis, 55; diarrhea and enteritis, 46; typhoid fever, 40; diphtheria, 38; whooping cough, 27, and scarlet fever, 16.

MISSOURI

Personal.—Dr. Thomas E. Graham has resigned as assistant physician at State Hospital No. 2, St. Joseph.—Dr. Frank B. Hiller, Kahoka, has been appointed a member of the State Board of Health, vice Dr. Robert H. Goodier, Hannibal, and Dr. Ernest F. Robinson, Kansas City, to succeed Dr. Walter S. Thompson, Armstrong.—Dr. John M. Bell has resigned as a member of the faculty of Ensworth Medical College, St.

Joseph.—Dr. Porter E. Williams, superintendent of State Hospital No. 1, Fulton, retired from that position June 8.

St. Louis

Memorial Meeting.—A memorial meeting was held by the St. Louis Medical Society, May 30, at which memorial addresses were delivered by Dr. Willard Bartlett on "Dr. Hugo A. Auler," by Dr. Albert H. Meisenbach on "Dr. Benno Bribach," and by Dr. Henry J. C. Sieving on "Dr. Hugo W. Bartscher," and by Dr. William M. Baker on "Dr. Michael P. Reynolds."

New Building for Medical School.—Dr. William H. Warren, dean of the Medical School of Washington University, announced May 26, at the annual banquet of the Alumni Association, that a \$250,000 building is to be erected on the university campus for the use of students during the first two years of their medical course. On May 27, the annual commencement exercises were held, when the degree of M.D. was conferred by Chancellor David Franklin Houston of the University, on a class of 48.

NEW YORK

Commencement.—The annual commencement exercises of Albany Medical College were held May 18. The essayist was Dr. William H. Davidson, the address to the graduating class was given by Dr. Abraham Jacobi, New York City, and Rev. Charles A. Richmond, acting chancellor of Union University, conferred degrees on a class of 40.

New York City

Fire in Hospital.—In a fire which occurred in the children's ward of the King's County Hospital, Brooklyn, May 22, sixty crippled children were removed by physicians and nurses uninjured.

Laboratory for Inoculation Experimentation.—Plans have been filed for a laboratory to cost about \$10,000, to be constructed on the roof of the College of Physicians and Surgeons for the purpose of inoculation experimentation.

Personal.—Dr. Louis L. Seaman returned from Africa, June 4.—Paul A. Lewis has been appointed associate in pathology, F. Peyton Rous, assistant in pathology, and Angelia M. Courtney, scholar in chemistry by the board of directors of the Rockefeller Institute for Medical Research.—A dinner was tendered by the sisters in charge of St. Mary's Hospital, Jamaica, May 27, to Drs. James J. Crawford, Albert L. Voltz, August G. Maron, and Hanford Pattengill, present and past internes of the hospital, and each of the guests of honor was presented with a physician's hand satchel.—Dr. and Mrs. John E. Weeks sailed for Europe May 28.

Buffalo

Commencement.—The annual commencement exercises of the University of Buffalo were held May 28. The principal address was delivered by Mr. Adelbert Moot.

Personal.—Drs. Lucien Howe and F. Park Lewis have returned from Naples.—Drs. James H. Carr and J. Walter Fitzgerald have started for Europe.—Dr. William G. Taylor has returned after a two months' vacation in Cuba and Mexico.

Hospital Dedicated.—The Harrington Hospital for Children of the Buffalo General Hospital was dedicated with appropriate ceremonies May 28. Charles W. Pardee, president of the General Hospital, presided and delivered the principal address. The building, which is a memorial to the late Dr. Devillo W. Harrington, is located on Goodrich street, directly back of the General Hospital. The building is constructed of buff brick and iron; is fire-proof, two stories in height, with a main building and two wings which enclose a court. The top floor of the building is to be devoted to the use of nursing infants, mothers, and young children. The main floor will be devoted entirely to medical and surgical wards, and rooms for older children, and the basement will be used for isolation cases and for observation of suspicious cases.

OREGON

New Hospital.—Multnomah county has secured possession of the site for the county hospital at Fourth and Hooker streets, Portland, and in a few weeks the building will be ready for occupancy. It will accommodate about 100 patients.

Elections.—At the annual meeting of the Portland City and County Medical Society, held in Portland, May 19, the fol-

lowing officers were elected: President, Dr. Alan W. Smith; vice-president, Dr. Alpha E. Rockey; secretary, Dr. George S. Whiteside; treasurer, Dr. Stuart H. Sheldon, and Board of councilors, Drs. Joseph A. Pettit, Ben Norden and Luther H. Hamilton. It was decided to continue the meetings through the summer months, and four additional vice-presidents were selected to preside when occasion required, namely, Drs. Noble W. Jones, Ferdinand H. Dammasch, Robert J. March, and Albert E. Mackey.—The annual meeting of the Southern Oregon Medical Association was held at Grass Pass May 11. Dr. Robert J. Conroy, Medford, was elected president; Dr. Beaver, Ashland, vice-president, and Dr. Alvane C. Seeley, Roseburg, secretary-treasurer.

PENNSYLVANIA

Philadelphia

Personal.—Drs. J. A. Bayard Kane and George W. Bailey sailed for Europe June 5.—Drs. Anna L. Bacon and Mary J. Rochelle were appointed probation officers of the Juvenile Court, June 4.—Dr. John W. Rhein, who was operated on in the Howard Hospital recently for appendicitis, is convalescing.—Dr. Henry W. Stelwagon entertained Dr. George Pernet of London, Eng., and the members of the American Dermatological Society at luncheon at his residence, June 3.—Dr. and Mrs. James A. Irwin sail from New York for Italy, June 12.—Dr. W. M. Late Coplin, director of the Jefferson College Hospital, was presented with a silver loving-cup by the members of the hospital staff, June 7.

Commencements.—The eighty-seventh annual commencement of Jefferson Medical College was held June 7. A class of 140 was graduated and the annual address was delivered by Col. William C. Gorgas, Medical Corps, U. S. Army, and president of the American Medical Association, who spoke on "Sanitation of the Isthmus of Panama." The degrees were conferred by the president, Hon. William Potter.—The twenty-ninth annual commencement of the Medico-Chirurgical College was held June 5, when a class of 80 received diplomas and the annual address was delivered by the Hon. Chauncey M. Depew of New York. The degrees were conferred by the Hon. Henry F. Walton, president of the Board of Trustees.

RHODE ISLAND

State Society Meeting.—The ninety-eighth annual meeting of the Rhode Island Medical Society was held in Providence, June 1. The following officers were elected: President, Dr. Eugene Kingman, Providence; vice-presidents, Dr. Augustine A. Mann, Central Falls, and Dr. Frederick T. Rogers, Providence; secretary, Dr. Stephen A. Welch, Providence; treasurer, Dr. George S. Mathews, Providence; auditor, Dr. William H. Buffum, Providence; curator, Dr. William J. McCaw, Providence, and delegate to the American Medical Association for two years, Dr. John Champlin, Westerly.

VIRGINIA

Faculty Elects Officers.—At the annual meeting of the faculty of the Medical College of Virginia, Richmond, held May 29, Dr. William H. Taylor was re-elected chairman; Dr. Christopher Tompkins, dean, and Dr. Frank M. Reade, secretary.

Elections.—Members of the Alumni Society of the University College of Medicine, Richmond, elected the following officers, May 19: President, Dr. H. B. Mahood, Emporia; vice-presidents, Drs. Joseph N. Barney, Fredericksburg; Joseph B. Bailey, Clayville, and Wyatt S. Beazley, Richmond; secretary, Dr. McCaw Tompkins, Richmond; assistant secretary, Dr. Daniel T. Bailey, and treasurer, Dr. Frank H. Beadles.—The Virginia Conference on Charities and Corrections, at its meeting in Lynchburg, May 18, elected J. T. Mastin, Richmond, president; Dr. Lawrence T. Royster, Norfolk, vice-president, and Drs. William F. Drewry, Petersburg; Roy K. Flannagan, Charlottesville, and Ennion G. Williams, Richmond, members of the executive committee. Surgeon Charles B. Wertenbaker, Norfolk, P. H. and M.-H. Service, prepared a paper on "Practical Methods for the Suppression of Tuberculosis in Virginia," which was read by Dr. Ennion G. Williams in the absence of the writer. He advocated the formation of a state antituberculosis league with representatives, and that there be organized simultaneously in every city, town and village in the state a branch of the league in order that the work of suppression of tuberculosis may be started at once.—A postgraduate school for physicians was organized by the Augusta County Medical Society at Staunton, May 12, with the following officers: Dean, Dr. Marshall J. Payne; vice-dean, Dr. John B. Catlett, and recorder, Dr. Kenneth Bradford.—At the annual meeting of the University College General

Alumni Association in Richmond, May 17, the following officers were elected: President, Dr. George A. McAllister, and vice-presidents, Dr. C. T. Womack, Martinsville, of the dental department, and Miss Maude Lambert, Roanoke, of the pharmacy department.

GENERAL NEWS AND COMMENT

A Well-Merited Honor.—The honorary degree of doctor of science was conferred on Surgeon Rupert Blue, U. S. P. H. and M.-H. Service, by the University of Maryland, at its recent convocation, on account of the services rendered by Dr. Blue during the recent epidemic of bubonic plague in San Francisco.

Psychologists Meet.—At the sixty-fifth meeting of the American Medico-Psychological Association held in Atlantic City, June 1-4, the following officers were elected: President, Dr. William F. Drewry, Petersburg, Va.; vice-president, Dr. Charles W. Pilgrim, Poughkeepsie, N. Y.; and secretary and treasurer, Dr. Charles G. Wagner, Binghamton, N. Y.

Dermatologists Elect Officers.—At the annual meeting of the American Dermatological Society, held in Philadelphia, June 3-4, the following officers were elected: President, Dr. William A. Pusey, of Chicago; vice-president, Dr. Grover W. Wende, of Buffalo, N. Y., and secretary and treasurer, Dr. James McF. Winfield, of Brooklyn, N. Y. Dr. Alfred Fournier, of Paris, France, was admitted to honorary membership. The next meeting of the association will be held in Washington in 1910.

Academy Election.—At the annual meeting of the American Academy of Medicine, held in Atlantic City, June 7, the following officers were elected: President, Dr. James H. McBride, Pasadena, Cal.; vice-presidents, Drs. Philip Zenner, Cincinnati; W. Blair Stewart, Atlantic City; Ruth Webster Lathrop, Philadelphia, and Hanau W. Loeb, St. Louis, and secretary-treasurer, Dr. Charles McIntire, Easton, Pa. (re-elected). Contract practice was discussed as a solution for the problem of securing medical care for wage-earners at a small cost.

Climatologic Meeting.—At the annual meeting of the American Climatological Association, held in Fortress Monroe, Va., June 4-5, the following officers were elected: Presidents, Dr. Edward R. Baldwin, Saranac Lake, N. Y.; vice-presidents, Drs. James M. Anders, Philadelphia, and H. Longstreet Taylor, St. Paul, Minn.; secretary-treasurer, Dr. Guy Hinsdale, Hot Springs, Va.; councilor, Dr. Charles E. Quimby, New York City; representative to the executive committee of the Congress of American Physicians and Surgeons, Dr. Roland G. Curtin, Philadelphia, and alternate, Dr. Thomas Darlington, New York City.

Surgeons' Annual Meeting.—The annual meeting of the American Surgical Association was held in Philadelphia June 3-5. The principal interest was centered in the symposium on "Thoracic Surgery," which was opened by a paper presented by Professor Friedrich, of Marburg, Germany. Professor Tuffier of Paris, France, who was to have read a paper in conjunction with Professor Friedrich, did not arrive. The following officers were elected: President, Dr. Rudolph Matas, New Orleans; vice-president, Drs. John M. T. Finney, Baltimore, and George H. Monks, Boston; secretary, Dr. Robert G. LeConte, Philadelphia; recorder, Dr. Richard H. Harte, Philadelphia, and treasurer, Dr. Charles A. Powers, Denver. The society will meet next year in Washington.

Conference of Charities and Corrections.—The National Conference of Charities and Corrections will be held in Buffalo, N. Y., June 14-16, inclusive. In connection with the conference, there will be exhibits by the Playground Association of America of model playgrounds; by the Committee on Children, who will illustrate the modern methods of work for dependent children; by the George Junior Republic, on what the boy can do; and by the Committee on Families and Neighborhoods on plans for removal of congestion in great cities. The following topics on the program are of special interest to the medical profession:

Industrial Insurance—Lee K. Frankel.
Statistics Relating to Children—Homer Folks.
Report of the Committee on Defectives.
Progress in the Care of the Insane—Frank B. Sanborn.
Care of the Criminal Insane—Dr. Thomas C. Fitzsimmons.
The Eastern New York Custodial Asylum—Franklin B. Kirkbride.
What is Being Done in the Psychological Study of the Feeble Minded—Dr. Henry H. Goddard.
Effects of Industry of Women and Children in the Stock Yards District—Miss Mary E. McDowell.
Statistics of Public Outdoor Relief—Dr. Thomas J. Riley.
After Care of Institution Children—Brother Barnabas.

Public Recreation—Dr. L. H. Gullick.
Sending Consumptives from Home—Rev. W. S. Friedman.
Means of Safeguarding the Sale of Narcotics—William Jay Schiefelin.
The Medical Supervision of Schools—Dr. George H. Leslie.
Press and Publicity in Child-caring Work, Public Health Work, etc.
The Food Supplies of Charitable and Semi-Charitable Institutions—Dr. Harvey W. Wiley.
Diet for Tuberculous Patients—Dr. Herbert Maxon King.
The Responsibilities and Opportunities of a Health Officer—Roy Smith Wallace.
The Coordinate Responsibilities of Boards of Health, Boards of Education and Park Boards in Relation to the Welfare of Children—Dr. Luther H. Gulick.
Responsibilities of Civic Authorities in Relation to Immigrants—Dr. Peter H. Bryce.

The Carroll Fund.—The following subscriptions have been received since the last report:

Medical officers of the army.....	\$ 40.00
Illinois State Medical Society, Ottawa, Ill.....	500.00
North Dakota Medical Assn., Casselton, N. D.....	100.00
Adams County Medical Society, Natchez, Miss.....	20.00
New York and New England Assoc. Railway Surgeons, Oswego, N. Y.....	5.00
Dr. H. McM. Painter, New York City.....	10.00
Dr. H. A. L. Ryffogel, San Francisco, Cal.....	5.00
Dr. Harold Seidelin, Merida, Yucatan, Mexico (U. S. Cur.)	4.99
Dr. W. S. Gardner, Bronx, New York City.....	1.00
Dr. Hermann Grad, New York City.....	5.00
Dr. Calvin Gates Page, Boston, Mass.....	2.00
Medical Society of the Borough of the Bronx, New York..	25.00
Dr. H. S. Steensland, Syracuse, N. Y.....	3.00
Louisiana State Medical Society.....	150.00
Calhoun County Medical Society, Battle Creek, Mich.....	15.00
Dr. W. F. Grinstead, Ottawa, Ill.....	50.00
Dr. Frank Billings, Ottawa, Ill.....	25.00
Dr. J. F. Percy, Ottawa, Ill.....	25.00
Dr. E. W. Weis, Ottawa, Ill.....	5.00
Dr. Joseph L. Abt, Ottawa, Ill.....	5.00
Dr. H. A. Pattison, Ottawa, Ill.....	5.00
Dr. C. D. Pence, Ottawa, Ill.....	5.00
Dr. G. W. Greene, Ottawa, Ill.....	5.00
Dr. V. A. McClanahan, Ottawa, Ill.....	1.00
Dr. J. P. Simpson, Ottawa, Ill.....	1.00

Previously reported \$1,012.99
4,155.67
\$5,168.64

The debt on the Carroll property to-day amounts to \$7,150. The interest on the \$5,000 mortgage (\$125) will fall due June 15. There is on hand in bank to-day to pay this indebtedness \$5,700.82, which leaves \$1,449.18 to be raised. The profession of this country will certainly give this amount to save the home of the widow of James Carroll.

LONDON LETTER

(From Our Regular Correspondent)

LONDON, May 22, 1909.

Reform of the Indian Medical Service

The vast native population of India has for many years been dependent for medical treatment almost entirely on the medical officers of the Indian army. Naturally, the strain of even the hospital treatment of serious disease—which is all that could be attempted—has been very great on this service. The government has at last decided that no further increase of its civil work can be allowed, and that it would be a great advantage to India if physicians would establish themselves there in private practice as in other parts of the empire without entering the army service. As usual, the problem how they are to be paid does not seem to have troubled the government. The Indian population is abjectly very poor and very few could afford even the most modest fees.

A Memorial to Harold Barnard

A committee composed of members of the staff of the London Hospital, has been formed to publish a memorial volume of their late colleague, Mr. Harold Barnard, whose death was announced a short time ago in THE JOURNAL. It is proposed to publish a memorial volume containing all his contributions to abdominal surgery, illustrated by drawings by two of his pupils—Dr. F. Wood Jones and Mr. S. Beale—who had been engaged by Barnard to make them from his specimens.

PARIS LETTER

(From Our Regular Correspondent)

PARIS, May 27, 1909.

Insurance of the Physician Against Civil Professional Liability

The physician is always exposed to action at law for errors, real or pretended, committed in the course of medical treat-

ment or of a surgical operation. Recently, a woman made a complaint to the Parquet of the Department of the Seine, concerning the death of her son under chloroform anesthesia administered in a Paris hospital for an operation. The woman asserts that the chloroform was administered by an interne without the surveillance of the operating surgeon, and contends that this fact constitutes a grave fault. In course of law the woman will be able to bring a civil action and claim heavy damages. Proceedings of this kind have suggested to certain insurance companies, which are always seeking to extend their field, to offer physicians insurance against this civil liability. By means of a moderate premium this insurance will make it possible for the physician to protect himself from payment of damages, often very heavy; and, further, it will relieve him from the vexations and worry of a lawsuit. Whether these advantages are real or problematical, there is a question which appears much more important, namely, whether such insurance is not incompatible with the professional dignity of the physician; and moreover—an indication of the times!—in one of our medical journals, we read under the heading, "Notice to the Medical Profession," the following advertisement: "In consequence of an agreement between this journal and La Foncière, one of the oldest and most important insurance companies in France, our subscribers are gratuitously insured against their civil professional liability. By the sole fact of paying their subscription they are covered during its course to the extent of 2,000 francs against pecuniary liabilities on account of bodily accidents involving their civil responsibility." The journal adds that by signing a supplementary personal contract and paying a premium, the subscriber may extend the gratuitous guarantee of 2,000 francs to a much greater figure.

Medical journals ought truly to show themselves more solicitous for the dignity of our profession and for the true interests of the body medical. It is satisfactory to know that this question of insurance against civil professional liability was recently discussed at the *Association de médecins* of Geneva, and that the essayist, Dr. Eugene Patry, showed himself in his conclusions, which were unanimously adopted by the association, distinctly opposed to such insurance. Regarding it first from a practical viewpoint, Patry thinks that the insurance company, seeking to make the greatest possible profits, will not always keep its engagements to the physician and will not cover all the cases. But alongside its more or less problematical advantages, medical insurance against civil liability presents also tangible inconveniences; for, if it should come into conflict with morals, it would risk diminishing the confidence of the public in physicians, which is the very foundation of our career. The Geneva association agrees with Dr. Patry, that it is more dignified for the physician courageously to bear alone the liability for his actions, than to cover himself by insurance. The only case in which medical insurance, according to Dr. Patry, can be justified, is when the physician has under his orders a medical or nursing *personnel* for whom he is civilly responsible. It is quite natural that in such case, a confrère, not wishing to be held responsible for the operative fault of an assistant or for an error in the administration of a remedy, should insure his *personnel*; but in such a case the insurance should clearly comprise only the errors of the *personnel* under the orders of the chief of service, and not those made by the chief himself.

Compulsory Notification of Contagious Diseases

The law of 1902 imposes on the physician in charge of the case the obligation of reporting a contagious disease. The medical profession has always protested against this regulation, and about six months ago the Academy of Medicine passed a resolution that the obligation should be binding jointly on the head of the family, or head of the establishment and the physician in charge (*THE JOURNAL*, Dec. 5, 1908, p. 1985). A draft of a law has been laid before the senate which places on the head of a family or of an establishment the obligation of making the notification after the physician has warned him of the nature of the malady. The physician is under obligation to present to his patient a notification bulletin, for which he is to demand a receipt. In case the physician does not receive within forty-eight hours an acknowledgement of the bulletin from the sanitary authority, he must make the notification himself. In case the interested person should refuse to give the prescribed receipt, the physician is required to make a notification. Refusal to comply with the law is to be punished by fines varying from 50 to 100 francs (\$10 to \$20).

A Physician Sentenced for Giving Fraudulent Certificates

A Paris physician has just been sentenced to three months in prison, a fine of 100 francs (\$20), and a year's suspension from the practice of his profession for issuing to a laborer a fraudulent medical certificate which permitted the latter, though completely recovered from an injury incurred in his work, to draw an invalid's half-pay from his employer while working for another employer.

BERLIN LETTER

(From Our Regular Correspondent)

BERLIN, May 21, 1909.

Appendicitis—A Collective Investigation by the Berlin Medical Society

Three years ago the Berlin Medical Society determined to institute a collective investigation on appendicitis in the practice of Berlin physicians and hospitals, in order to clear up some unsettled points regarding this disease. A commission was chosen under whose direction the statistical investigation was made which included the entire year 1907. Prof. Albin and Rotter reported the results for the commission at the meeting of the society on May 12. The participation of practicing physicians in the investigation was, as usually happens, quite insignificant; altogether scarcely 8 per cent. reported their experience. On the other hand, the cases treated in the hospital were quite completely reported; 2,705 cases of acute typhlitis were reported, of these 2,365 were in hospital, 340 at home. The mortality in the hospital cases was 214 (9 per cent.), of those treated at home 6 (1.7 per cent.) there were 1,344 operations in hospitals with 197 deaths (14.6 per cent.), 105 were operated on on the first day with the mortality of 1 (0.9 per cent.), on the second day 318, mortality 23 (7 per cent.); the total mortality of cases operated on in the first two days was 5.6 per cent. On the third day and after (late operation) there were 921 operations with a mortality of 18.8 per cent. (third day 238 operations, mortality 23 or 10 per cent., later operations 683, mortality 150 or 23 per cent.); 1,021 were not operated on, either because it was not necessary or because they were hopeless cases; the mortality was 17 (1.6 per cent.). Different ages showed marked differences in the mortality (0-10 years, mortality 17.4 per cent.; 10-20, 5.3 per cent.; 20-30, 10 per cent.; 30-50, 21 per cent.; 50-70, 80 per cent.). Interval operations were carried on for chronic appendicitis in 97 cases, after an acute attack in 805 cases, total 902 cases with a mortality of 9 (0.9 per cent.). As the result of this investigation Prof. Rotter affirms the principle that the early operation, under all circumstances, promises the best results.

Mortality in the Larger Cities of Germany

According to a publication by the Imperial Health Office, the population of 327 German cities with at least 15,000 inhabitants increased in 1907 from 20,900,000 to about 21,500,000, the number of live births was reduced from 647,541 to 645,686, and the number of stillbirths increased from 20,165 to 20,282. The mortality figure has fallen a little. The mortality of infants per 100 born living sank from 18.6 to 17.1. As far as the causes of death are concerned, there was an increase in deaths from diseases of the respiratory organs, scarlet fever, diphtheria, puerperal fever, and accidents but a decrease in mortality from typhoid, measles, pertussis, gastrointestinal catarrh and suicide. The mortality of tuberculosis has proportionately decreased.

The Fight Against Lupus

The commission appointed to conduct the campaign against lupus proposes to favor the establishment of lupus sanatoria, to assist in the provision of apparatus for phototherapy, to favor the establishment of rooms for lupus patients in the neighborhood of the sanatoria, to provide for the gratuitous treatment and assistance in other ways of needy lupus patients, and to develop as much as possible the methods for the treatment and care of lupus. That increased efforts are necessary to combat lupus has been shown by a collective investigation according to which the number of known lupus patients under treatment in Germany is about 11,000 and the entire number of lupus patients in Germany is estimated at about 30,000.

Death of Professor von Ranke

A few days ago Professor von Ranke, formerly director of the Munich children's clinic, died at the age of 79. He was educated at the university under teachers like Johannes

Müller, Gorup-Besanez, Romberg, and Wunderlich, and was an assistant of Johannes Müller and Hugo Mohl. He went in 1854 to London as house physician of the German hospital, and served under the British government in 1855 and 1856 as civilian surgeon in Smyrna and the Crimea. In 1859 he entered the faculty at Munich. In 1866 he established the children's polyclinic in Munich, one of the first children's polyclinics in Germany. He has published numerous studies on metabolism, especially of children, as well as a large number of investigations in clinical pediatrics. He was one of the first to make a trial of O'Dwyer's intubation of the larynx and to publish his results. Three years ago he resigned his position as director of the children's clinic, and was succeeded by Professor Pfaundler, a pupil of Escherich.

VIENNA LETTER

(From Our Regular Correspondent)

VIENNA, May 21, 1909.

Memorial to Auenbrugger

On May 18 a commemoration tablet was unveiled in memory of the centenary of the death of Leopold Auenbrugger, who was the first to use percussion of the chest in diagnosis. He was born in Graz in 1722. His studies of physical phenomena led him to apply the rules of acoustics to medicine and his work on examination of the thorax by a new and wonderful method contains much of what is known at present of percussion. Dr. Auenbrugger did not live to see the universal adoption of his discovery, for it was several years before the bulk of the profession had become convinced of the accuracy and truth of his observations. The method was rediscovered later on several times in different countries, but this does not detract from the priority and usefulness of Auenbrugger's discovery. The Vienna Medical Society (*Wiener medicinisches Doktorenkollegium*) celebrated the day impressively, and some of the descendants of the physician were present at the ceremony of unveiling the tablet.

The German Birth Rate in Austria

In an interesting compilation of statistical data, Dr. Hainisch recently pointed out that the vitality of the German race among the numerous nations composing the Austrian empire was remarkably high. In 1880-1885 the excess of births was in this country 5.17 per 1,000 Germans, amongst the northern Slavonic nation, 7.73 the southern Slavs, and 8.34 amongst the Italo-Slavs, in Tyrol the Germans had a rate of only 0.31 as against one of 5.92 of the purely Italian population. Regular and constant records kept by the statistical bureau of the ministry of the interior reveal a distinct and constantly increasing tendency in the German race to improve its vitality and lower its mortality. Thus the years 1901-1905 show that the excess of births over deaths in the purely German districts is now 9.58 per 1,000, among the northern Slavs 11.88, among the southern Slavs 10.63, while Tyrol showed 7.95 for the German part of the population, but 8.50 for the Italian component. The German increase of population was even smaller than that of the other nations, but it had increased by 85 per cent. during the last twenty years.

Pharmacology

DIGITALIS AND ITS STANDARDIZATION

The Need of Biologic Methods of Determining the Activity of the Drug

The Hygienic Laboratory of the Public Health and Marine-Hospital Service has recently added another contribution to its already long list of publications. Bulletin No. 48, on "The Physiologic Standardization of Digitalis," is written by Dr. C. W. Edmunds of the University of Michigan at Ann Arbor, who was working on the subject at the Hygienic Laboratory last summer, and by Dr. Worth Hale, assistant pharmacologist in the Hygienic Laboratory. The bulletin deals with a variety of subjects which are intimately connected with digitalis standardization. After a short résumé of the chemistry of the plant, the writers show by references to the papers of Ziegenbein and others that the amount of digitoxin present in several specimens as determined by a chemical examination does not always run parallel with the activity of the specimens as determined by physiologic methods. This fact is of considerable importance, as some manufacturers are putting on the market preparations standardized by the digitoxin method, but as pointed out, even with uniform digitoxin content, there need not be uniform physiologic activity. It is this very fact which renders assay by biologic methods necessary.

That different digitalis preparations of the same name vary greatly in strength is familiar to all physicians who have used the drugs, and by physiologic methods these differences have been shown in both this country and in Europe to be from 100 to 400 per cent.

After discussing the causes of these differences in strength, the authors take up, from the historical standpoint, the subject of the physiologic testing of members of the digitalis series. They give a complete history of the development of this movement from the earliest writings on the subject down to the present time. In 1865 Fagge and Stevenson, in an address before the Royal Society, recommended the frog as a suitable animal on which the various digitalins might be tested in order to determine their relative activity. It is interesting to note that the method they used was essentially the same as is employed to-day by some manufacturers in the assay of their preparations. From the time of the appearance of Fagge and Stevenson's paper in 1866 until the late nineties, a period of thirty years, many papers were published dealing with the question of digitalis variation. A number of different experimental animals were employed, mainly frogs, dogs, and rabbits, and various standards were taken as indicating their relative activity. It seems strange that during this time no practical application was made of the work. It was not until 1898 that Jacquet, who had been examining some of the glycosides of digitalis, suggested that as the leaves show

the causes of digitalis variation. The most important factor he considered to be slow drying of the leaves in which a very considerable amount of moisture is left, sufficient to permit certain enzymes present in the leaves to break up the glucosids to a greater or less extent. To avoid this, Focke recommends that the leaves be dried quickly in an oven so as to get rid of all the moisture.

Several other important papers which appeared during these few years are abstracted in the Bulletin, giving in this way a complete history of the different methods of assay which have been employed up to the present time.

The second part of the bulletin takes up the examination into the accuracy of the various methods which are in vogue to-day for the standardization of members of the series. All of these methods with their different modifications are grouped into three classes. Preparations may be compared (1) by ascertaining the minimum fatal dose on animals; (2) by a comparison of their relative activity on the frog's heart, and (3) by their relative effects on the blood pressure of the higher animals. In all, eight methods of assay were employed illustrating these different groups. The specimens of digitalis, twelve in all, which were assayed by these different methods, were obtained in the open market and were selected as furnishing types of preparations, some of which were made

at times, and the necessity of using several animals for one preparation on account of marked variations which appear. The writers conclude that of all the methods those in which frogs are used, are probably the best, as these animals can always be easily obtained, and in them the drug exhibits its true cardiac effect. They believe that either the method in which the minimum lethal dose is determined or that in which the heart is brought to systolic standstill in one hour should be chosen. They point out that physiologic standardization is not infallible, but that most of the discrepancies are due to the fact that actions on entirely different physiologic functions have been taken as standards instead of an action on the circulation.

The final section of the bulletin and that part which will perhaps interest the practicing physician most, is concerned with the report on the various preparations of digitalis which were examined. To permit a comparison, these were all figured to uniform tincture or 10 per cent. strength. The simplest way to indicate the relative activity of the different preparations is to reproduce a table from the bulletin. A table was therefore prepared by adding together the rankings of each preparation as determined by each method of assay, and then dividing the sum by the number of assays. The lowest numbers would therefore indicate the highest values.

PREPARATION	SUM OF RATING	NUMBER OF ASSAYS	FINAL STANDING
H. K. Mulford & Co., "Digitol".....	15	7	2.14
Burroughs, Wellcome & Co., "Concentrated Tincture".....	16	7	2.28
Nelson, Baker & Co., "Fluid Extract".....	25	7	3.57
Hance Brothers & White, "Fluid Extract".....	29	7	4.14
Parke, Davis & Co., "Fluid Extract".....	31	7	4.43
Wm. S. Merrell Chem. Co., "Normal Tincture".....	40	7	5.71
Sharp & Dohme, "Fluid Extract".....	42	7	6.00
Lloyd Brothers, "Specific Medicine".....	58	7	8.28
Parke, Davis & Co., "Digitalone" Specimen 3.....	34	4	8.50
Parke, Davis & Co., "Digitalone" Specimen 1, 2.....			

according to the United States Pharmacopeial directions, while others might be classed together as non-pharmacopeial or as proprietary preparations. Before discussing the results of the examination of these specimens, it will be interesting to note the writers' conclusions as to the accuracy of the methods now in vogue.

In the first place, no two methods of assay gave the same results—preparations which by one method might appear to be of the same strength, by a second method were shown to differ 100 per cent. A superficial comparison of all the tables seemed to demonstrate the apparent worthlessness of physiologic assay, but on closer examination the outlook did not appear so hopeless. Two of the preparations, "Digitol" and a "Concentrated" tincture, stood at the head of the list in practically every table. Four U. S. P. fluid extracts were found to be of quite uniform strength by several of the methods, and finally two preparations, Lloyd's "Specific medicine" and "Digitalone" stood at the foot of the list in practically every table, so that there was in general an agreement between the different methods.

It was perhaps surprising that the agreement should be as close as it was. In the first place it would be very surprising if the lethal doses for guinea-pigs and frogs should show exactly the same relation because in the former animals the drug kills by paralyzing the respiration, while in the latter the cause of death is of cardiac origin. One preparation might act strongly on the nervous system and have feeble heart action, while a second might act strongly on the heart, but show little effect on the medulla. For this reason the authors say that the method of standardizing preparations of digitalis by ascertaining their toxicity on the higher animals is incorrect.

Considering the different methods in which the frog's heart is used, the authors recommend that in the choice of a method great care should be taken to allow sufficient time for complete absorption of the drug, because, unless this is done, a weak preparation of easily absorbable constituents would appear stronger than a strong preparation containing constituents that are absorbed with difficulty.

The blood-pressure method in which cats or dogs are used, offers practical difficulties in the way of obtaining these ani-

This table indicates probably very closely the relative strength of the different preparations examined and only a few of them are discussed individually.

Two preparations of Mulford's "Digitol" were examined, and although it is said to be "assayed, tested physiologically" and standardized to contain 0.025 gm. digitoxin in 100 c.c., the two preparations were not of the same strength as determined by the "one-hour frog" method, one being 30 per cent. weaker than the other.

Merrell's "Normal Tincture" was diluted to the same degree as the fluid extracts, but as normal tinctures are said to be made from fresh leaves, it is perhaps hardly fair to this preparation, but even so it compares with them fairly well. The maximum dose recommended is about the same as for fluid extracts (3 minims).

Lloyd's "Specific Medicine, Digitalis," gave very interesting results, especially when compared with the claims made by this firm. It was assayed by seven methods—in one table it appears at the bottom of the list; in four it stands last but one, and in the other two it is third from the bottom. Its comparative weakness is thus very clearly shown when it is compared with U. S. P. fluid extracts, and yet, according to Lloyd Brothers' advertising literature, "Specific Medicines" have about double the effect on the system that is possessed by ordinary (non-proprietary?) fluid extracts. The dose recommended is from $\frac{1}{2}$ to 1 minim every hour, which the writers point out is certainly not less than that of a pharmacopeial fluid extract.

Equally interesting were the results obtained with Parke, Davis & Co.'s "Digitalone," three bottles of which were examined. Two of the specimens were dark brown and contained a heavy precipitate and a somewhat sour odor. The other bottle contained a clear light yellow fluid in which was a flaky precipitate. This latter bottle showed a digitalis action, but this was very feeble as compared with any other digitalis preparation examined excepting Lloyd's preparation discussed above. In fact, it is interesting to note that in six of the seven tables the "Specific Medicine" and one or the other "Digitalone" preparations compete for the last place. It was perfectly evident from the appearance of the specimens of

Digitalone that two of them had deteriorated and by the frog's heart method they were shown to be practically devoid of digitalis action. By some of the lethal dose methods they caused death when given in very large doses, but it was a question whether death resulted from the digitalis itself or from digitalis decomposition products. Specimen No. 2 when injected into the circulation of cats raised the blood pressure in two animals 55 per cent., which result the writers suggest may have been due to decomposition products of digitalis acting on the medulla, since the true cardiac action of the drug had been shown to be absent by tests on frogs. Specimen No. 1 when similarly injected showed an action on the blood pressure comparable to the nitrite series, for instead of raising the pressure it lowered it 23 per cent.

While showing the worthlessness of these preparations, the authors point out that although "Digitalone" is claimed to be an aseptic, non-alcoholic permanent solution of digitalis of the same strength as the U. S. P. tincture, it certainly is not permanent under all conditions. One preparation which evidently had not decomposed, at least completely, was about half the strength of a U. S. P. tincture, while the other preparations not only possessed no digitalis action, but were positively harmful.

Correspondence

Necrosis of the Liver After Chloroform Anesthesia

To the Editor:—May I be permitted to comment on the conclusions reached by Drs. John R. Williams and W. D. Becker in their report of a case of "Necrosis of the Liver After Chloroform Anesthesia," THE JOURNAL for May 8, 1909, page 1488? Under title, "Postoperative History," a typical picture of the second stage of acute yellow atrophy of the liver is drawn. These second stage symptoms became rapidly deepened on the third day after operation and chloroform anesthesia, ending in death forty hours after the first indication of any mental disturbance.

The history of the case points very clearly to a severe bacterial infection before the operation. We are shown a patient "subject to attacks of indigestion from childhood." Turbid, dark-brown urine, of acid reaction, and showing albumin blood cells and hyalin casts found postmortem can be assumed to have been present four days before death at the time when the "slight yellow tinge to the sclera" was observed, together with the increasing jaundice "rather noticeable" at the time of death. The acidity of this postmortem urine certainly indicates acid intoxication, and it is a pity that no record of any examination of the urine before the operation appears in the report.

F. W. White designates as one of the special poisonous substances, damaging the function of the liver and thereby producing acute yellow atrophy, "certain products of decomposition in the bowel." Such products of decomposition are very likely to have been present in the case reported even before the attack on April 16 of vomiting and diarrhea, pain, tenderness and no elevation of temperature. Adding to this an expectant treatment of four days, evidences in the urine of acid intoxication and destructive protein metabolism not excluded; at the time of the operation the presence of a slight yellow tinge to the sclera; the finding of an abscess thoroughly walled off containing about eight ounces of foul-smelling pus, up to which event the formation of gastrointestinal toxins could go on undisturbed; the temporary general improvement following evacuation and drainage of the abscess, but the steady increase of jaundice; add finally the third stage symptoms of forty hours' duration, death and the postmortem findings, and we do not have to adduce the toxic action of chloroform used as an anesthetic "in the absence of other explanation" to account for the acute yellow atrophy and its typical pathology.

At the time of the operation there was a slight yellow tinge to the sclera, the patient died in less than four days from yellow atrophy of the liver. In a majority of cases death ensues before the fourteenth day. Almost one-half of the

cases terminate fatally in from the fifth to the tenth day, says A. O. J. Kelly in "Modern Medicine," vol. v. Did or did not chloroform used as an anesthetic cause the death of the patient in question? I think it did not.

I am not as yet prepared to advocate chloroform as a safe anesthetic in cases in which gastrointestinal decomposition products are to be suspected and where functional disorders of the liver is evidenced by even slight jaundice in the absence of gross gall duct obstruction.

In order to prove that chloroform in measured doses given to physiologic effect produces acute yellow atrophy of the liver it will be necessary to collect cases in which the dosage has been accurate and the exclusion of pre-existing atrophy has been positive. Postulates such as those of Drs. Williams and Becker from premises so contradictory are not satisfactory evidence of the danger of chloroform as an anesthetic and should be promptly denied.

CARL R. KRONE, M.D., Oakland, Calif.

Dr. Krone's letter was submitted to Drs. Williams and Becker for comment, and they replied as follows:

To the Editor:—Dr. Krone's criticism of our report is of interest because it suggests the widely different conclusions which careful students may arrive at from a given set of data. He states:

In order to prove that chloroform in measured doses given to physiologic effect produces acute yellow atrophy of the liver, it will be necessary to collect cases in which the dosage has been accurate and the exclusion of pre-existing atrophy has been positive.

It may be inferred from this that Dr. Krone believes it is not proven that chloroform has ever produced liver necrosis, but it seems to us that it has been too generally conceded and too well established to make this a point in a controversy. Moreover, the amount of chloroform administered apparently has little to do with the necrosis which may follow, for a study of the many cases reported in the literature supports this view. In this case, the chloroform was accurately measured, and as was indicated in the report, approximately 4 drams were used. Dr. Krone believes that the liver condition was due to a pre-existing bacterial intestinal intoxication rather than to the toxic effects of the chloroform, and supports his contention mainly on the rather slender evidence presented in the urine examination.

A summary of the facts is as follows: The patient had an old inflammatory condition of the appendix, evidenced both by the history and the anatomic findings. During the attack for which he was operated on he suffered from pain in the abdomen, vomiting and diarrhea. A very slight jaundice was present. The postoperative history was uneventful until the third day, when the patient became irrational and later maniacal. Then followed convulsions, coma, and death.

The history of this case until the third day after operation is clearly one of appendiceal disorder. There was absolutely nothing about it up to this time to suggest either liver disease or intestinal intoxication. The urine examinations made at the time of operation and immediately following it were practically normal. The urine examination referred to by Dr. Krone was made by Dr. Williams from the excretion taken from the bladder at the postmortem. It was entirely different from those previously made, indicating the development of another pathologic state. It is invading the realm of the speculative to conclude from this single examination that the patient was suffering from bacterial poisoning and it is not in accord either with the history of the case or with the material evidence of the postmortem. Histologic examination of the liver sections also pointed strongly toward chloroform necrosis rather than "idiopathic" acute yellow atrophy. It must be conceded that cases of this sort are not capable of demonstration as is a mathematical proposition, nevertheless, we believe the history and findings warrant the conclusion as to cause of death. Intestinal toxemia does not adequately explain it. Furthermore, we are persuaded that chloroform as an anesthetic is more dangerous than is generally appreciated, for since the study of this case two others of similar type and followed by death, have come to our notice in this community.

JOHN R. WILLIAMS.

Book Notices

TEXT-BOOK OF OPERATIVE SURGERY. By Warren Stone Bickham, M.D., Phar. M., Junior Surgeon, Touro Hospital, New Orleans. Cloth. Pp. 1206, with Illustrations. Third edition. Price, \$6.50. Philadelphia: W. B. Saunders Co., 1908.

The text of this edition of Bickham's book has been enlarged by nearly a third, and the illustrations by over half. We are glad to note that some of the omissions and mistakes indicated in the previous review have been corrected.

Bickham still speaks of the advisability of flooding the field of operation to prevent air embolism after injury of the large veins at the base of the neck. He neglects to mention provisional ligation, a plan followed by Fenger with such success. Temporary ligation—merely closing the vein—would prevent the possibility. Flooding the field of operation in such cases is more theoretical than practical. The excision of a synovial sheath of an extensor tendon is still illustrated at a point in the hand where no sheath exists.

The most striking thing in the book is the detail with which the surgical anatomy and the steps of the different operations are given. There is considerable doubt as to the necessity of such detail. It is the application of didactic work to surgical procedures. Naturally, the outlines given can be followed but rarely.

The technic is well described, but the statement made in regard to the second edition that no rules are given to aid an inexperienced operator to make a selection of the procedure to be used holds true for the present edition.

The enormous task of collating and arranging the steps of the different procedures has been well and conscientiously done, and the book will be exceedingly useful for reference.

A TEXT-BOOK OF GENERAL PATHOLOGY. By J. Martin Beattie, M.A. (N. Z.), M.D. (Edin.), Professor of Pathology and Bacteriology, University of Sheffield, and W. E. Carnegie Dickson, M.D., B.Sc., F.R.C.P., Lecturer on Pathological Bacteriology, and Senior Assistant to the Professor of Pathology in the University of Edinburgh. Cloth. Pp. 475, with Illustrations. Price, \$5. Philadelphia: P. Blakiston's Son & Co., 1908.

The pathologist will examine this book with particular interest because of the opening statement of the preface that "the present volume is based on the teaching of the Edinburgh school." Knowing the great influence that has been exercised by this school in British medical thought and practice, he will be interested in learning what it now represents in its teaching and ideals in so fundamental a branch as pathology, and what it may have to offer that is in advance of the ordinary standards. The Edinburgh standards, if the book at hand represents them fairly, call for clear presentation, in a concise way of the most essential facts, without any strong attempt to encourage and to lead students into extensive and independent reading or investigation. Accuracy, care, clearness and honesty of method and purpose are all marked characteristics of this book, but there is no intention of exhaustiveness exhibited, and one gets the impression that the writers have in mind a body of students who have no very strong preparation in the fundamental branches, and who are not to be expected to do anything more than to prepare themselves for the clinical courses. The Edinburgh teaching, therefore, would seem to fall short of the ideals of the very best of the American schools, while probably doing better than is the practice in many of them.

This volume is devoted to the subject of general pathology, a subsequent volume on special pathology being promised. It is reliable, in some places original, as in the discussions of infarct formation and the tissue changes of inflammation, and a good and useful small text-book of general pathology.

It falls short, however, of being an ideal book, according to the highest standards of medical education. The subjects are far too superficially treated to satisfy a thorough, interested student. There is too often the air of one who should say: "These are the main facts, and all you will need to know to pass your examinations; there are many fundamental principles and unsettled theories that you need not bother your head about." Also many subjects are treated in a very incomplete manner. For example, in discussing air embolism, no attempt is made to explain the conditions necessary in or-

der that air may enter the vessels; the mechanism of the effects produced by the intravascular air is not considered; and no mention is made of the possibility of air embolism from obstetric manipulations or from attempted intravenous injection of saline solutions—surely serious omissions in the education of the future practitioner. Similar omissions, not warranted on the ground of economy of space, are by no means infrequent; to mention only one, in the chapter of immunity, the highly important subject of anaphylaxis is not even spoken of.

We criticize this book to this extent because it is worth it. There are many commendable features, and any medical student will find help and profit in its pages—it comes so near being an excellent text that the shortcomings are all the more to be regretted.

One of the best features is the illustrating, which is splendid. There is perhaps no other English text with equally good illustrations from the standpoint of clearness, accuracy, and helpfulness for the student. For reproduction of photographs they are unusually good, being in the main as clear as diagrammatic drawings, with the added virtue of being true reproductions of actual conditions. In order to make these numerous reproductions the publishers have printed the entire book on highly glazed paper, which is exceedingly trying to the eyes and very easily torn. It is also to be presumed that the illustrations account for the price, being rather high for a book of this size.

Miscellany

The Diagnostic Value of the Porges Reaction in Paresis.—C. Tommasi (*Riv. di patol. nerv.*, February, 1909, xiv, No. 2) has tested the Porges glycocholate of soda reaction in 10 paretics, 1 case of suspected syphilis, 1 epileptic, 1 idiot and 6 senile dement, and tabulates and discusses the results. Two series of tests were made with an interval of from a week to a month between them in various cases. In the first series he obtained 3 positive and 7 negative reactions in the paretics and 3 positive and 6 negative in the others. In the second series there were only 10 paretics, 1 having died in the interval; the others gave 3 positive and 6 negative reactions. Of the 9 non-paretics there were also 3 giving positive reactions, but only 1 of these was positive in the first series (in the case of suspected syphilis), a dubious reaction appearing only after fifty hours. One paretic who showed a negative reaction in the first series was one of those who gave a positive reaction in the second series. From these findings, Tommasi concludes as follows: 1. The reaction of Porges with soda glycocholate is not constant in paresis. 2. A positive reaction may occur in individuals free from paresis or syphilitic taint in a proportion of cases nearly or quite equal to that in which it occurs in paretics. 3. The reaction is not always a constant result, either positive or negative in the same individual, paretic or non-paretic.

Medical Genealogy.—The Germans have inaugurated an effort to collect the medical histories of families and preserve them for purposes of research on heredity and similar questions. The *Centralstelle für deutsche Personen- und Familienforschung*, which has its headquarters at Leipsic, Neumarkt 29, has founded a department for collection of biologic and medical data bearing on the medical genealogy of different families. The necessity for such research and collections was emphasized anew by Professor Sommers in his postgraduate course at Giessen last August on "Families and Heredity," especially the necessity for study of the connection between the inherited *Anlage* and the fate of the family, and between the *Anlage* and the environment, as the most effectual means of throwing light on the evolution of the human race. It is the only means to determine the laws regulating the inheritance of chromosomes and the prominence or latency of various properties in the offspring. In an article in the *St. Petersburg. med. Wochenschrift*, May 15, Eichfuss urges systematic research in this line, especially in regard to hemophilia, tabes, tuberculosis, scrofula, carcinoma, syphilis and mental and nervous affections. He says that the field has been

worked a little by the psychiatrists and criminologists, but it will yield a most interesting and instructive harvest in all lines.

To Open the Thorax for Autopsy.—In the *Semana Medica*, April 15, 1909, D. Del Valle gives an illustration to show the advantages of obtaining access to the thorax, after the usual median incision from chin to symphysis, by cutting out the sternum and adjoining costal cartilages, down to and including the fifth. The inner end of the clavicle is first disarticulated. The flap of bone and cartilage thus outlined is separated from the parts beneath and removed, leaving a broad and long opening into the chest, wider below than at the top, while the retention of the sternum and cartilages below the fifth leaves the diaphragm in place intact. This prevents the escape of fluids, while allowing much more instructive oversight of conditions.

Treatment of Neurasthenia.—The Germans have a word, *Ausspannung*, which means to take off the harness and step out of the shafts for a brief interval. In a communication to the *Zeitschrift für Balneologie*, ii, No. 1, Boas advises such periods of relaxation—*Ausspannungen*—as a systematic therapy, he sends the patients away from home for five or ten days at intervals of six or eight weeks, and has been amazed at the resulting benefit in many instances. The neurasthenic conditions resulting from excessive mental work or emotional strain are the ones that benefit by these brief relaxation trips. It is not necessary to go to a health resort; a trip to some other city will answer the purpose in winter where there is opportunity for attending theaters, concerts, museums, etc. The main point is to have these little *Ausspannungen* repeated systematically every six or eight weeks.

The Public Service

Army Changes

Memorandum of changes of stations and duties of medical officers, U. S. Army, for the week ended June 5, 1909:

Coffin, J. M., capt., granted an extension of 18 days to his leave of absence.
Palmer, F. W., capt., relieved from duty at Fort Benjamin Harrison, Ind.; will proceed at the expiration of his present leave of absence to Fort William H. Seward, Alaska, for duty.
Hutton, P. C., capt., when relieved at Fort William H. Seward, Alaska, will proceed to Fort Snelling, Minn., for duty.
Murray, A., capt., relieved from duty at Fort DuPont, Del.; will proceed to Fort Egbert, Alaska, for duty.
Grissinger, J. W., capt., when relieved from duty at Fort Egbert, Alaska, will proceed to Fort Gibbon, Alaska, for duty.
Hall, J. F., capt., when relieved at Fort Gibbon, Alaska, will proceed to Fort Brady, Mich., for duty.
Whaley, A. M., capt., relieved from duty at Fort Sam Houston, Texas, and ordered to Fort St. Michael, Alaska, for duty.
Sweazey, V. E., capt., when relieved from duty at Fort St. Michael, Alaska, will proceed to Plattsburg Barracks, N. Y., for duty.
Miller, E. W., capt., granted an extension of one month to his leave of absence.
Truby, W. F., major, granted an extension of 15 days to his leave of absence.
George, W. R. S., O'Day, S. F., Phillips, H. F., Kearney, R. A., Miner, Donald, 1st lieutenants, M. R. C., ordered to proceed home from their present station.
Tenney, E. S., 1st lieut., M. R. C., granted leave of absence for 1 month, 20 days, about June 7.
Porter, E. H., 1st lieut., M. R. C., ordered from Fort Worden, Wash., to Fort Casey, Wash., for temporary duty.
Magee, J. C., 1st lieut., M. R. C., granted leave of absence for 5 days.
Doerr, C. E., 1st lieut., M. R. C., granted leave of absence for 10 days.
Harmon, D. W., 1st lieut., M. R. C., granted leave of absence for 20 days.
Dear, W. R., 1st lieut., M. R. C., granted leave of absence for 10 days.
Doerr, C. E., Bayly, R. C., Leary, T. J., 1st lieutenants, M. R. C., ordered to Fort D. A. Russell, Wyo., for duty with Company A, H. C. Shields, W. S., Card, D. P., Kerr, R. W., 1st lieutenants, M. R. C., ordered to San Francisco, Cal., for duty with Company B, H. C. Parce, A. D., Wilson, J. A., Goldthwaite, R. H., 1st lieutenants, M. R. C., ordered to Fort Niagara, N. Y., for duty with Company C, H. C.
Burket, J. A., 1st lieut., M. R. C., relieved from duty at Fort Snelling, Minn., and ordered to Fort Riley, Kans., for duty.
King, C. T., 1st lieut., M. R. C., relieved from duty at the Presidio of Monterey, Cal., and ordered to Fort Williams, Me., for duty.
McCornack, C. C., 1st lieut., M. R. C., relieved from duty at Vancouver Barracks, Wash., and ordered to Plattsburg Barracks, N. Y., for duty.
Fisk, O. C., 1st lieut., M. R. C., relieved from duty at Fort Leavenworth, Kans., and ordered to Fort Terry, N. Y., for duty.
Fox, J. S., 1st lieut., M. R. C., relieved from duty at Fort Sam Houston, Texas, and ordered to Fort McKinley, Me., for duty.
Kennedy, J. S., 1st lieut., M. R. C., relieved from duty at Fort Sam Houston, Texas, and ordered to Fort Bliss, Texas, for duty.

Demmer, C. C., 1st lieut., M. R. C., relieved from duty at Fort Ontario, N. Y.; will proceed to Fort Rodman, Mass., for duty.
Chase, C. L., 1st lieut., M. R. C., when relieved from duty at Fort Rodman, Mass., will proceed to Fort Gibbon, Alaska, for duty.
Harmon, D. W., 1st lieut., M. R. C., will proceed to Fort Davis, Alaska, for duty.
Trotter-Tyler, G., 1st lieut., M. R. C., ordered from Fort Adams, R. I., to Fort Strong, Mass., for temporary duty.
Mueller, A., 1st lieut., M. R. C., Magee, J. C., 1st lieut., M. R. C., Heath, G. D., Jr., 1st lieut., M. R. C., ordered to San Francisco, Cal., for duty at the Army General Hospital.
Coburn, H. C., 1st lieut., M. R. C., ordered to Fort Slocum, N. Y., for duty.
Tuttle, A. D., 1st lieut., M. R. C., ordered to San Francisco, Cal., to sail July 5 for the Philippine service.
Wright, F. S., 1st lieut., M. R. C., ordered to New York City on business of the Medical Department, and thence to the Presidio of Monterey, Cal., for duty.
Garcia, L. C., 1st lieut., M. R. C., ordered to Fort McDowell, Cal., for duty.
Snow, C. G., 1st lieut., M. R. C., ordered to Fort Leavenworth, Kans., for duty.
Dear, W. R., 1st lieut., M. R. C., ordered to Fort Sheridan, Ill., for duty.
Frank, C. E., 1st lieut., M. R. C., ordered to Fort Sam Houston, Texas, for duty.
McDiarmid, N. L., 1st lieut., M. R. C., ordered to Fort Sam Houston, Texas, for duty.
Smith, W. H., 1st lieut., M. R. C., ordered to Vancouver Barracks, Wash., for duty.
Stayer, M. C., 1st lieut., M. R. C., ordered to Fort McDowell, Cal., for duty.
Trenholtz, C. A., 1st lieut., M. R. C., ordered to Fort Baker, Cal., for duty.
Waring, J. B. H., 1st lieut., M. R. C., ordered to Fort Lawton, Wash., for duty.
Davis, A. D., 1st lieut., M. R. C., ordered to Fort Lawton, Wash., for duty.
McLellan, George H., 1st lieut., M. R. C., ordered to Fort Crook, Nebr., for duty.
Dunbar, L. R., 1st lieut., M. R. C., ordered to Fort Casey, Wash., for duty.
Trotter-Tyler, G., 1st lieut., M. R. C., relieved from duty at Fort Adams, R. I., will proceed to Vancouver Barracks, Wash., for duty.
Lowe, Thomas S., 1st lieut., M. R. C., relieved from further duty at Fort Walla Walla, Wash., and from temporary duty at Vancouver Barracks, Wash.; will proceed to Fort Lawton, Wash., and report for duty in the Army Transport Service.
George, W. R. S., 1st lieut., M. R. C., honorably discharged from the service of the United States, his services being no longer required.

Navy Changes

Changes in the Medical Corps, U. S. Navy, for the week ended June 5, 1909:

Guest, M. S., surgeon, detached from the *Tennessee* and ordered to the Naval Academy, Annapolis, Md.
Bogert, E. S., Jr., surgeon, detached from the Naval Academy and ordered to the Navy Yard, New York, for temporary duty.
Hoen, W. S., P. A. surgeon, detached from duty at the Naval Hospital, Las Animas, Colo., and ordered to the *Philadelphia*.
Angwin, W. A., P. A. surgeon, detached from the *Philadelphia* and ordered to the *Tennessee*.
Ziegler, J. G., Kerr, W. M., Clark, G. F., Harlan, T., Riker, G. A., asst.-surgeons, commissioned asst.-surgeons, with rank of lieutenants (junior grade), from April 14, 1909.
Jenkins, H. E., Riddick, W. J., acting asst.-surgeons, commissioned acting asst.-surgeons, with rank of lieutenant (junior grade), from May 26, 1909.
Hart, S. D., acting asst.-surgeon, ordered to duty at the Naval Hospital, Navy Yard, New York.

Public Health and Marine-Hospital Service

List of changes of stations and duties of commissioned and other officers of the Public Health and Marine-Hospital Service for the seven days ended June 2, 1909:

Cofer, L. E., asst. surgeon general, directed to proceed to Fortress Monroe and Fisherman's Island, Va., on special temporary duty.
Young, G. B., surgeon, detailed to represent the service at the meeting of the American Medical Association, to be held in Atlantic City, N. J., June 7-11, 1909.
Grubbs, S. B., P. A. surgeon, directed to proceed to La Guaira, Venezuela, on special temporary duty.
Goldberger, Joseph, P. A. surgeon, directed to proceed to Woods Hole, Mass., on or about June 25, 1909, on special temporary duty.
Wilson, R. L., P. A. surgeon, granted 15 days' leave of absence from June 2, 1909.
Stiles, Charles W., chief, division of zoology, Hygienic Laboratory, detailed to attend the fifty-sixth annual meeting of the Medical Society of North Carolina in Asheville, N. C., June 15, 1909.
Adams, F. B., acting asst.-surgeon, granted 21 days' leave of absence from June 1, 1909.
MacCaffry, W. B., acting asst.-surgeon, granted 4 days' leave of absence in May, 1909, under paragraph 210, Service Regulations.
Stuart, A. P., acting asst.-surgeon, granted 30 days' leave of absence from June 30, 1909.
Wright, F. T., acting asst.-surgeon, granted 30 days' leave of absence, without pay, from May 23, 1909.
Hunt, Reid, chief, division of pharmacology, Hygienic Laboratory, detailed to attend the annual session of the American Medical Association (Section on Pharmacology and Therapeutics) to be held in Atlantic City, N. J., June 8-11, 1909.

BOARD CONVENED

Board of medical officers convened to meet at the Marine Hospital office, Seattle, Wash., May 29, 1909, for the purpose of examining alien Yutaka. Detail for the board: P. A. Surgeon M. W. Glover, chairman; Asst.-Surgeon C. W. Chaplin, recorder.

Health Reports

The following cases of smallpox, yellow fever, cholera and plague have been reported to the Surgeon General, Public Health and Marine Hospital Service, during the week ended June 4, 1909.

SMALLPOX—UNITED STATES

Arizona: Winslow, April 24-May 1, 1 case, 1 death
California: Los Angeles, May 8-15, 3 cases; San Francisco, 1 case.
District of Columbia: Washington, May 15-22, 1 case
Georgia: Atlanta, Jan 15-May 21, 62 cases; Macon, May 2-9, 3 cases
Illinois: Danville, May 16-23, 2 cases; Springfield, May 11-21, 1 case
Kentucky: Covington, May 15-22, 3 cases; Newport, 1 case
Massachusetts: Somerville, May 15-22, 1 case
Minnesota: Duluth, May 13-20, 2 cases
Missouri: Kansas City, May 15-22, 2 cases
Montana: Butte, May 6-20, 11 cases
New Jersey: New Brunswick, May 1-22, 5 cases
North Carolina: State of, April 1-30, 127 cases
Ohio: Columbus, May 15-22, 1 case; Sandusky, May 5-15, 1 case
Pennsylvania: Philadelphia, May 11-21, 1 case; Pittsburgh, May 15-22, 1 case
Utah: State of, April 1-30, 37 cases
Virginia: Portsmouth, May 15-25, 2 cases, 2 deaths
Washington: Spokane, May 1-5, 5 cases
Wisconsin: Milwaukee, May 15-22, 2 cases

SMALLPOX—INSULAR

Philippine Islands: Manila, April 10-17, 9 cases, 2 deaths

SMALLPOX—FOREIGN

Africa: East London, April 10-17, 1 case, 1 death
Algeria: Algiers, April 1-30, 18 cases, imported
Brazil: Rio de Janeiro, March 29-April 25, 44 cases, 26 deaths;
Sao Paulo, April 5-11, 1 death
Canada: Halifax, May 8-15, 2 cases; Toronto, April 24-May 15, 5 cases; Yarmouth, May 22-29, 2 cases
Ceylon: Colombo, March 27-April 17, 5 cases, 4 deaths
China: Amoy, April 20 present
Egypt: Cairo, April 8-29, 22 cases, 19 deaths
India: Bombay, April 20-27, 20 deaths; Calcutta, April 10-17, 171 deaths; Madras, April 17-23, 2 deaths; Rangoon, April 10-17, 9 deaths
Indo China: Saigon, April 3-10, 2 cases, 2 deaths
Italy: Catania, May 1-8, 1 case; Naples, May 2-16, 17 cases, 7 deaths
Java: Batavia, April 10-17, 3 cases
Mexico: Matamoros, May 8-15, 1 case; Monterey, May 9-16, 10 deaths; Veracruz, 1 case
Portugal: Lisbon, May 8-15, 4 cases
Russia: Odessa, April 24-May 1, 1 case, 1 death; St. Petersburg, April 10-17, 13 cases, 5 deaths; Warsaw, March 6-20, 6 deaths
Serbia: Belgrade, May 1-8, 10 cases, 2 deaths
Spain: Barcelona, May 3-10, 5 cases; Madrid, April 1-30, 30 deaths; Vigo, May 1-8, 1 death

YELLOW FEVER

Barbados: May 8-15, 1 case
Brazil: Para, May 1-8, 4 cases, 2 deaths
Mexico: Merida, May 14, 1 case, imported from Tehax

CHOLERA—INSULAR

Philippine Islands: Provinces, April 10-17, 133 cases, 90 deaths

CHOLERA

India: Bombay, April 20-27, 25 deaths; Calcutta, April 10-17, 108 cases; Rangoon, 5 deaths
Russia: St. Petersburg, May 7-14, 15 cases, 7 deaths

PLAGUE

Brazil: Rio de Janeiro, March 27-April 25, 3 cases
Chile: Antofagasta, April 17, 9 cases; Iquique, April 18, 22 cases
Egypt: General, April 16, 29 cases, 19 deaths
German East Africa: Muanza, April 14, 60 deaths
India: General, April 10-17, 5,309 cases, 4,594 deaths; Bombay, April 20-27, 508 deaths; Calcutta, April 10-17, 90 deaths, Rangoon, 30 deaths
Indo China: Saigon, April 3-10, 5 cases, 5 deaths
Japan: Himeji, April 30, 1 case, 1 death; Kobe, April 17-24, 2 cases, 2 deaths; Yokohama, April 24-May 1, 1 case
Peru: Lima, April 24-May 1, 10 cases, 6 deaths
Straits Settlements: Singapore, April 3-10, 2 deaths

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS will not be noticed. Queries for this column must be accompanied by the writer's name and address, but the request of the writer not to publish name or address will be faithfully observed.

LENHARTZ DIET.

To the Editor.—Will you kindly state what constitutes the so-called Lenhartz diet, which is used in ulcer of the stomach?
G. N. P. Vonkers, N. Y.

ANSWER.—The Lenhartz diet was described in THE JOURNAL, Jan 20, 1907, and again May 30, 1908, p. 1813. It consists of a some what abundant diet, chiefly of proteids, given on the principle that the excess of acid is thereby neutralized and the healing of the ulcer facilitated. The patient is put to bed and absolute rest enjoined so that the first two weeks following hematemesis the feces and urine are passed in a bedpan. Mental quietude is also enjoined,

especially freedom from any form of excitement. Confinement to bed is continued for at least four weeks. An ice bag is laid over the region of the stomach to promote the contraction of that organ, lessen the exposed surface of the ulcer and relieve pain. On the first day, even after hematemesis, the patient receives in teaspoonful doses about a pint of lead milk and one, two or three fresh beaten eggs during the first twenty-four hours. The eggs are beaten up with a little sugar and the cup containing them placed in a dish filled with ice, so that they remain cold. In addition two or three times a day or oftener, bismuth subnitrate in, at most, 30 grain doses, is given, suspended in water, and these doses are repeated, as needed for the first ten days, two or three times a day. The amount of milk is increased daily by about 100 c.c. (3½ oz.) and daily one egg is added until at the end of the first week about 800 c.c. (26½ oz.) of milk and from six to eight eggs are taken daily. After six days scraped beef can be given in quantities increased from the beginning dose of 31 gm. (1 oz.) to 70 gm. (2½ oz.) the second day, and so on, the beef being stirred into the egg. Gruel, softened zwieback, etc., may be added to the diet after two weeks, and at the end of four weeks an abundant mixed diet, avoiding coarse vegetables and other irritating substances, can be given. The bowels are kept open by enemata.

The method is described by M. Wagner (*Munch med Wchnschr*, Jan 5, 1903) and also by J. V. Haberman (*Medical Record*, June 16, 1906). This method was tested by E. Wirsing (*Archiv f. Verdauungskrankheiten* xl, 3), in comparison with the method of Leube, and he reaches the conclusion that it is better than the older method for patients who have had recent hemorrhages or who are much debilitated but that the method of Leube should be given the preference in ordinary cases. Wirsing's article was reviewed in THE JOURNAL, Oct 7, 1905, page 1122.

This form of treatment has been tested by Lambert in eight cases of a severe type (*Am. Jour. Med. Sci.*, January, 1908, abstracted in THE JOURNAL, Feb 8, 1908, p. 480), and he comes to the conclusion that the claims of Lenhartz are correct; that the cure is equally efficient with the older method, is more rapid and more certain, vomiting stopping more quickly and relapse occurring less frequently than in the Leube method; that pain ceases more promptly, a sufficient food supply is afforded, anemia can be treated earlier and a return to full diet allowed sooner than in the older method.

Lambert's modifications are more fully described in THE JOURNAL, Aug 8, 1908, p. 497. If the patient prefers he allows a mixing of the eggs and milk and feeding the mixture, instead of the usual alternation as advised by Lenhartz. He also substitutes chopped chicken for the raw ham in the treatment of Lenhartz. After the tenth day Lambert allows a broiled chop, beefsteak or chicken as a substitute for the raw beef. Later ice cream is added and zwieback is changed to toasted bread, and other cereals take the place of rice.

ETIOLOGY OF SCARLET FEVER

To the Editor.—Please give me references to the latest findings or research in regard to the etiology of scarlet fever.
E. B. FURCHOLSEN, M.D., Trenton, N. J.

ANSWER.—Among the more important recent articles embodying the results of investigations into the etiology of scarlet fever may be mentioned especially the following:

Hektoen, L. Bacteriologic Examination of the Blood During Life in Scarlet Fever with Special Reference to Streptococci, *THE JOURNAL A. M. A.*, 1903, xl, 685.

Weaver, George H. Bacteriologic Studies of the Skin and Throat in Cases of Scarlatina, *Tr. Chicago Path. Soc.*, 1903, v, 222; *Tr. of St. Antococci*, Especially those cultivated from Throats of Bacteria from the Throats of Scarlet Fever Patients, with special reference to Streptococci, *Jour. Med. Research*, 1903, iv, 246.

Mallory, F. B. Scarlet Fever: Protozoan-like Bodies Found in Four Cases, *Jour. Med. Research*, 1904, x, 483.

Jochmann, G. Die Bakterienbefunde bei Scharlach und ihre Bedeutung für den Krankheitsprozess, *Ztschr. f. klin. Med.*, 1905, lvi, 316.

Duval, Die Protozoen des Scharlachfiebers, *Vuchow's Arch. f. path. Anat.*, 1905, cixxiv, 485.

Field, C. W. The Presence of Certain Bodies in the Skin and Blister Fluid from Scarlet Fever and Measles, *Jour. Exper. Med.*, 1905, vii, 343.

Ruediger, G. F. The Streptococci from Scarlatina and Normal Throats, *Jour. Infect. Dis.*, 1906, iii, 755.

Gabritschewsky, Ueber Streptokokkennaccine und deren Verwendung bei der Diase der Pferde und dem Scharlach des Menschen, *Centralbl. f. Bakteriol.*, part 1, Orig. 1906, xli, 719, 844.

Tunnicliffe, R. M. The Streptococcus opsonic Index in Scarlet Fever, *Jour. Infect. Dis.*, 1907, iv, 304.

Hektoen, L. Is Scarlet Fever a Streptococcus Disease? *THE JOURNAL A. M. A.*, 1907, xlviii, 1158.

Gabritschewsky, Ueber Streptokokkennervthe und ihre Beziehungen zum Scharlach, *Berl. klin. Wchnschr.*, 1907, xlv, 556.

Gamalein, N. T.: Scharlachreger. *Berl. klin. Wchnschr.*, 1908, xiv, 1795.

Williams, A. W.: Recent Studies on Scarlet Fever, *Am. Jour. Obst.*, 1908, lviii, 152.

Schleissner, F.: Bakteriologische und serologische Untersuchungen bei Scharlach, *Wien. klin. Wchnschr.*, 1909, xxii, 553.

HAIR-PIN IN THE FEMALE BLADDER

To the Editor: The report of T. L. Hazard in THE JOURNAL, May 29, page 1759, on the case of a "Hair-Pin in the Male Urethra," prompts me to forward the following: The patient, who was referred to me by Dr. Shaw, of Junction City, Ohio, was a young, robust girl; she stated that while dressing, a hair-pin fell from her hair striking a nearby sofa, from which it rebounded into her bladder (unique explanation!). The hair-pin could be seen through the cystoscope, the loop of the pin pointing toward left wall of bladder. The accident (?) having occurred so recently, there was no incrustation and the pin was easily removed by hooking it out of the bladder with the little finger of my left hand, introduced after full dilatation of the urethra under general anesthesia.

STARLING S. WILCOX, M.D., Columbus, Ohio.

BILLROTH'S ANESTHESIA SOLUTION

To the Editor:—Your explanation of the A. C. E. mixture in THE JOURNAL, May 29, page 1775, was incorrect. The mixture was also called the 1, 2, 3 mixture:—1 part alcohol, 2 parts chloroform, 3 parts ether.

W. E. SHAW, Cincinnati.

ANSWER: The ordinary A. C. E. mixture, so called because it is a mixture of alcohol, chloroform and ether, contains 1 part of alcohol, 2 parts of chloroform, and 3 parts of ether, as our correspondent states. The query which was answered in THE JOURNAL, May 29, referred to Billroth's anesthetic mixture, which is also an A. C. E. mixture, composed of 1 part of alcohol, 3 parts of chloroform and 1 part of ether.

MARTIN STAIN FOR TUBERCLE BACILLI

To the Editor:—Please publish in detail mode of making stains for use in the Martin-Herman Mons method of staining tubercle bacilli.

A. R. SMITH, Los Angeles.

ANSWER: The Martin stain consists of two liquids: 1, A mordant solution consisting of a 1 per cent. solution of ammonium carbonate; 2, a stain made by dissolving 3 per cent. of crystal violet (methyl violet, 6 B.) in 95 per cent. ethyl alcohol. These solutions should be kept separately and mixed when wanted for use in the proportion of 3 parts of the mordant to one of the stain. After staining, the specimen is decolorized with 10 per cent. nitric acid in 5 per cent. ethyl alcohol. Crystal violet can be obtained by dealers in bacteriologic supplies.

DELAYED HEALING OF WOUNDS

To the Editor:—What is the reason that in some persons the healing process in cuts, abrasions, etc., is so slow? Take, for instance, the case of a man of 35, in apparent good health, who knocked off a piece of skin from the hand, one-quarter of an inch square. There was at first profuse bleeding and then an oozing of serum for from twenty-four to thirty-six hours. A crust then formed, but on motion the parts cracked, showing a seropurulent fluid beneath. After a week healing commenced and continued. The final stage was a hard corn-like scab which had to be cut like a corn and worn thin, having a smooth scar for a long time. The total time from inception to scar in the individual is from three to four weeks for even the smallest injury. Would vaccine therapy offer any hope of cure and what would be likely to help?

E. W. BURR, Westport, Mass.

ANSWER:—The explanation lies without doubt in two factors: a lack of resisting power on the part of the general system and some local condition in the skin unfavorable to healing. The latter condition may arise from a constitutional peculiarity of the individual's skin or from irritation in consequence of poisons circulating in the blood or, lastly, from repeated local infection. Theoretically, vaccine therapy ought to re-enforce the deficient immunizing action of the blood and favor healing. The vaccine would most appropriately be made from the secretions of the unhealed wound.

McCormack in Missouri

Dr. McCormack has terminated a month of remarkably successful meetings in Missouri, having given his entire time during May to this work. The press notices received show unusual interest, while the attendance at practically all of the meetings was large and enthusiastic. Extracts from a few of the newspaper comments follow:

The Maryville *Tribune*, besides giving an extended account of the lecture, said editorially: "Monday was a great day for the physicians of Maryville and those who heard Dr. McCormack speak. Startling truths, clothed in chaste words and phraseology, sent fathers and mothers home to think about these evils of society which are best judged from the physician's standpoint. The one great proof of the facts which he uttered was the spirit of unselfishness in which advice was given, in which he showed what the medical profession has, can and will do for the human race. . . . Dr. McCormack's visit to Maryville did good which can never be estimated. It set people to thinking, and in doing so accomplished that to which many men in carrying on a work fail to attain."

The Maryville *Republican* says: "One good result coming from the meeting was the referring of the matter of appointing a committee to investigate the public health conditions of Maryville to the mayor and city council. The council was requested to appoint a committee to investigate the probable sources of menace to the health of the city. . . . Probably not in years has such an address caused so much thinking on

the part of the people of Mayville. Startling statements proving the great and common disregard for health surprised the big audience."

The *Chillicothe Constitution* says editorially: "The business of the physician has reached a higher level than that of merely doctoring symptoms and alleviating pain. . . . The studious, honest physician has progressed beyond this stage. He is not only a healer, but an educator. He looks over and beyond the dollar and exercises the part of a humanitarian and takes to himself the burden of being to a certain extent his brother's keeper. It is much better that disease should be prevented than that it should be cured. It is much more beneficial to the people of America that they know how to observe the laws of health and sanitation and that they preserve their bodies from contagion and infection than that new methods of curing illness should be discovered. The Chillicothe physicians are to be congratulated on having secured the services of Dr. McCormack as a lecturer here, and on the broad spirit of progressiveness that leads them to take part in such a movement as Dr. McCormack represents." The *Constitution* also says editorially, in a later issue, under the title "Needed Health Reforms:" "The criticisms leveled against the country at large, the state of Missouri and the Missouri municipalities regarding their neglect of the public health, uttered by Dr. J. N. McCormack of the American Medical Association in Chillicothe recently, were not only timely, but were amply justified." The editorial then comments on the need of a vital statistics law in Missouri and urges the adoption of such a statute. It is gratifying to note that in the last few weeks a thoroughly satisfactory vital statistics law has been adopted in Missouri, due largely to the efforts of the organized medical profession of the state.

At Kirksville, Mo., the local press gave lengthy notices of the meetings, both before and after, and said: "Dr. McCormack is a forceful speaker and held his audience in the closest attention with his presentation of naked truths and facts that made the average man and woman think that perhaps this manner of physical life could be improved on." Editorially, the *Daily Express* says: "Dr. McCormack's recent lecture has stirred things up in this old town. The lectures served as an eye opener on some things."

The *Hannibal Morning Journal* says: "Dr. McCormack is delivering these timely health talks in cities all over the country and is doing a great deal of good. . . . Last night a magnificent audience, composed of representative citizens of this community, assembled at the high school auditorium to listen to a masterly address. Dr. McCormack is a splendid speaker, and held the undivided attention of the audience from the beginning to the close of his remarks."

The *Sedalia Democrat-Sentinel* says: "Dr. McCormack's talk was interesting because he spoke the truth, because he spoke entertainingly and convincingly, giving facts and figures to prove his arguments, because he struck out fearlessly, exposing sins of omission and commission, hitting a head wherever he saw it, then pouring the oil of kindness and humanity on the wound he was compelled to make. His object in making these exposures was not merely to criticize, but primarily to bring the facts before his audience so that they could think of and correct them. . . . He held the entire attention of his audience for over two hours."

The above are only a few extracts from a large number of newspaper reports received. The work being done in Missouri is of great value and will produce results of undoubted benefit to the public.

Unqualified Practitioners in England

The interest taken by the medical profession of Great Britain in the question of the practice of medicine by unqualified persons was commented on at length in a previous number of THE JOURNAL. That this interest is sustained and is taking the direction of practical investigation is shown by the circular recently issued to medical officers of health by the local government board, calling attention to the resolutions adopted by the General Medical Council of the British Medical Association, and stating that before taking any steps in the matter the lord-president of the local government board wishes to

obtain definite information regarding the extent to which medical practice is carried on by unqualified persons. Local health officers are therefore asked to report whether the practice of medicine and surgery by unqualified persons is increasing and whether the health of the public in the district is affected thereby. The collection of data along this line will undoubtedly furnish much interesting and valuable information.

Marriages

HENRY ANTHONY STRECKER, M.D., to Miss Nellie Marie Carroll, both of Philadelphia, Pa., June 2.

FRANK G. CROWELL, M.D., to Miss Nettie Cratty, both of Rochelle, Ill., May 19.

ROBERT L. BONE, M.D., Madisonville, Ky., to Miss Ade'e Lewis, at Baltimore, May 28.

ELIOT BISHOP, M.D., Brooklyn, N. Y., to Miss Pearl Rogers of Wilkes-Barre, Pa., June 1.

HARRY J. WILLEY, M.D., Lawrence, Kan., to Miss Mabel Green of Thayer, Kan., May 18.

EDWARD MEYER, M.D., New York City, to Miss Margaret E. McLaurine, at Baltimore, May 21.

EDGAR H. LITTLE, M.D., to Miss Gertrude Cline, both of East St. Louis, Ill., at Vandalia, Ill., May 24.

EDWARD MITCHELL VAUGHAN, M.D., to Miss Marie Hepburn Nowland, both of Middletown, Del., June 1.

G. MEMORY CHAPMAN, M.D., Logan's Store, N. C., to Miss Annie B. Ford of Hickory, N. C., May 19.

WILLIAM McCULLY JAMES, M.D., Ancon, Panama, to Miss Mary Gurley McCulloch, at Ancon, May 1.

SAMUEL J. SMART, M.D., Logansport, La., to Miss Cora Wallace of Centennial, Texas, at Shreveport, La., May 23.

PERRY C. BENTLE, M.D., Greensburg, Ind., to Miss Pearl Booth of Rush county, Ind., at Rushville, Ind., May 28.

Deaths

Henry Chrysostom Keenan, M.D. College of Physicians and Surgeons, New York City, 1895; a member of the Medical Society of the State of New York; president of the Brooklyn Gynecological Society; associate gynecologist to St. Mary's General Hospital, and gynecologist to St. Mary's Maternity Hospital; a police surgeon of Brooklyn for ten years; died in the Cumberland Street Hospital, Brooklyn, June 1, as the result of injuries received in a runaway accident received an hour before, aged 36.

Philo D. St. John, M.D. College of Physicians and Surgeons, New York City, 1883; formerly surgeon to the Rock Island System at Wichita, Kan.; a member of the Kansas State Board of Health in 1896 and 1897; from 1892 to 1896 city physician of Wichita; and a member of the staff of the Wichita and St. Francis hospitals; died at his home in Wichita, May 23, from accidental poisoning by carbolic acid, aged 57.

John T. Binkley, M.D. Pennsylvania Medical College, Philadelphia, 1852; of Evansville, Ind.; for many years a member of the American Medical Association; sometime professor of physiology in the Hospital College of Medicine, Evansville; was found dead in the Wellington Hotel, Chicago, June 2, aged 82, from the effects of a gunshot wound of the skull, believed to have been inflicted by a thief.

John Alexander Geisendorffen, M.D. Marion-Sims Medical College, St. Louis, 1891; Jefferson Medical College, Philadelphia, 1893; a member of the American Medical Association and Pacific Coast Association of Railway Surgeons; local surgeon to the Oregon Railway and Navigation Company at The Dalles, Ore.; died in St. Vincent's Hospital, Portland, Ore., May 26, from meningitis, aged 43.

Martin Henry Luken, M.D. Rush Medical College, Chicago, 1873; a member of the American Medical Association, Chicago Pathological Society and German Medical Society; for many years attending gynecologist to St. Elizabeth's Hospital and a member of the staff of the Norwegian Lutheran Tabitha Hospital, Chicago; died at the home of his brother in Chicago, June 5, aged 58.

Arthur M. Thome, M.D. Rush Medical College, Chicago, 1851; assistant surgeon in the Army during the Civil War, and later superintendent of the U. S. Marine Hospital, Keokuk, and professor of anatomy in Keokuk Academy; a minister in the Congregational church since 1866; died at his home in Chicago, May 28, aged 86.

Elizabeth D. Kane, M.D. Woman's Medical College of Pennsylvania, Philadelphia, 1883; a member of the American Medical Association; who confined her practice to the poor at her home in Kane, Pa.; prominent in educational, temperance and philanthropic affairs; died at her home in Kane, May 25, aged 73.

Floriman James Taylor, M.D. Rush Medical College, Chicago, 1881; of Pittsfield, Maine; a member of the Maine Medical Association, and secretary of the Board of U. S. Pension Examining Surgeons for Somerset county; died at the home of his mother in Drayden, Maine, May 24, from pneumonia, aged 54.

Charles Ellery Stedman, M.D. Harvard Medical School, Boston, 1865; a member of the Massachusetts Medical Society; from 1861 to 1865 assistant surgeon in the U. S. Navy; and visiting surgeon to the Boston City Hospital from 1872 to 1886; died at his home in Brookline, Mass., May 24, aged 78.

George R. Pattillo, M.D. Medical College of Georgia, Augusta, 1876; for many years a member of the state and national medical associations; and formerly local surgeon for the Georgia Railroad at Culverton, Ga.; died at his home in Camak, Ga., May 23, from pneumonia, aged 58.

George O. Johnson, M.D. University of Maryland, Baltimore, 1869; of Fort Cobb, Okla.; a member of the American Medical Association; a member of the senate in the first and second legislatures of Oklahoma; died in Guthrie, February 10, from asphyxiation by natural gas, aged 63.

William S. Huber, M.D. University of Pennsylvania, Philadelphia, 1888; president of the select council of Lebanon, and of the Union Fire Company; a member of the surgical staff of the Good Samaritan Hospital; died at his home in Lebanon, May 25, from cerebral hemorrhage, aged 43.

Thales Irving Stanton, M.D. University of Vermont, Burlington, 1877; New York University, New York City, 1878; for thirty years a practitioner of Baltic, Conn.; died suddenly at his home in Franklin, Conn., May 26, from heart disease, aged 60.

John J. Ward, M.D. Albany (N. Y.) Medical College, 1869; a member of the Medical Society of the State of New York; and for more than thirty years health officer of Ellenville, N. Y.; died at his home, May 22, from asthma, aged 75.

Henri Charles Gunkel, M.D. Eclectic Medical Institute, Cincinnati, 1859; for many years president of a bank of Newport, Ky.; died at his home in Newport, May 24, from cerebral hemorrhage, aged 83.

Alexander Leslie McCormack, M.D. New York University, New York City, 1892; for twenty-two years a practitioner of East Boston; died at the home of his brother in Roxbury, May 25, aged 53.

Lucius Josiah Thayer, M.D. Long Island College Hospital, Brooklyn, N. Y., 1895; physician of the Shawmut Company, Elbon, Pa., for several years; died in Crenshaw, Pa., May 28, from cocaine poisoning.

Richard R. Thompson, M.D. Reform Medical College, Macon, Ga., 1854; a lieutenant in the Confederate service during the Civil War; died at his home in Cedartown, Ga., April 10, from influenza, aged 77.

Henry T. Cotton, M.D. Medical College of Indiana, Indianapolis, 1875; for fifty years a practitioner of Boone county, Ind.; died at his home in Zionville, May 29, from cerebral hemorrhage, aged 75.

Thomas L. Browne, M.D. McGill University, Montreal, 1881; for many years a medical officer of the Quebec militia; died suddenly at his home in Richmond, Que., May 26, from heart disease, aged 57.

John D. Sherer, M.D. University of Pennsylvania, Philadelphia, 1880; a member of the Medical Society of the State of New York; died at his home in Waterford, May 25, aged 52.

George Aldomer Cox, M.D. Albany (N. Y.) Medical College, 1868; a veteran of the Civil War; died suddenly at his home in Albany, May 21, from angina pectoris, aged 63.

Thomas Johnson Fain, M.D. Hospital College of Medicine, Louisville, 1897; a member of the Montana State Medical Association; died at his home in Norris, May 29, from tuberculosis, aged 37.

Leonard C. Whitford, M.D. Bennett Medical College, Chicago, 1870; for nearly thirty years a practitioner of Seattle, Wash.; died at his home May 26, aged 72.

Whitfield Murphey Buie, M.D. University of Louisville (Ky.), 1871; died at his home in Mertens, Texas, May 28, from cirrhosis of the liver, aged 61.

Reuben Goucher, M.D. American Medical College, Eclectic, Cincinnati, 1854; formerly of Molalla, Ore.; died at his home in Mulino, Ore., April 19, aged 76.

John Frederick Foard, M.D. Jefferson Medical College, Philadelphia, 1847; died at his home in Statesville, N. C., May 13, from cholera morbus, aged 82.

Gabriel Henry Bane, M.D. Medical College of Ohio, Cincinnati, 1897; died recently at his home in Orangeburg, Ky., from tuberculosis, aged 39.

Thomas Perry Robosson, M.D. University of Maryland, Baltimore, 1859; died at his home in Flintstone, Md., May 28, from paralysis, aged 75.

James B. Womack, M.D. University of Tennessee, Nashville, 1891; died at his home in Baucom, Tenn., May 25, from tuberculosis, aged 45.

Edward H. Graves, M.D. Missouri Medical College, St. Louis, 1878; died at his home in Boody, Ill., May 14, from appendicitis, aged 59.

George C. Pitzer, M.D. Eclectic Medical Institute, Cincinnati, 1866; died at his home in Los Angeles, Cal., May 10, aged 74.

Isadore L. Meyer (license, Kan., 1903); of Hiawatha, Kan.; died suddenly in Oneida, Kan., May 8, from angina pectoris, aged 58.

Marvin W. Cobb (registration, Ohio, 1884); died at his home in Fredonia, N. Y., May 19, from pericarditis, aged 63.

Henry Nebeker, M.D. Jefferson Medical College, Philadelphia, 1876; died at his home in Clinton, Ind., May 25, aged 63.

AMERICAN PEDIATRIC SOCIETY

Annual Meeting, held at Lenox, Mass., May 27-28, 1909

The President, DR. CHARLES P. PUTNAM, Boston, in the Chair

The officers elected for the ensuing year were named in THE JOURNAL last week in the department of General News and comment.

President's Address: State Care of Children

DR. CHARLES P. PUTNAM, Boston, urged the members of the society to take up a share of the work of the public institutions for children in their respective communities. These institutions, he said, were in fact great hospitals for chronic patients. The state's children he considered were juvenile offenders, truants, or dependent and neglected children, who should not be pictured as being on the whole healthy and normal. He described in detail the work done along these lines in Boston, and said he thought that the pediatricists were specially qualified by experience and training for this work, and he considered it incumbent on them to take up their share of the work of looking after these unfortunate children.

The Position and Work of the American Pediatric Society Toward Public Questions

DR. THOMAS MORGAN ROTCH, Boston, appealed to the members of the society to aid by their influence the safeguarding of early life. He stated that the chief point which we should aim at would be to persuade the enthusiasts who were doing such good work all over the country in connection with the different phases of early life to understand that they did not

know sufficiently all the different sides of the various questions connected with childhood, to allow them to control all the work themselves. He stated that the many workers who were trying to reform the laws in connection with child labor should understand that their great efforts were appreciated by the medical profession. He, however, had told them it was their province to drag crime out into the broad daylight, by crime meaning the unnecessary and cruel ill-treatment of children, by not legislating for them in a way that would protect them during the formative period of life. In the previous meeting at Chicago, he explained to them that when these children had been rescued from the mills, sweat-hops and various kinds of labor, which they were made to perform, before they were ready for it, it was then the province of the pediatricists to decide what these children were able to do. After this had been decided it was the province of the legal profession to inform the legislators what laws should be made for the preservation of child life in the sense of the child's health. He said that this same reasoning applied to those who had charge of the grading of schools and kindergartens and also of the physical sports of both boys and girls during their different stages of development. He explained that the old methods of determining at what age a child should be in the various grades in school and when he should work, for instance, in the mills, had mostly depended on chronologic age, and, again, as to height and weight. Children differed much, even though they were of the same age, in both physical and mental development, and judging development by chronologic age, must be very misleading. For the last three or four years Dr. Rotch had been endeavoring to obtain some more exact index, not of chronologic age, but of development, with the intention of thus deciding when a child should work in the mill by determining whether he had the proper strength derived from a proper development for such work. He presented what he called an anatomic index. He said that the development of the epiphyses presented an important part of a child's development so far as strength was concerned, and so far as showing what stage of development he was in. The epiphyses could be studied in all the joints—shoulder, elbow, knee and ankle—and very fine changes occurred in these joints. The joint which was easiest to read and in that sense most practical for forming an anatomic index was the wrist. In the majority of cases a normally developed wrist represented a normal development of the other joints. This development could be studied in successive grades from birth to 14 years of age by making use of the appearance of the osseous centers of the carpal bones and of the epiphyses of the radius and ulna. A Roentgen-ray picture could be taken of the wrist; this picture would represent a certain stage of development. This classification could be used for all ages, and in this way we could determine whether a child was ready to enter a kindergarten; or in which grade of the school he could be placed; or to what strain in athletic contests he could be allowed to go, and in what form of laborous work he might be employed. The influence of the society should be brought to bear on educators as well as on the child labor committee to induce them to look at the work which they were engaged in from some other point besides that governed by their own especial ideas and the lines in which they were working.

A Report on the Medical Work in the Juvenile Court of Chicago

Dr. F. S. CHURCHILL, Chicago, presented this report, which is based on the examination of 2,700 children, appearing before the Juvenile Court of Chicago during the last year; divided into the dependents and delinquents—dependent meaning one with no or ineffectual home care and delinquent meaning one who has transgressed the law. His analysis according to nationality showed 77 per cent. of foreign-born parentage; in proportion to the total population, the Polish lead. He examined as to the abnormalities of these children, paying especial attention to the height, weight and chest growth and the condition of the tonsils and adenoids, the condition of the eyes and ears, the condition of the teeth, heart and lungs, skin, and the frequency of venereal disease. The investigation

showed little organic disease among these children. The striking data were the high percentages of carious teeth, enlarged tonsils and cervical glands and defective eyesight, and the frequent occurrence of gonorrhea among the girls. Both boys and girls during the early years ran pretty closely to the normal, though a little below; among the delinquents they were very much below the normal, showing that the strain and stress of life that these children led began to tell on them at about the age of puberty. An exception to this general observation was the weight of the 16-year-old girls, who were shown to be 20 pounds heavier than normal girls and much better developed.

ASSOCIATION OF AMERICAN PHYSICIANS

Twenty-fourth Annual Meeting, held at Washington, D. C., May 11-12, 1909

(Continued from page 1876)

SYMPOSIUM ON TUBERCULOSIS

The Cutaneous Tuberculin Test

Dr. LAWRENCE BROWN, Saranac Lake, N. Y.: Much work needs to be done with the cutaneous test; it should not be pronounced negative until at least 4, or better 7 days, have elapsed. The old tuberculin should be used, and a 25 per cent. solution is probably as efficient as stronger solutions, but if the test is negative with a 25 per cent. solution, the full strength should be used for the second inoculation. Failure to react to the cutaneous test does not absolutely exclude reaction to the subcutaneous, nor does reaction to the cutaneous test indicate that reaction to the subcutaneous test will always occur. It is difficult to judge of the prognosis from the cutaneous test. Some serums, especially those from patients treated with higher doses of tuberculin, or from animals with high agglutinative powers, when mixed with weak dilutions of tuberculin, tend to retard the cutaneous test.

Sensitization in Tuberculosis

Dr. V. C. VAUGHAN, JR., Detroit: Sensitization is an important factor in tuberculosis. A positive reaction following the first instillation of tuberculin into the conjunctival sac is a strong confirmatory evidence of the existence of tuberculosis. A negative reaction following the first instillation of tuberculin into the conjunctival sac is of no value in determining the presence or absence of tuberculosis. A reaction of local sensitization obtained in an eye unaffected by previous instillation is strong evidence against the presence of tuberculosis. Failure to obtain a reaction of local sensitization in an eye unaffected by previous instillation is of no value in the diagnosis of tuberculosis. The treatment of pulmonary tuberculosis by cleavage products obtained from the bacillus itself has been followed by temporary improvement and arrest in certain cases.

The Influence of the Ingestion of Dead Tubercle Bacilli on Infection

Drs. M. J. ROSENAU and JOHN F. ANDERSON, Washington, D. C.: This is in the nature of a preliminary note. We have made some experiments to determine whether the ingestion of dead tubercle bacilli has any influence on subsequent infection. Our first series of experiments was done on guinea-pigs. At present we are carrying on experiments on two other species of animals. Of course, it is well-established that the injection of dead bacilli into animals is followed by local or general results, depending on the number injected, but whether the ingestion of dead tubercle bacilli has any influence is not so clearly established. In the first series we took 100 guinea-pigs and divided them into two lots. To 50 we fed dead bacilli for sixty days. At the end of that time the entire 100 were given large doses of live bacilli, and autopsies performed as soon after death as possible. It was found that on the average those that had been fed with dead bacilli died in 108 days; the controls in 113 days. This question is of practical importance, because in pasteurized milk we frequently ingest

large numbers of dead tubercle bacilli; and also in European countries tuberculous meat is sold, under official supervision, at a lower price. If the ingestion of such material would have any influence on subsequent infection, of course it is a matter of importance to determine the fact, and we hope we may be able to arrive at some definite conclusion on this subject when our experiments are completed.

An Index to Tuberculin Treatment in Tuberculosis by the Minimal Cutaneous Reaction Method

DRS. W. C. WHITE, D. A. L. GRAHAM and K. H. VAN NORMAN, Pittsburg: In a recent paper by White and Graham we described a volumetric quantitative method for applying the cutaneous test of v. Pirquet. In the application of this test we use various percentages of old tuberculin and a definite quantity of 0.01 c.cm. The tuberculin is applied to one spot and protected by an ordinary vaccine shield to allow as complete absorption as possible. From a study of a number of cases we have been able to show that local and constitutional reactions are a part of the same phenomena, and that a definite ratio exists between the amount of tuberculin applied cutaneously and that given subcutaneously for the production of local and constitutional reactions. We have found that one-fifteenth of the amount of O. T. which when applied to the skin by our method will produce the minimal cutaneous reaction, will when given subcutaneously produce both local and constitutional reactions; that one-thirtieth of that same amount subcutaneously will produce local reaction without constitutional, and that one-fiftieth of the minimal cutaneous reaction dose will produce neither local nor constitutional reactions when given subcutaneously. It is possible by this method to determine, first, the borderland of reaction and no reaction to tuberculin, which will be the degree of tolerance of the patient to tuberculin; second, the dose of tuberculin necessary to give the grade of reaction desired. In beginning treatment, we first determine the minimal cutaneous reaction point of the patient as described. This is obtained in the majority of cases with 12.5 per cent. O. T., using 0.01 c.cm. of the solution; i. e., the minimal reaction is obtained by the absorption from the skin of 1.25 mg. of O. T. From the ratios above mentioned 1/15 of the amount 1.25 mg., or 83/1000 mg. O. T., will produce both local and constitutional reactions; 1/30, or 4/1000 mg., local without constitutional; 1/50, or 25/1000 mg., no local or constitutional reaction. One-fiftieth, or 25/1000 mg., is therefore an amount of tuberculin which when given subcutaneously is just below the quantity necessary to produce local reaction at the site of injection in cases giving a minimal cutaneous reaction to 12.5 per cent. O. T. by the method described.

The Relative Importance of the Human and Bovine Types of Tubercle Bacilli in Human Tuberculosis at Different Periods of Life

DR. WILLIAM H. PARK, New York: Seventeen fatal cases of generalized tuberculosis in infants, in which the meninges were not involved, have been investigated. Twelve of these were due to the human type and five to the bovine type. Neither in age, in clinical symptoms, nor in pathologic findings, were any distinctive differences noticed which could be referred to the type of tubercle bacilli producing the infection. Ten cases of tuberculous meningitis were examined and all were due to the human type. Only two cases of abdominal tuberculosis were examined, and both were due to the bovine type. Twenty-nine cases of tuberculosis of the lymph glands of the neck were examined. Nine of these were of the bovine type, and the remainder of the human. There was no difference in the character of the cases, except that the majority of the bovine infections were in the younger children. In five cases of tuberculosis of the bones and joints all were due to the human type. There were examined four patients with pulmonary tuberculosis under 1 year of age, seven between 6 and 14 years, and 200 adults. In all the disease was due to the bacillus of human type. These results coincide so closely with the reports of other large series in different parts of the world that it looks as if there were little probability of further studies greatly

changing our present ideas of the relative properties of human and bovine infection. Bovine infection is certainly a considerable factor in the tuberculosis of children. In adults, on the other hand, it is almost negligible.

Discussion on Tuberculosis

DR. WILLIAM H. WELCH, Baltimore: Dr. Park's contribution is an extremely important one, especially the study of such a large number of cases of pulmonary tuberculosis without finding in a single instance the bovine bacillus, so far as that goes confirming Koch's contention at the last International Congress on Tuberculosis, at which he challenged any one to bring forward an authentic case of pulmonary phthisis due to the bovine tubercle.

DR. S. SOLIS COHEN, Philadelphia: It is important to be able to determine the minimal dose of tuberculin with which it is safe to begin treatment. My only experience has been in cases of laryngeal tuberculosis. For many years I was afraid to use it, but my brother obtained excellent results from the very first in the treatment of tuberculosis of the larynx, and recently I have been using it in those cases in which tuberculosis of the larynx coexisted with pulmonary tuberculosis, and always with good results, although not always with recovery.

DR. A. JACOBI, New York: Some time ago, Dr. v. Pirquet told me that of late he had been using the undiluted old tuberculin, and since then I have done the same. The method is very simple. I use only a small part of a drop. A single drop will suffice for twenty or twenty-five vaccinations. I scarify the skin, put the tuberculin on with a glass rod and leave it there a few minutes, having a control. I frequently use eosin simply to have something that may act as an irritant. A shield is put on, and I see the patient in three days, and almost invariably I have found the reaction positive in cases in which a general examination showed tuberculosis. I have never seen any untoward results.

NEW HAMPSHIRE MEDICAL ASSOCIATION

Annual Meeting, held at Concord, May 12-14, 1909

The President, DR. JOHN M. GILE, Hanover, in the Chair

Reports of secretary, treasurer, councilors and chairmen of committees were read and placed on file to be printed in annual report.

The matter of expert medical testimony was exhaustively discussed, and it was voted that the chair appoint a committee of conference to meet with a like committee from the New Hampshire Bar Association to draft some bill on expert testimony which might be made a law at the next session of the legislature. The following were appointed. Dr. F. A. Stillings, Concord; Dr. E. O. Crossman, Lisbon; Dr. G. C. Wilkins, Manchester; Dr. J. J. Cobb, Berlin; Dr. John M. Gile, Hanover.

The next legislative committee was instructed to make strenuous effort to have the law governing the practice of medicine in New Hampshire modified at the next session of the legislature in some important particulars.

The secretary was directed to advise Senator Gallinger that the New Hampshire Medical Society was opposed to any restrictions on animal experiments, such as was contemplated in the District of Columbia.

The house approved vascotomy as reported from Indiana, and voted to oppose the licensing of so-called optometrists.

The officers elected for the ensuing year were named in THE JOURNAL, May 29, page 1768.

President's Address: Problems Confronting the Society

DR. JOHN M. GILE, Hanover: In an organization like this two general methods of procedure are open: One along the line of a loose association with little machinery and little paternalism in its methods; the other a radically different principle suggested by the whole trend of affairs toward industrial and social organization. The latter means carefully constituted committees and delegated authority, and most diligent and painstaking work on the part of those officers.

Expert medical testimony, in its present status, has been more discussed and more villified, derided and condemned than it would seem possible for any system to be and live, but it is still with us and without prospect of change. The bill introduced in the New York Assembly in March, 1909, probably will not pass. I suggest that a committee of conference be appointed to meet with a like committee from the New Hampshire Bar Association for friendly consideration of the subject. The American Urological Association is directing its attention to a propaganda for the sterilization by vasectomy of criminals, idiots and other defective classes, and is requesting the New Hampshire Medical Society to pass resolutions favorable to the legalization of such procedure. The frequency with which the defective reproduces his own or a still more degenerate type is appalling, and this fact is not appreciated even by the members of the medical profession unless special study is given to the subject. That famous family whose genealogy is recorded under the name of "The Jukes," showed among 700 descendants 55 per cent. of criminals and paupers, and in the course of a century cost the State of New York over a million and a quarter of dollars. Segregation has been the approved method of applying a check to this state of affairs, but it is expensive to the state and unsatisfactory to the subjects so controlled. Indiana legalized vasectomy two years ago for criminals and defectives and 800 individuals have thus been sterilized. Oregon has enacted a similar law.

The matter of suits against physicians for malpractice is always one of disturbing interest to the profession, and is one that has loomed especially large in New Hampshire in the past year. An organization, within the society, for medical defense appears to be giving highly satisfactory results in the states where it is in operation. This would tend to rule out those cases that are nothing more or less than blackmail and that are brought in the hope that the physician will pay a small sum rather than be put to the inconvenience and expense of trial. The law which regulates the granting of license to practice in New Hampshire has several features which make it cumbersome and not without friction in its working. The existence of three examining boards seems to be a needlessly awkward and cumbersome arrangement. One board with representatives from each of the so-called schools of medicine—eclectic, homeopathic and regular—should be simpler, better co-ordinated and more efficient in action. The present law apparently does not distinctly prohibit any one from practicing medicine so long as he does not attach the title of doctor or M.D. to his name. Complaints have come from the cities that unlicensed individuals are advertising and practicing medicine under the title of "Professor" and that the authorities refuse to prosecute under the existing law. In an effort to improve the law the legislative committee presented to the last legislature a bill dealing with those particulars in what seemed to be a more satisfactory manner, but opposition developed from various and somewhat unexpected quarters. The only purpose which the committee had was simply to make a more consistent law; hence when the opposition developed it was thought wise to let it die in the committee. New Hampshire, in common with nearly every other state in the Union, has in recent years been through a definite campaign for the advancement of medical education. The result is the remarkable change in the medical course of study of to-day as compared with that of 15 years ago. In connection with this the fact is to be noted of a marked decrease in the last five years of the number of students matriculated in the medical schools of the country. In 1904 there were 28,142 matriculants and 5,747 graduates and in 1908 there were 22,602 matriculants and 4,741 graduates, a decrease of 5,540 students and 1,007 graduates.

Surgery of the Stomach

Dr. John B. Deaver, Philadelphia, discussed in detail the symptomatology and diagnosis of diseases of the stomach and summed up the situation in gastric surgery as follows: 1. The treatment of ulcer surgically is highly satisfactory,

but not perfect in its results. 2. With less danger in operating because of our present improved technic excision or resection of gastric ulcer will probably become much more frequent. 3. Chronic dilatation of the stomach is curable by gastroenterostomy, whether the pylorus be patulous or not. 4. Gastroplosis does not respond to surgical treatment. 5. Neuroses of the stomach are fit for surgical treatment only when their cause, being without the stomach, can be removed. Operations on the stomach for functional gastric conditions are always failures. 6. Carcinoma of the stomach in many instances would be curable if diagnosis would be made early; until our diagnosis is improved our results will continue to be poor. Unless we explore earlier and more often and not consider the responsibility of such procedure a grave one, we can not hope to progress in the surgery of malignant growths of the stomach.

DISCUSSION

DR. M. E. KEAN, Manchester: The problem would seem to be to evolve some plan of early diagnosis, so that the patient could be operated on while there was a good prospect of cure.

DR. F. B. LYNN, Boston: Within the last two years the subject of gastroenterostomy has developed immensely. I have tried hard to get some help from laboratory men. Many patients have been sent to me by physicians as early cases of stomach disease, and I felt a careful laboratory examination ought to be made. Two young working men came to me supposedly with stomach disease. Both looked the least bit anemic and had gastric pain. One was found to have cancer, which could not be operated on by gastroenterostomy, as there was not room. The other had cancer also. The surgeon has to depend on the common sense of the doctor who has seen the patient and knows him. Acute ulcers in young men ought to have treatment. A great many will be cured without operation if the medical treatment is kept up, but it will not be and the case will eventually come to the surgeon. Medical treatment is difficult and has to be long continued. The majority of ulcers are cured by gastroenterostomy; it is a simpler proceeding than resection. I believe with Dr. Deaver that gastritis should not be operated on.

ILLINOIS STATE MEDICAL SOCIETY

Fifty-Ninth Annual Meeting, Held at Quincy, May 18-20, 1909
(Continued from page 1882)

President's Address: The Relation of the Medical Profession to the Secular Press

DR. J. W. PETTIT, Ottawa: No agency is more potent for good or evil than the secular press. By secular press I mean more particularly the newspaper, which each day reaches fully 90 per cent. of the reading public. By far the larger part of the public, especially busy people, get about all their general information from the newspaper. It is the only printed source of information for fully one-half of the reading public. Any advertisement devoid of exaggeration, either expressed or implied, should be regarded as legitimate. It is not even this kind of advertising for whose recognition I plead, but that larger and more useful publicity which is mis-called advertising. Publicity may be defined as exploiting any medical fact which is of benefit to the public. Incidentally, more or less advantage will accrue to the publicity given to meritorious work done by the physician. This, however, is not advertising, but the legitimate reward for good work. The physician who furthers his own interest by doing good professional work is entitled to the reward which such service brings. This may be by scientific research, active society work, promotion of the public health, anything and everything that promotes legitimate medicine and the public welfare, and even though the motive may be fundamentally a selfish one, it should be encouraged. Many things are connected with our professional work of which the public has a right to know. There are also many to knowledge of which they have no right, and it would be a violation of professional confidence

to make public. The code is sufficiently clear on this point. I have observed that many medical men who advocate a narrow interpretation of the code are engaged in advertising by devious methods if we accept the doctrine that all publicity is advertising. The writing of useless books, the establishment of medical colleges for the primary purpose of securing the professorships, reading papers of doubtful value before medical societies as an excuse for the wholesale distribution of reprints, are some of the methods employed to evade the spirit of our code of ethics. This mad attempt to deceive and be deceived is responsible in a large measure for the establishment of so-called medical colleges, many of which are simply diploma mills, an evil which is not only a disgrace, but an absolute menace to our profession. One of the best means of mitigating these evils is to permit and encourage legitimate publicity along more rational and less harmful lines.

When Shall We Operate for Uterine Fibromata and Myomata?

DR. S. C. STREMMEL, Macomb: My assistant (Dr. Holmes) and I have operated in 61 cases, every one of which was complicated; four tumors had undergone carcinomatous degeneration, 1 sarcomatous, making 5 patients with malignant degeneration. The sarcomatous patient died 3 months after operation from recurrence, and one carcinomatous patient died in 6 months from recurrence. In the majority of our cases hemorrhage was a prominent symptom and was responsible for getting the patient's consent for operation. Ten tumors were large and produced pressure symptoms; 5 were complicated with ovarian tumors; 4 were multiple fibromata in which we were able to remove the growth without removing the uterus. One was a pedunculated fibromyoma weighing 19½ pounds; ascites and edema of the lower extremities and abdominal wall were extreme. A myomectomy was done; she recovered, and 2 years later gave birth to a child. We have never lost a patient from operation, but we have had some narrow escapes on account of undertaking cases away beyond the borderline of safety. I am convinced that we should advise operation for these tumors of the uterus as soon as the diagnosis is made, even before degenerative changes or complications occur. The only exceptions I make are those patients that any surgeon of average ability would refuse to operate on because of old age or a physical condition contraindicating operation.

DISCUSSION.

DR. WILLIAM CUTHBERTSON, Chicago: Many women present themselves for examination for other pelvic troubles and in the course of that examination we discover the presence of fibroid tumors. Unless these fibroids are sufficiently large to cause pain, displacement of the uterus, or profuse hemorrhages, I do not think we are called on to operate for their removal as soon as the diagnosis is made. Every practitioner of experience has seen cases of comparatively young women whose uteri have been studded with small fibroid tumors, yet they did not cause sufficient pain, displacement of the uterus, with accompanying constipation, disturbances of urination, to warrant operation; consequently I think we are safe in letting these young women go on and keep them under close observation.

DR. BERTHA VAN HOUSEN, Chicago: I have never been able to understand why a tumor of the uterus should be looked on any differently from a tumor of the breast. If a woman presents herself to me with a tumor of the breast, I would urge her to have it removed at once, and have a section of it examined microscopically, with a view of determining whether it is malignant or not. By this means we can get in the very early stages nearly all cases of carcinoma of the uterus. We know it does not do any harm to remove a small tumor from the breast; it is a simple operation; we know exactly what we are doing, and I believe the conditions in the pelvis are exactly the same.

SYMPOSIUM ON GASTRIC AND DUODENAL ULCER

Diagnosis of Gastric and Duodenal Ulcers

DR. CHRISTOPHER GRAHAM, Rochester, Minn.: In the majority of peptic ulcers the type of symptom is fairly suggestive, and a careful development of the history will lead

closely not only to a good diagnosis, but often to a degree of precision in ulcer location. The period of chronicity varies from 1 to 20 years, often running from 30 to 45. The average number of years in this series is between 12 and 13. The second characteristic feature is the periodicity of attacks. Are chronicity and periodicity peculiar to ulcer of the stomach? We find in gall-bladder disease, appendiceal colics and many general diseases this chronicity and this periodicity. Gallstone and appendiceal attacks come irregularly, increasing in severity as the attacks multiply. Pain is the most constant symptom of gastric ulcer. It is the time of pain or other symptoms; it is the regularity of pain and other symptoms; and it is the means by which the pain or other symptoms are relieved, that give the differential characteristics to gastric ulcer. Perforation is not infrequent and is acute or chronic. Chronic perforation causes adhesions to neighboring organs, reduces the motility of the stomach, which in turn decreases motor power and increases secretion. This increased secretion adds to the obstruction by causing pyloric spasm, while the spasm again heightens acid secretion, increases the pain, and threatens deeper ulceration. Hemorrhage which calls for radical interference is not so frequent as was formerly thought. As a complication, I would lay most stress on malignant degeneration, not because it calls for surgical relief oftener than does obstruction, malformation or perforation, but because it is the fruitful soil for cancer implantation. When cancer is once implanted, the cure has been proved most difficult, partly no doubt because the diagnosis is slow. In the differential diagnosis, three of the many conditions that call for attention are cancer, chronic appendicitis and gallstones. Until broader methods are evolved we must too often, in both gallstones and ulcer, rest satisfied with a surgical diagnosis.

Medical Treatment of Gastric and Duodenal Ulcer

DR. B. W. SIPPY, Chicago, discussed the medical treatment of gastric and duodenal ulcers, detailing a plan of treatment which, if rigidly carried out, will bring about good results.

Treatment of Non-Perforating Ulcers

DR. A. J. OCHSNER, Chicago: The surgical treatment of gastric and duodenal ulcer must depend on the accomplishment of three results in order to be practically successful: (1) It must remove all irritation from the ulcer in order to permit healing; (2) it must leave conditions so that the original cause of the ulcer is permanently eliminated; (3) it must leave a fairly satisfactory digestive apparatus after the patient has recovered from the operation. The irritation in persistent ulcer being due to the accumulation of severely acid gastric juice passing over the denuded surface, this irritation can be relieved by drainage at the lowest point of the stomach by gastroenterostomy, which at once prevents the accumulation of quantities of acid gastric fluid in the stomach and provides an outlet so that the fluid does not have to pass over this raw surface. Fortunately, the same procedure accomplishes the second and third conditions desired, provided the patient is carefully and persistently controlled in regard to taking non-irritating diet after the operation for the remainder of her life. In old suspicious-looking ulcers only will it be necessary to excise the pylorus, doing Rodman's operation, in order to prevent the implantation of carcinoma on the ulcer base. In ulcer accompanying hourglass stomach, excision and a plastic are frequently indicated. In perforative ulcer closure of the perforation should be done, and if obstruction follows subsequent gastroenterostomy is indicated.

Surgical Treatment of Perforating Gastric and Duodenal Ulcer

DR. J. E. ALLABEN, Rockford: I here report a case of perforating gastric ulcer which was operated on, with recovery of the patient, and draw the following conclusions: (1) Ulcers of the stomach and duodenum are much more common than is usually supposed; (2) the life of an individual with ulcer is perpetually jeopardized by the possibility of perforation; (3) the treatment of perforating gastric or duodenal ulcer is limited to surgical procedure; (4) the prevention of perforation means the early diagnosis of ulcer in the preperforative stage, and its treatment by excision or gastrojejunostomy.

Discussion on Ulcer

DR. JOHN B. DEEVER, Philadelphia: There is no class of affections that I approach with a greater degree of feeling of responsibility than stomach cases. I have felt for some time that too much was done on the stomach, and I have no reason to think otherwise. I am included among the number who have done too much. The more stomach surgery I do, the more I realize and appreciate the responsibility that we surgeons must have the courage to close the abdomen if we do not find a positive lesion, but in the past I have not done so. In the future I hope to do better. The avoidance of operation in acute hemorrhage is very important. Few patients die of acute hemorrhage of the stomach if treated medically; many die if treated surgically. That has been my experience.

DR. FRANK BILLINGS, Chicago: Many years ago surgeons were not so liberal in their expressions in the treatment of chronic gastric ulcers as they are to-day. I have expressed on previous occasions strong convictions that a certain class of cases should be treated surgically. I think we owe a great deal to Dr. Sippy, who read the paper on the medical treatment of gastric and duodenal ulcers, and who has worked out a systematic scheme for the treatment of these cases which is just as technical as the surgical treatment of ulcer, and which must be carried out in every detail in order to obtain satisfactory results. I believe that if medical men carry out in the future medical treatment with the same accuracy and technical skill as the surgeon does his work, there will not be this controversy we have had in the past, and it will grow less in the future regarding the cases which are medical and those which may become surgical. That is true, for in the past the majority of us have been remiss in the medical treatment of ulcer of the stomach.

DR. ARTHUR DEAN BEVAN, Chicago: These papers are the best examples of borderline work we have had for a long time. They show that it is absolutely essential, in order to achieve the best results, to have the diagnosis made and the medical treatment go hand in hand with the surgical handling of these cases. I feel I am fortunate in being associated with three or four medical men where we handle these cases by combining our efforts or by doing team work. This getting together of the internists and surgeons is the only way in which this subject can be satisfactorily worked out. I have gone through the same experience as most surgeons in the last five or eight years of having operated on a certain number of cases which were medical, and not surgical. On the other hand, I must say, in properly selected cases there is hardly any group of surgical cases so satisfactory as those which pertain to the stomach. Take a patient with obstruction of the pylorus; whose normal weight was 180 pounds, but he has declined in weight to 120 pounds; whose life is miserable; whose disposition is absolutely changed because of his continual suffering—that patient within six months after a simple gastroenterostomy regains his normal weight and returns to a condition in which he can enjoy life. The results from this operation on these cases are wonderfully satisfactory.

Gallstone Disease

DR. JOHN B. DEEVER, Philadelphia: The ideal treatment of any disease, or disease process, involves, first, temporary relief of the patient, and, second, the prevention of a recurrence by removal of the primary cause. That there are some cases of gallstone disease unsuitable for radical treatment none would be so rash as to deny. The very old, those who have other grave organic diseases, as of the heart, lungs, or kidneys, can not be considered favorable cases for any kind of operative interference. We can not differentiate a stone-forming biliary catarrh from any other mild biliary catarrh, and so it is necessary to wait until stones are actually formed before we have a basis for operation. The time of election for operative interference is when we have to deal with gallstones entirely within the gall bladder and when complications have not yet set in. When we find gallstones, they must be removed and their cause, if possible, done away with. The first requirement we can only fulfill by a most careful exploration of the viscus and its ducts in every instance. In the hand of so

competent an operator as Hans Kehr, calculi were overlooked in 2 per cent. of all cases. With surgeons less experienced in this line of work it is natural to suppose that this percentage is still larger and that the stones left behind account for many a case considered as one of recurrence after operation. With proper technique, however, there should be exceedingly few cases in which calculi are left behind. The removal of the cause involves an attempt to overcome the infection giving rise to the stone-forming catarrh. I hold that in every instance we should take for granted the persistence of such a catarrh, in spite of bacteriologic evidence to the contrary, and should drain in every case. It is not sufficient to provide for an open gall bladder only that drainage which it receives through the biliary tract. Who would think of allowing a possibly infected kidney to drain itself only through the ureter? Ideal cholecystotomy has fallen into well-merited oblivion. I believe that without thorough drainage we may have a temporarily curative operation for gallstones, but its effect as a prophylactic against their future formation is entirely lost. Perhaps the point of technique on which operators are still most divided is the removal of the gall bladder. I do not agree with those who hold that it should be removed whenever it is possible to do so. Not only is the mortality of cholecystectomy somewhat higher than that of cholecystostomy, but there are certain other disadvantages connected with the entire removal of the gall bladder. Adequate drainage of the bile tract is more difficult to secure and is less prolonged. If the stone-forming catarrh still exists, this may give rise to the formation at a later period of calculi within the duct, where they are apt to cause more difficulty; and, lastly, we are removing without a suitable substitute a bile reservoir which probably has some function which we do not as yet understand. The more complex details of the technique of gallstone surgery do not belong to a brief summary such as this. After all, the surgeon of to-day should be able to see that while technical detail is of great importance, correct diagnosis and understanding of underlying processes are still far more essential. In gallstone disease further progress will depend not on advances in operating only, but on earlier recognition and understanding of the disease process as a whole.

Poisoning from Bismuth-Subnitrate-Vaseline Paste

DR. V. C. DAVID and DR. J. R. KAUFFMAN, Chicago: After reporting five such cases, we draw the following conclusions: 1. Poisoning from bismuth-subnitrate-vaselin paste is more common than we had supposed. Since the report of these cases, in an examination of about 25 orthopedic cases in the Cook County Hospital in which bismuth-vaselin paste had been injected into tuberculous sinuses more than once, we found that in 6 patients there was more or less blue pigmentation of the gums. In one of the patients extreme blue pigmentation was present on the gums, the lips and the cheeks were without subjective symptoms. From this we have reason to believe that pigmentation of the gums is an early sign of bismuth intoxication, and should be taken as a signal to discontinue the injection of the paste for a time. 2. In the reported cases, 4 of the 5 patients received 6 ounces or less at the first injection, and 10 ounces or less in toto. 3. One fatal case occurred after the use of less than one ounce of paste. 4. Toxic symptoms developed after the first injection in from 10 days to 6 weeks, both extremes being the fatal cases. 5. The use of the x-ray apparently is not a factor which might influence poisoning because some of these patients were not skiagraphed after the paste was used. 6. There are acute and chronic cases of bismuth poisoning, the former being fatal, with general symptoms, and the latter tending to slow recovery with practically only local manifestations, but the onset of both is very much the same. 7. So far, no case of pure nitrate poisoning following the use of the bismuth-subnitrate paste is on record, and though there is but one case in which the nitrate played a part in the poisoning, it seems as though that danger should be avoided by the use of bismuth carbonate. 8. Impurities in the bismuth-subnitrate are not factors in the poisoning, because, metallic bismuth has been found in the local pigmented areas, and in two well-defined cases the analysis of the bismuth showed no considerable amount of impurities.

Medicolegal

Liability for Preventable Fits

The Supreme Judicial Court of Massachusetts says, in the personal injury case of *Dooley vs. Boston Elevated Railway Co.*, that while it might be conceded that the evidence of the experts as to the power of the plaintiff by a general course of life to lessen the spells she had, or to control them in any degree, was, taken as a whole, not very illuminating, yet it would have warranted a finding that by a proper and reasonable use of such will power as the plaintiff had she could lessen these spells by improving her general tone, and, further, that if she resisted the impulse and did not "let go of her feelings" she could control them to a certain extent.

In this state of the evidence it was asked that the jury be instructed that if they found there was such physical injury as to permit the recovery of damages for mental suffering or disease also, then in determining the damages to be awarded for mental suffering or disease the jury must eliminate from consideration such of the plaintiff's symptoms or demonstrations, if any, as could have been prevented by the exercise of such self-control as the plaintiff was capable of at the time of such symptoms or demonstrations. Also that if the jury believed that the plaintiff had had fits, spasms, or spells, since the accident, and believed that the coming on of such fits, spasms, or spells was always or sometimes under the plaintiff's control in the sense that she could, by the exercise of the will power or self-control of which she was capable, have always or sometimes prevented them from happening, had she wished to do so, then so far as that was the case she could not recover for fits, spasms, or spells so preventable, or for their consequences. These instructions were applicable to a possible view of the evidence that the jury might take, and their general accuracy could not be successfully questioned.

But, instead of such instruction being given, the jury were told that the question might be whether the fits, spells or spasms, as they had been called, were voluntary or involuntary, and that if the jury said that they were entirely under the plaintiff's own control, and that she need not have one unless she saw fit to, and she had it because she wished to, then these should not be taken into account so far as she could avoid them, whether they caused suffering or not. This, under the circumstances, was error.

The requested instructions had reference not so much to the spells which the plaintiff had "because she wished to," but to such "as could have been prevented by the exercise of self-control," and there is a material difference between the two classes. The first more aptly describes a fit to which the active will of the victim contributes, the second a fit where there is no active exercise of the will to prevent it. The first implies an active exercise of the will, the second simply a sluggish inaction, a negligent quiescence of the will. The instruction given fairly covered the law as to the first class, but it utterly ignored the law as to the second class.

It was further to be observed that this omission was material on what might be regarded as a tender spot in the case; a spot where the jury would be likely to sympathize keenly with the plaintiff. On all the evidence the plaintiff was in a condition likely to appeal to a jury. A young woman, healthy both in body and in mind, and cheerful in temperament, had become an invalid and morose, and she was seeking to hold the defendant responsible for this change. Under these circumstances it was the right of the defendant to have defined with precision the legal limits of its responsibility.

Insanity and Testamentary Capacity

The Supreme Court Commissioners of Nebraska say, in the *Ayers' will case*, that it might be admitted that the testator, pathologically considered, was insane for many years; but the real question was: Was his mind so diseased that his mental freedom was perverted and his understanding destroyed so that he was incapable of knowing and comprehending in a general way the natural objects of his bounty, the nature and extent of his estate, and the distribution he wished to make of it?

The medical definition of insanity as given by Dr. Hammond in his work on *Diseases of the Nervous System* (page 332), is a manifestation of disease of the brain characterized by a general or partial derangement of one or more of the faculties of the mind, in which, while consciousness is not abolished, mental freedom is perverted, weakened or destroyed.

The older view regarded the human mind as a single indivisible potency not comprising distinct functions, and consequently that any impairment thereof must be absolute, and not partial. But modern medical science recognizes, as shown by the definition above quoted, that there may be a partial derangement of one or more of the faculties of the mind, leaving others practically unimpaired, and hence arises what is called partial insanity.

This court has laid down the rule that where the insanity is not general, the question to be determined is whether the subject was the victim of such delusions as controlled his actions and rendered him insensible to the ties of blood and kindred. *McClary vs. Stull*, 44 Neb. 175. A very full discussion of the degree of soundness of mind required for the making of a valid will and a full citation of authorities will be found in the case of *Perkins vs. Perkins*, 116 Iowa, 253.

The law makes no distinction between mental incapacity whether congenital or caused by age, sickness or disease, and it therefore follows that partial insanity does not necessarily disqualify a testator from making a valid will. Some courts have gone so far as to say that, when there is nothing unreasonable on the face of the will by one habitually insane, it will be presumed to have been made in a lucid interval. *Kingsbury vs. Whittaker*, 32 La. Ann. 1055.

Wherefore, the Supreme Court of Nebraska holds that where it appears that a testator had been on various occasions temporarily confined in a hospital for the insane, but in the intervals was competent to transact with judgment and discretion his ordinary business, and had sufficient strength of mind and memory to know and comprehend and retain in his mind those who were or naturally should have been the objects of his bounty, the nature and extent of his estate and the distribution he wished to make of it, and that during such an interval he executed in due form his last will and testament making a reasonable distribution of his estate, a judgment probating said will should be sustained.

"Defect of Reason" and Criminal Liability

The Court of Appeals of New York says, in the case of *People vs. Carlin*, that under the statute of that state, which embodies the English rule laid down in the celebrated *McNaghten Case*, 1 C. & K. 134, a person is not excused from criminal liability as an insane person except on proof that at the time of committing the alleged criminal act he was laboring under a defect of reason, which, furthermore, must have been such as to render him either (1) ignorant of the nature and quality of the act he was doing, or (2) ignorant that the act was wrong. This is the only test of responsibility known to the law of the state of New York. The phrase "defect of reason" in the statute means disease of the mind, and a person who has committed an act otherwise unquestionably criminal may not be relieved from the consequences of that act where insanity is relied on as the sole defense, unless at the time of the commission of the act he was suffering from some disease of the mind. Material neglect has never yet been recognized as an excuse for matricide, and no matter how firmly the defendant may have been convinced that it was not wrong for him to kill his mother, his convictions to that effect could avail nothing as a defense unless they were the outcome of mental derangement.

Admissibility in Evidence of Disclosures to Physicians in Homicide Cases

The Court of Appeals of New York says that in the homicide case of *People vs. Hill* the defendant was examined by an expert for the people, who, before making the examination, told him that he had been requested by the district attorney to

make an examination of him and to ask him questions regarding himself and the accident. He then asked him to be free and frank with him, stating that he would use him right, and that he need not tell him anything that would incriminate himself so far as the deed was concerned. At the trial the defendant's counsel objected to the witness testifying as to any statement made by the defendant on the ground that the witness had promised the prisoner that he would treat him all right. It was claimed that this was an offer by which the defendant was induced to make statements to him on the understanding that he would not testify against him. The court's conclusion with reference thereto, however, is that such was not the fair or reasonable interpretation of the statement. There was no disclosure of the details of the homicide called out by the physician nor given by the defendant which was at all in controversy. The physician's examination of him, so far as questions were concerned, pertained to his memory, history, his family relations, diseases, and the extent to which he had indulged in drinking intoxicants. He then subjected him to a physical examination for the purpose of determining, as far as possible, the presence of any disease. The court finds nothing in this on which error could be predicated. But the court holds that the declarations of the defendant made to another physician as to his recollections of transactions after the alleged homicide, but long before the time of the interview with the physician, were not competent evidence.

Current Medical Literature

May 29

- 1 *The Etiology of Pain. E. G. Janeway, New York.
- 2 Hay Fever and Other Rhinologic Causes of Asthma. W. W. Carter, New York.
- 3 Myelogenous Leukemia. C. W. Cutler, New York.
- 4 The Future of the Alcohol Problem. T. D. Crothers, Hartford, Conn.
- 5 *Administration of Anesthetics. H. J. Boldt, New York.

1. Etiology of Pain.—Janeway discusses pains of various kinds and says that we should be cautious in labeling a severe pain as hysterical. He cites cases in which pain supposedly hysterical proved to be due to some serious condition. Pain due to toxic influences may baffle us unless we make diligent inquiry of the patient and his friends. Sciatica should be carefully scrutinized, since a condition that seems simple may be caused by pressure of a malignant growth. Pain in the abdomen may come from the kidney instead of the appendix, and it requires careful search to know whether pain comes from the kidney, gall bladder, or appendix. Pain or tacia may simulate some of these conditions. Pain in angina pectoris is severe and characteristic, and when combined with increased blood pressure and ashy lips it should not be mistaken.

- 6 Early Career of Sydenham, with Remarks on the Men and Medicine of His Time. C. G. Cumston, Boston.
- 7 *Cancer of the Cervix Complicating Pregnancy. J. T. Williams, Boston.
- 8 *Classification of the Malarial Plasmodia. C. F. Craig, U. S. Army.

7. Cancer of the Cervix.—As the result of an examination of the records of the Boston Lying-in Hospital, Williams draws the following conclusions:

1. Cancer of the cervix does not prevent conception, and in a large percentage of cases antedates the pregnancy.
2. Cancer of the cervix, as a rule, grows with great rapidity during pregnancy and the puerperium.
3. While the prognosis of cancer of the cervix is more grave during pregnancy, it is not hopeless.
4. When an operable cancer of the cervix is discovered during pregnancy, no matter at what period, immediate operation is indicated.

5. Up to the present time statistics favor the Wertheim operation, preceded by Cesarean section if the child is viable.

6. In inoperable cancer with a living child at term, conservative Cesarean section is the method of choice. If the child is dead, or premature, a subpubic delivery will give the best result.

8. Classification of Malarial Plasmodia.—Craig discusses this subject and proposes the following classification:

Division.	Protozoa
Class.	Sporozoa
Order.	Hemosporidia
Genus.	Plasmodium.
Species:	

1. *Plasmodium malaria*, Marchia and Celli. Quartan malarial plasmodium
2. *Plasmodium vivax*, Grassi and Feletti. Tertian malarial plasmodium
3. *Plasmodium falciparum*, Blanchard. Estivoautumnal plasmodium, tertian type
- Sub species
1. *Plasmodium falciparum quotidianum*, Craig, 1909. The quotidian estivoautumnal plasmodium

10. Theories and Problems of Heredity.—In this article Wright discusses cancer as a problem of heredity in its bearing on the problems of histology. He pays special attention to mouse cancer. He says that if cancer research in animals has thrown an expected light on cancer in man, it has thrown considerable light, it seems to him, on the problems of heredity, and certainly an unexpected light on histology and on embryology, that recapitulation of heredity. Hitherto the view has prevailed that the stroma of an epithelial cancer is derived from the connective tissue surrounding it. Wright thinks that in the future this can hardly be maintained in its entirety, in view of the rising flood of testimony to some of which he had referred. All his experience goes to support the view that the type of tumor in the human individual remains practically the same, so far as structure is concerned, throughout the life of the host, and while he can not but believe that epithelial cells may furnish stroma and connective tissue cells, a benign tumor does not change to a malignant one, nor does the latter change its type except very rarely. That it does so occasionally in the one human host perhaps can not be denied, but he has never seen any proof of it in practice, nor has he ever seen any adduced literature satisfactorily establishing the fact. Malignancy is not an expression which belongs to objective diagnosis. It refers to the host, not to the cancer guest. Final as the testimony of the microscope is so frequently thought to be, it is by no means a court of last resort. It can never be sufficiently urged that the biologic activities evidenced in the clinical history and the biologic condition noted in the structure must be correlated in forming an opinion as to the fate of the patient. Clinical experience combined with histologic observations has not demonstrated the fact that "the virulence of a tumor is the measure of its histologic structure" (Apolant and Ehrlich) with sufficient accuracy to make the opinion of the histologist as to the degree of malignancy in any given specimen of any great value.

13. Enucleation of the Faucial Tonsil.—MacWhinnie praises digital enucleation of the faucial tonsils on the following grounds: (1) Rapidity of the operation; (2) absolute non-recurrence if removed in its capsule; (3) minimum amount of hemorrhage and subsequent anemia; (4) the importance of starting on the outside of the capsule; (5) ease of performance, so amputation should never be thought of, even as a palliative measure. He describes the procedure as follows: The point of importance that should be remembered is to begin the procedure outside of the capsule, in the posterior inferior portion of the sinus, working up to the supratonsillar

fossa. The finger is then brought to the posterior inferior portion of the sinus, working up to the supratonsillar fossa. The finger is then brought to the original starting point and the same procedure is carried out, posterior to the anterior pillar, into the supratonsillar fossa to meet the first dissection; the finger is then carried to the original starting point, and by working forward, the thumb being on the anterior surface of the tonsil the enucleation is completed, the gland coming away in its capsule. At this point the operator should not try to pull the tonsil, for if he does some of the superior constrictor may come as well and hemorrhage result. When starting the procedure, the operator should begin on the outside of the capsule; there is almost no danger of getting inside of it, for if he did it is manifest that the work would be incomplete.

- 19 The Invalid's Vacation. G. H. Tarson, Mount Clemens, Mich.

16. **Wandering Spleen.**—Hinchey reports a case with the following features of special interest: During the years 1905 and 1906 when the patient was passing through the severe nervous manifestations that were ascribed to the menopause, she presented the clinical symptoms common to splachnoptosis. Prior to that time and since the menopause these symptoms were never observed. There is the same general ptosis now as then, with the lower border of the stomach below the navel, the right kidney readily palpable opposite the navel and freely movable, decensus of the liver and transverse colon, great laxity of the abdominal parietes, depression of the epigastrium and marked bulging of the hypogastrium; yet despite these conditions there are none of the usual symptoms commonly ascribed to splachnoptosis. Bearing this in mind, Hinchey believes that the removal of the diseased ovary *per vaginam*, with thorough repair of the pelvic floor, will relieve her of all her symptoms. The patient's marked ability to cope with the tubercle bacillus is also worthy of comment.

26. **Atypical Tubercle Bacilli.**—Duval reports the study of four cultures of tubercle bacilli recovered from cases of a peculiar primary cervical adenitis in man, three of which died of acute general miliary tuberculosis. One of these cultures is of the human, another of the bovine type, while two are intermediate or atypical. One of the latter is of special interest. The case from which it was obtained ran a rapid

course; enormous numbers of bacilli were found in the tissues and they were highly virulent for rabbits and guinea-pigs, easily cultivated, and resistant to unfavorable conditions. Because of these characteristics and also because it produced lesions in chickens, it is regarded as an avian type of bacillus. Duval does not believe that the morphologic characters of the bacilli of different cultures afford much aid in differentiation, because these characteristics may vary, depending on the kind and reaction of the media.

27. **Kidney Extracts and Blood Pressure.**—Pearce finds that extracts of the kidneys of various animals may increase or diminish blood pressure, depending on the animal injected. Such substances have not the constant effect on all animals that extracts of the adrenal gland have. Extracts of kidneys the seat of different forms of nephritis have the same effect as extracts of normal kidneys.

28. **Pneumothorax and Posture.**—Elsberg finds that when a dog lies on its belly the heart falls toward the anterior chest wall, and supports the anterior septum between the two pleural cavities. This septum is weaker than the posterior septum, and is apt to rupture with the violent respiratory movements that take place when the pleura is opened if the dog is on its back. The danger of open pneumothorax is greatly lessened when the animal is in the prone position.

29. **Effect of X-Rays on Increase of Leucocytes.**—Injection of pilocarpin hydrochlorate into the muscles of a dog causes a definite increase of leucocytes in the circulation. So far as the mononuclear cells are concerned, this increase is interrupted by the action of x-rays, while the polymorphonuclears are relatively slightly reduced in number by this action. Dixon believes that the greater decrease of mononuclears by the use of x-rays perhaps is explainable by the fact that the parent cells of the polymorphonuclear leucocytes are not so accessible to the rays because of their situation in the interior of bone.

30 and 31. **Edema.**—Calcium chlorid, adrenalin and myocardial lesions each in a specific way effect elimination of fluid by the kidneys, by the mucosa of the small intestine, and by the lining of the peritoneal cavity. Hence Loeb and Fleischer conclude that the conditions influencing the elimination of fluids by these three surfaces must be different in each case and peculiar to the cells lining the surfaces.

32. **Intracranial Pressure.**—Increase of blood pressure resulting from increase of intracranial pressure over the blood pressure, takes place in the dog owing to constriction of the vessels of the intestines, kidney and limbs. In the brain the increase of intracranial pressure causes complete anemia. When the intracranial pressure is not so greatly increased, some of the larger connections at the base of the brain are more or less well injected. In the dog, the internal maxillary artery plays an important part in the cerebral circulation, and because of its position within the cranial cavity it is unaffected except by extreme degrees of intracranial pressure.

37. Disinfection of Passenger Coaches.—Amyot describes the construction of an inexpensive structure, which is practically a disinfecting house, wherein formaldehyd or potassium cyanid disinfection of one or more railroad or other cars can be carried on.

38, 39, 50, 55. Abstracted in THE JOURNAL, Sept. 12, 1908, pp. 939, 941, 942.

42. Sociology of the West.—Fagan contrasts social conditions in the west with those in the east and in Europe. He regrets the too great independence of restraint among children. While the spirit of independence is good, too great freedom of action at an age when neither discretion nor judgment is developed is not good. He deplors the uncontrolled shaping of their own educational courses by juveniles, their attending or leaving school at will and selection of a calling, often in direct opposition to the parental wish. The teaching in hygiene is poor, he asserts, the teachers largely unlearned in science, and the text-books used a farce.

47. Diphtheria in Guadalajara.—Lopez describes an epidemic of diphtheria in an elevated city, which led him to the conclusion that the contagion of diphtheria is very inferior to that of measles, smallpox or scarlet fever.

48. Tuberculosis and Poverty.—Lies discusses the mutual interaction of tuberculosis and poverty, and says that what we need in this country is an adaptation of the German system of industrial insurance, which would have the effect, as it has in Germany, of encouraging a man to undertake treatment for tuberculosis early, when he is still in a curable stage, instead of waiting because of the expense involved, until he goes over the incurable line.

59. Industrial Diseases.—Hutchcroft points out that the old mortality grouping by occupations is, nowadays, apt to be misleading. It is evident, from the division of labor which has come about in most of our industries, that the work done by one set of laborers in an industry might be very unhealthy and cause some special form of occupational disease, while the employes in the remainder of the industry might not be subject to any destructive agencies. It is the particular

branch of the industry which develops an occupational disease with which we are concerned, although for purposes of comparison it would seem desirable to study the industry as a whole.

63. The *Bacillus Typhosus* in Tea and Coffee Milk.—Hill's experiments indicate that the epidemiologist, in listing those exposed to infection from a given milk supply, should not eliminate those who drink milk only in coffee or tea; for he has demonstrated that *Bacillus typhosus* survived in a mixture of milk with hot coffee or tea, and could be recovered from it twenty-four hours after the mixture was first made, except when the initial temperature of the mixture was above 68 C. Coffee or tea can not be used as a drink by most people at a temperature above 50 C.

- 72 Guillotin. F. J. Lutz, St. Louis.

68. Rectal Anesthesia.—Carson reviews the history of this procedure of which he thinks the alleged dangers more imaginary than real, basing his opinion on an examination of the recorded fatal cases. He reviews the physiology and has been surprised in his series of cases by the rapidity of the absorption. The advantage, besides the removal of the anesthetist from the field of operation, is lessened fatality, owing to the lung being free to eliminate ether as fast as it is absorbed, so that it can safely be used when there is involvement of the lungs. Carson believes this method to be especially applicable in goiter operations. He uses Sutton's simple apparatus. He describes the technic and reports 16 cases in 2 of which death occurred from surgical shock and in one from medullary pressure in a brain case. He is convinced that the application of this method in properly prepared cases—he insists strongly on the method of preparation—has many advantages over the inhalation method.

71. Circumscribed Serous Spinal Meningitis.—Bliss discusses the etiology of this condition, and says that his own case gives a very clear history of traumatic causation, but whatever may be ultimately determined as to the most frequent causative factors, it is well to remember that the symptoms may come on insidiously and slowly. A history of intercostal neuralgia, of mild or severe type, is not unusual if the seat of greatest compression is in the dorsal region; in the lumbar region, lumbago, anterior crural or other nerve group neuralgias, may occur primarily, to be followed later by a rather even anesthesia and analgesia, associated with cramping of muscles and increased deep reflexes, and by bladder and rectal signs. An upper limit of the lesion can usually be determined.

96. Exophthalmic Goiter.—McDonald concludes, from a review of the subject, that the symptoms of exophthalmic goiter are due to the excessive activity of a thyroid gland, the seat of certain characteristic changes indistinguishable from hypertrophy. He asks: Why should the process of hypertrophic compensation, elsewhere a beneficent and reparative function, here so far overstep its authority as to produce a symptom-complex which is certainly pathologic? And: What is the ultimate cause of this overstimulation? The overcompensation he considers to be in response to the continued action of certain toxins or stimulation bodies. In regard to the second question, he refers to reported cases confirming the suggestion of McCallum, that the underlying cause is an infection of some type—influenza, septic infection, scarlatina, diphtheria, cerebrospinal meningitis, measles, smallpox, purulent peritonitis or tuberculosis. In a case that he has had under observation for some months, the patient has a preceding history of long and severe typhoid fever. Little accurate work in exophthalmic goiter therapy can be hoped for until we have more conclusive information regarding the physiology of the gland.

113 The Behavior of the Gonococcus in Carbohydrate Media. T. Watabiki, Tokyo, Japan.

102. Acute Pancreatitis.—Frothingham concludes that, under certain undetermined conditions, polymorphonuclear leucocytes immigrate into the pancreas in sufficient numbers to cause

considerable lesions; this occurs more frequently in acute infectious diseases than in chronic diseases; as yet the lesions have not been correlated with clinical symptoms.

104. Leucocyte Extract in Staphylococcus Infection.—Hiss and Zinsser have no hesitation in concluding that "marked improvement in, and cure of, localized staphylococcus infection may be obtained by careful and systematic treatment with leucocyte extract." The extracts were obtained from rabbit leucocytes, treated with distilled water, and administered by subcutaneous injection.

105. Intoxication After Antitoxin Injection.—Lucas and Gay describe an immediate local edema and infiltration with tenderness, followed in untreated cases by necrosis, in persons re-injected with diphtheria antitoxin. The percentage showing this reaction increased with the number of injections at short intervals after a primary injection. The reaction corresponds to Arthus' phenomenon in rabbits.

107. Surgical Shock.—Dolley describes definite alterations in the Purkinje cells of the cerebellum of dogs in which surgical shock was produced by manipulation of the abdominal contents. The changes followed a definite course and occurred in animals in which the possible influence of anemia was eliminated by transfusion of blood from normal dogs.

110. Specificity and Sensitization.—Lord finds that the cutaneous tuberculin test in man fails to give evidence of a specific and differential quality in human and bovine tuberculin. This result in man corresponds to the results obtained with differential tuberculin tests in animals, and emphasizes the very intimate relationship, so far as susceptibility to reaction is concerned, between the human and bovine types of tubercle bacilli.

111. Modification of von Pirquet Tuberculin Reaction.—White and Graham express their conviction that cases of tuberculosis, except advanced ones, not reacting to the cutaneous tuberculin test, using 0.02 cm. of 100 per cent. Koch's old tuberculin, must be considered as free from tuberculosis or as having very inactive lesions.

112. Agar-Gelatin Medium.—Agar-gelatin medium described by North is made as follows (1 liter): Extract of one pound of lean beef or veal, extracted with 500 c.c. of water for eighteen hours; 10 grams of agar; 20 grams of gold label gelatin; 20 grams of dried peptone (Witte's); 5 grams of sodium chlorid; water to make one liter. The reaction is adjusted to the neutral point in the usual way, using phenolphthalein as indicator. The medium is favorable for the growth of pneumococcus, meningococcus, gonococcus and other bacteria ordinarily kept on hand. It can be used at 37 C., as well as at lower temperatures, and is recommended as a convenient routine medium.

113. The Gonococcus.—Watabiki finds that on carbohydrate media gonococcus ferments only mannite, dextrose, dextrin and levulose, indicating an absence of the varieties usually found among other bacteria. He also failed to obtain indications of the existence of varieties by means of certain serum reactions.

3. *Bacillus Pyocyaneus* Pyemia.—Groves reports the case of a boy, of 10, who was operated on in August, 1908, for lameness due to fixation of the left hip. In November, 1907, he had had two abscesses, one in the right groin, the other on the inner side of the left thigh, the latter healing very slowly. The operation in August, 1908, was followed immediately by what proved to be a severe pyemia, from which a culture of the *Bacillus pyocyaneus* was isolated. A vaccine was prepared, and first 40, then 60 millions, increased later to 100 millions, of bacilli were injected, at intervals grading from a week to a fortnight. From the date of the second injection the boy's condition has rapidly improved. A peculiar feature in this case was that the patient exhibited three different varieties of pathologic dislocation of his joints: 1. Dislocation by destruction of bony surfaces; illustrated by the tuberculous left hip. 2. Dislocation by destruction of ligaments and the traction of muscles; illustrated by the right thumb. 3. Dislocation by distention of the capsule; illustrated by the right hip. Groves summarizes as follows the lessons of this case:

1. The danger of trusting to an "aseptic" system of surgery when dealing with the region of the groin. He now always uses 1 in 2,000 biniodid of mercury as lotion in these cases when asepsis is doubtful.
2. The absolute importance of an exact bacteriologic diagnosis in every case of suppuration.
3. The great gravity of *Bacillus pyocyaneus* infection.
4. The potency of vaccinal treatment of this infection.

7. Sleeping Sickness.—Balfour is led by a perusal of McKenzie and Martin's treatment in cerebrospinal meningitis—that of introducing locally, by spinal puncture a highly immune serum obtained from the blood of patients who have recently recovered, or, in acute cases, of injecting the patient's own serum—to suggest that a somewhat similar method of sero-therapy might be tried in cases of trypanosomiasis and sleeping sickness. He discusses the theory only as a suggestion, but thinks that anything likely to prove beneficial should be tried in cases of sleeping sickness.

10. Heredity or Infection in Tuberculosis.—The stress laid by insurance companies on a death from tuberculosis in the family of the applicant, tends to perpetuate in the public mind the belief in the heredity of tuberculosis. Emanuel does not deny that both heredity and infection may play their respective rôles in the spread of consumption, but tuberculosis is so prevalent that any hereditary tendency to it falls into

comparative insignificance. From the practical point of view, it is the various paths of infection that are of importance. He discusses the two doctrines and points out that, while the evidence in favor of infection is very strong, the scientific proof of heredity is well nigh impossible. It would require the records of many families in which several children of tuberculous parents had succumbed to tuberculosis in spite of early removal from their parents and early separation from one another, without possibility of exposure to other sources of infection. The results of experiments in guinea-pigs and of observations in orphan asylums where children are separated from an infected environment, give no support to the hereditary doctrine. He discusses infection through marriage, and through the dwelling, infection of fellow-laborers, through nursing, infection of health resorts, the influence of age and sex, bacillary transmission, latent tuberculosis, and hereditary predisposition, and concludes by stating that heredity can not explain (1) cases of phthisis occurring in the same family and obviously spreading from one member to another; (2) cases of phthisis conveyed from husband to wife and *vice versa*; (3) the prevalence of phthisis among the overcrowded poor; (4) the greater prevalence of phthisis among in-door as opposed to out-door employes; (5) cases of phthisis occurring among individuals brought into close contact by their daily avocations, in the home, office, workshop or factory; (6) the prevalence of phthisis among those engaged in tending consumptives; (7) the appearance of phthisis in places now used as health resorts, previously immune from the disease; (8) the mortality from tuberculosis gradually diminishing from infancy to 10 to 15 years and subsequently rising to a maximum at 45 to 55 years.

11. X-Ray in Ringworm.—Macleod's experience since 1905 has led him to the belief that:

1. The x-ray treatment of ringworm by the single dosage method, with the dosage regulated by the pastille, is practically safe and harmless.
2. It is a method of treatment of such delicacy that, even in the hands of an experienced operator, an accident such as an over-exposure might happen; but such accidents should be of such extreme rarity as not to discredit a mode of treatment possessing such obvious advantages.
3. Severe dermatitis followed by permanent baldness is the result of an over-exposure or is due to some accident, such as the exposing of an area the resistance of which has been lowered by the previous application of strong irritants before the inflammation has entirely subsided, or from overlapping.
4. Permanent baldness or delayed hair growth without marked dermatitis is the result of over-exposure, but it might, in rare instances, be due to some idiosyncrasy on the part of the patient, in the same way as the occurrence of alopecia areata after ringworm.
5. Macleod has been unable to obtain any definite evidence of injury to the brain by this method of treatment from his own cases, from the literature on the subject, or from anyone with experience of this treatment whom he has asked, and the experiments which he has done in this connection strongly negative the possibility.

12. Rheumatic Endocarditis.—Coombs states that the reaction to rheumatic invasion of the endocardium is characterized by the formation of large fibroblasts in groups and zones, which, so far as his experience goes, are constant in rheumatic, but absent from other, forms of endocarditis. The valvular inflammation of rheumatic carditis is set up, he asserts, by micro-organisms carried to the endocardium by the coronary arteries and their branches.

13. X-Ray in Ringworm of the Scalp.—Adamson describes the details of a simplified technic, the essential points in which are irradiation at right angles to the direction of the irradiation of adjacent areas, and to aim not at a point in the center of the vertex, of the lower occiput, or of the sides of the scalp, but toward the outer margin of these areas, so that half the dose goes on to the scalp and half on to the shield protecting the face and neck. If these precautions are taken there is no risk of over-exposure at the overlapping margins of the rayed areas. In practice the dosage works out so nicely, that every part receives an equal amount and depilation is total and complete, without anywhere a sign of over or under exposure. In theory, according to the well-known laws that the quantity of rays received at any point exposed varies (1) inversely with the square of the distance from the source; and (2) directly with the size of the angle of incidence, the dose received by any part of the scalp is found to be with mathematical accuracy, one pastille dose.

Medical Press and Circular, London

May 12

- 21 *Alcoholic Insanity*. J. O. Donelan.
 22 *Rupture of the Uterus During Labor*. T. B. Grimsdale.
 23 **Ought Tea, Coffee, and Chocolate to be Forbidden in Uricemia?*
 A. Martinet.
 24 *Disinfection of Houses in India*. S. C. Hormusjee.

23. Coffee, Tea, etc., in Uricemia.—Martinet concludes that:

1. Alkaloidal beverages, especially tea, coffee and chocolate, should be forbidden for uricemia subjects, especially those whose urine spontaneously precipitates uric acid.
2. Nevertheless, the action of coffee and chocolate appears to be less injurious to the organism than that of meat and the legumens, the latter appearing to predominate; for although uricemia manifestations are especially frequent in meat-eating races or tea drinkers (Anglo-Saxons), they seem to be rather rare in people who are vegetarians, even though they drink tea and coffee (Japanese, Hindus, Arabs, etc.).

In short, tea, coffee and chocolate may be allowed in moderation when the food is principally vegetarian and hypopurinic; but they should be strictly forbidden when the diet comprises much meat, which is the case in most instances of "excretors of uric acid."

Clinical Journal, London

May 12

- 25 *Hemianesthesia of the Dissociated Form*. W. P. Herringham.
 26 *Fistula and Diseases of the Rectum*. L. Mummery.
 27 **Pernicious Anemia (concluded)*. H. French.

27. Pernicious Anemia.—French concludes his article, begun in the last issue. The points he has sought to bring out are:

1. Slight evening pyrexia is seldom absent in pernicious anemia cases that are decidedly ill.
 2. Pigmentation within the month, of precisely similar character to that seen in Addison's disease, may occur in pernicious anemia cases treated with arsenic.
 3. The spleen is to be felt in about one-third of the cases, and is really enlarged.
 4. The nerve symptoms are not at all uncommon in pernicious anemia.
 5. The color index of the blood, though typically higher than when an advanced stage of the disease has been reached, is not always or continually high especially during a period of improvement in the patient's condition, when it may be actually low.
- Lastly, pernicious anemia, as we know it, is very possibly only a late and almost incurable stage of a disease that it is to be hoped will some day be recognizable early enough to be cured.

Intercolonial Medical Journal of Australasia, Melbourne

March

- 28 **Syphilis*. H. B. Allen.
 29 **Frequency and Intensity of Congenital Syphilitic Infection in Children*. P. B. Bennie.
 30 *Syphilis and Nervous Disease*. A. Davidson.
 31 *Treatment of Syphilis*. W. McMurray.
 32 *The Larynx and Early Diagnosis of Phthisis*. W. K. Hughes.
 33 *Idem*. S. W. Ferguson.
 34 *Tuberculous Glands Treated by X-Rays*. T. G. Beckett.
 35 *Radium Treatment*. H. Lawrence.

28. *Syphilis*.—Allen says that the time-honored diagnostics of syphilis leave much to be desired. The great marks of syphilis are in the arterial wall, to which the spirochetes soon betake themselves in experimental syphilis. Allen sets forth the following conclusions concerning syphilis and the circulatory system: First, aortic aneurism, in the great majority of cases, is due to syphilis, and aneurism is very prevalent in Victoria, and very markedly prevalent among women, so that in 1906 there were 31 deaths recorded from aneurism in women, as against 57 deaths in men. Second, aortic regurgitation is mainly due to syphilis, either through chronic endocarditis or atheroma, or a combination of these conditions. Third, a large proportion of cases of mitral obstruction must be attributed to syphilis. Fourth, syphilis frequently induces thickening of the fibrous rings at the bases of the valves. Fifth, subject to unimportant exceptions progressive chronic myocarditis is a syphilitic affection. Sixth, syphilis is a potent cause of coronary atheroma, and thus contributes to the gravity of many cases of angina, or leads to myomalacia and rupture of the heart; while syphilitic arteritis at the mouths of the coronary arteries often causes cardiac ischemia, claudication and syncope. Apart from dust disease and chronic tubercle, syphilis is the great cause of interstitial pneumonia. The multiple fibroses of serous membranes often ascribed to tubercle are, in Allen's experience, more frequently due to syphilis. Surgeons have to bear in mind syphilitic arteritis and thrombosis, not only in senile gangrene, but in the necro-

ses of young people, in Raynaud's disease, and superior mesenteric thrombosis. A chronic syphilitic inflammation is often the forerunner of a true malignant growth. The obstetrician needs to know the signs of syphilis in the umbilical cord and placenta. In the cord, the blood vessel walls are thickened and sclerosed, and in the fresh section white fibrillar tissue spreads from the thickened vessels into Wharton's jelly. The two arteries are constantly affected. In the placenta there may be opaque white patches in the surface membrane, with subjacent fibrosis. Gummata are sometimes found. The mother is always infected, though she may show no outward sign of the disease. The gynecologist must reckon with gummata in the cervix and upper vagina, and with slower forms of ulceration and fibrosis, chronic metritis, salpingitis and mastitis, in all of which syphilis may play a part. Allen is convinced that the main mortality in children from slight causes is due to inherited syphilis, in which precocious atheroma often plays a part. He suggests that the enormous prevalence of fibrosis of organs and sclerosis of arteries in later life, is to be attributed, at least partly, to the evolution of early fibrotic changes. A stringent marriage law for syphilitics, administered with adequate firmness, is urged.

29. *Congenital Syphilis in Children*.—Bennie discusses this question at some length and concludes that if either parent has ever had syphilis, no matter how well treated, there is a syphilitic taint in the child subsequently born. Fully 10 per cent. of the children are infected, and this small percentage affords material for more than half the pediatric work and includes nearly half of the fatal cases. Speaking generally, the chances of death before puberty are nearly seven times greater for the syphilitic than for the non-syphilitic. Infected children should, if possible, be treated in all illnesses for the syphilitic factor. A course of antisyphilitic treatment should precede operation on congenital syphilitics.

Annales de Médecine et Chirurgie Infantiles, Paris

April 15, XIII, No. 8, pp. 253-288

- 36 **Milk of One Cow versus Mixed Milk for Infant Feeding*. (Lait individuel ou lait de mélange.) E. Gaujoux.
 37 **Prophylaxis and Physiotherapy of Tuberculosis in Children*. H. Keller.

36. *Milk of One Cow Versus Mixed Milk in Infant Feeding*.—Gaujoux thinks that there is no advantage in using the milk of one cow rather than the mixed milk unless that one cow is kept apart from the others under specially favorable conditions and constant supervision of its food, physical condition and physiologic functions, after eliminating tuberculosis with the tuberculin test.

37. *Prophylaxis of Tuberculosis in Children*.—Keller declares that country air and hygienic surroundings are required by the children of the poor in winter even more than in summer, as the children are housed more and the hours of sunlight are fewer. Well-located and well-conducted sanatoria for children, both of well-to-do and of poor families, would prove invaluable to promote hygiene, discipline and order and teach the children how to ward off disease. Such a sanatorium is the best school for both the tuberculous and the predisposed. He emphasizes the fact that prophylaxis of tuberculosis in the young will reduce its frequency in adults, and that measures to eradicate alcoholism will do away with its most prolific source.

Archives Générales de Médecine, Paris

April, CC, No. 4, pp. 193-256

- 38 *Accidental Subcutaneous Emphysema in Two Cases of Valve Pneumothorax a Compensating Process*. (Rôle compensateur de l'emphysème sous-cutané accidentel, dans deux cas de pneumothorax à soupape; obligation de ne pas compter sur cet effet favorable.) M. Perrin.
 39 **Perforation of the Esophagus*. M. Cléret.
 40 **Electric Sterilization of the Air*. A. Sartory.

39. *Perforation of the Esophagus*.—In the case described, a cancer in the esophagus was unsuspected until perforation occurred. The eccentric rather than the concentric development of the lesion prevented disturbances in the passage of the food into the stomach. The patient was a man of 45 with a history of early syphilis and excessive use of liquor, but robust

until recently, when symptoms of dyspepsia disturbed him for a time, recurring twice. After an interval of three months of freedom from symptoms, the pain in the right hypochondrium returned, with anorexia and rapid emaciation, and the perforation in the esophagus revealed the malignant nature of the trouble.

40. **Electric Sterilization of the Air.**—Sartory's apparatus draws in the cold air, heats and brings every molecule in contact with the electricity, passing the air on and out through a kind of chimney at the top of the apparatus. Air thus treated is rapidly sterilized, three hours being sufficient to sterilize completely the air in a room containing 150 cubic meters of air; from 50,000 the number of bacteria drops to 5,000 in one hour and frequently to zero by the end of the second hour. He relates experiences with this sterilizer in the crowded waiting room of a free public dispensary and in the smaller consultation rooms, the tests showing entire success. Sterilization is complete much sooner in comparison in the smaller rooms.

Presse Médicale, Paris

May 5, XVII, No. 36, pp. 313-320

41 *Chancroidal Processes at the Anus and Anal Canal. (L'ante chancroïdeuse.) P. Ravaut and B. Bord.

May 8, No. 37, pp. 321-336

42 *Buried Protheses in Treatment of Fractures. (Technique et indications de la prothèse perdue dans le traitement des fractures.) A. Lambotte.

43 Specific Antibodies in the Serum in Various Streptococcus Lesions. M. R. Castex.

44 Scoliosis from Malformation of the Vertebrae. P. Desfosses.

41. **Chancroidal Ulceration of the Anus.**—Ravaut and Bord insist that the anal region should be regarded as entirely distinct from the rectum in its response to infection, as well as from the anatomic and histologic standpoints. The gonococcus locates by preference on the rectal mucosa, sparing the anus, while chancroidal infection remains limited to the anal region, causing a special process, the characteristics of which they describe in detail, with four illustrations. Examination is so painful that they use spinal anesthesia for the purpose, injecting merely one drop and a half of a 50 per cent. solution of cocaine hydrochlorate. This solution does not diffuse, but remains limited, inducing analgesia only in the genito-perineal-anal region. The chancroidal ulceration here requires the same treatment as at other points unless defecation is so painful that direct cauterization becomes necessary under spinal anesthesia. If there is a tendency to stenosis, progressive dilatation will soon correct it and may be indicated as a preventive measure.

42. **Buried Protheses for Fractures.**—Lambotte gives a number of illustrations of the small gilt or nickel-plated steel splints which he screws directly on the bone with half a dozen small screws, working through a long incision in the soft parts, as he explains in detail. The method has peculiar advantages for fractures of the forearm or thigh bones. With complete asepsis the prothesis is tolerated indefinitely by the bone tissue. He never touches the screws or plate with his hand, having devised special instruments for the purpose. The wider his experience, the greater his satisfaction with this method of treating certain fractures.

45 *Constitutional Toxic Dyscrasia Responsible for Conditions Known as Neurasthenia and Psychasthenia. Bernheim.

46 *Etiology, Pathogenesis and Treatment of Migraine. L. Jaquet and Jourdanet.

47 *Absence of Argyll-Robertson Sign in Certain Cases of Tabes. J. Heitz and Harachip.

48 Seventy-nine Cases of Paralysis of Recurrent Nerve. (Pathogénie et importance sémiologique de la paralysie récurrentielle.) E. Guder and R. Dufour.

49 Psychic Disturbances in Parathyroid Syndromes. Laignel-Lavastine.

50 Functional Disturbances and Dissociations with Abnormal Thyroid Functioning. (Discordances et dissociations fonctionnelles dans l'évolution morbide des états thyroïdiens.) G. Sardou.

45. **Toxic Dyscrasia Responsible for Neurasthenia and Psychasthenia.**—Bernheim has applied suggestion extensively during the last quarter century in the conditions known as neurasthenia, psychasthenia and psychoneurasthenia, and this

experience has shown that there are two well-defined forms of neurasthenia which differ little except in their response to suggestion. One form occurs after overwork and emotional and nervous strain, and such patients are easily cured by distractions and suggestion. The other form is the result of the action of some toxin or toxins circulating in the blood, with special affinity for certain tracts in the nervous system. This true neurasthenia is dependent on some organic or toxic disturbance, frequently revealed by the exaggeration of the tendon reflexes. Neurasthenia apparently purely functional may be the precursor of some permanent spinal affection, judging from experiences in his own practice. In three recent cases of intense neurasthenia the patients displayed a tendency to fall over backward when they stood up or tried to walk. This symptom indicates some organic or toxic localization in the cerebellum, confirming his assumption that psychoneurasthenia is not an imaginary affection nor autosuggestion nor a psychoneurosis, but has a toxic-infectious basis, generally some constitutional autotoxic dyscrasia grafted on an inherited diathesis, which may be roused to activity by some emotional or traumatic shock or physiologic strain or casual infection, especially influenza. Suggestion aids the functional elements in the syndrome, but is powerless against the underlying dyscrasia of the nervous system.

46. **Migraine.**—Jaquet and Jourdanet ascribe migraine to too rapid eating in the majority of cases, although in others the liver, the menses, mental strain or eye defects may be responsible. The main point in treatment is to make the patients eat in a more leisurely manner. It is difficult to enforce this, as old habits must be modified, but it is the only certain means of cure. Reading at table must be forbidden, and the patient must have a watch beside his plate. Migraine, they think, is a crisis of objective hyperesthesia of the brain substance, especially of the cortex, with variable nervous radiations, all under the dependence of stimuli emanating from various organs, chiefly from the stomach irritated by imperfectly masticated food swallowed in too short a time, inducing overfunctioning. He summarizes the details of a large number of cases which sustain this conception and which illustrate the prompt benefit derived from treatment based thereon.

47. **Pupil Reaction to Light Retained in Tabes.**—Heitz and Harachip state that 15 out of 48 tabetic patients showed some response to the action of light on the pupil. In some the response was practically normal. The Argyll-Robertson sign was also absent in nearly the same proportion in 29 cases in another hospital group and in 12 of 33 in general practice. The persistence of the pupil reaction was evidently due to some special localization of the lesions in the meninges.

57 Negative Action of Fibrolysin on Scar Tissue. (Experimentelle Untersuchungen über die Wirkung des Fibrolysin auf das Narbengewebe.) W. Brandenburg.

51. **Operations on the Biliary Passages.**—Körte analyzes his experiences during the last five years, summarizing forty of the more interesting operations. He does not attempt to operate in case of carcinoma of the pancreas when sure of the diagnosis. One patient has been cured for nearly four years since removal of a carcinoma of the outer end of the common bile duct. The small tumor obstructed the passage of bile. It was removed at an early stage, before the obstructive jaundice had lasted long enough to debilitate the patient, a woman of 47.

52. **Location of the Appendix.**—Liertz gives illustrations of a number of interesting findings in regard to the appendix

observed in the course of 2,002 autopsies or at appendicectomies, including some from the literature. The position of the appendix in the fetus and in children, the origin and length, and the relations of the appendix with other organs are discussed in detail, with illustrations.

53. Unusual Gallstone Operations.—Kehr presents and discusses 59 of the more notable operations on the biliary system in the 200 he has performed in the last two years, although he admits that he did not learn anything essentially new from them.

55. Imperforate Anus.—Ziemendorff describes a case and reviews 114 which he has found in the literature. He comments on the strange fact that the prognosis has grown graver of late years, and also that rebellious constipation is a frequent sequel even when the trouble has been removed by effectual operation and stenosis or cicatricial obstruction has not developed later. The best results have been obtained with what he calls proctoplastic operations, but these require great perseverance, extensive mobilization of the intestine and careful suture to the skin. The results are good and permanent if other circumstances beyond control do not annul the results, which only too often happens. The 114 cases are tabulated under twenty-four headings. Proctoplastic operations for atresia of anus, rectum, methra and vagina show a mortality of 26.9 per cent. for 78 cases and of 40 per cent in 45 cases of atresia of the anus or rectum alone, while the mortality was 58.8 per cent. in the 17 cases with fistula. Colostomy has a record of 79.3 per cent. mortality in 29 cases, and simple puncture or incision of 28.6 per cent. in 7 cases. These statistics apply to the mortality during or soon after the operation. In 29 cases of atresia under observation for three months at least, 55.2 per cent. of the patients were free from disturbances, 17.2 per cent. still had some slight trouble, and 10.3 per cent. had died. The ultimate outcome is probably still more disappointing; the infant's peritoneum does not heal readily and the child's crying and restlessness interferes with the healing of the sutured wound or bursts it; such operations thus having a less favorable prognosis in infants than in adults.

56. Congenital Fistula or Channel in Sacral Region.—Klemm regards the congenital dimple or hole reaching inward toward the sacrum as a tubular dermoid, and reports five cases in which this congenital cavity became infected, with abscess formation, the constantly recurring disturbances finally necessitating excision of the parts involved. In one of these cases the trouble was an actual cystoid dermoid tumor with a system of fistulas, a multitubular dermoid. In another multitubular dermoid the cystoid growth sent out processes on each side, displaying active postembryonal growth. The excision should always extend down to the bone to ensure removal of all the dermoid tissue.

58 *Internal Measures for Arresting Hemorrhage, especially in Hemophilia (Die neueren innerlichen Blutstillungsmethoden, vorzüglich bei Hamophilie, mit besonderer Berücksichtigung der Verwendung von Serum) K Wirth. Commenced in No 5

58. Serum Treatment of Hemorrhage.—Wirth has found 45 articles on the subject of the internal methods of hemostasis. He reviews them all, with special regard to the use of serum in hemophilia. His analysis shows that the results of gelatin, calcium, strontium and ovarian and other organ therapy have been disappointing, although an occasional success has been realized. Far better results have been obtained with subcutaneous or intravenous injection of fresh animal serum, the method inaugurated by Weil; although Bienwald in 1897 reported the arrest of hemophilic hemorrhage by local application of normal human blood. He drew some blood from the child's grandmother and filled the traumatic wound in the left temple with the blood as a last resort. The foreign blood coagulated in the wound and the hemorrhage was arrested. Twenty cases have been published in which injection of serum arrested hemophilic hemorrhage more or less completely. To

date only two cases have been reported in which no benefit was derived (Bonzani and Maclaur). The effect of the serum does not last over a month. The local action of the serum is also considerable, sometimes rendering repetition of the injections unnecessary. Wirth has had considerable experience with this treatment, which he reports in detail. One patient was a boy of 14, known to be hemophilic, with persisting hemorrhage from the nose, throat and gums, which stopped under application of diphtheria antitoxin locally and injections of from 15 to 20 c.c. No by-effects were observed, and the hemorrhagic tendency was kept under complete control by further injections, once a month, for six months. In another case a hemophilic girl of 15 with metrorrhagia and epistaxis was injected with horse serum and the uterus and vagina were tamponed with gauze dipped in normal serum, with prompt benefit. He has thus treated twenty-three patients with hemorrhage from various causes, and is convinced that the injections of serum are actually an efficient means for treatment of hemorrhage. This method of treatment is indicated above all in affections in which the coagulating power of the blood is reduced, although it may prove effectual in other forms of hemorrhage. As a rule, 20 c.c. of serum is enough, but 40 c.c. may be injected without harm. No disturbances were observed in his cases, not even when the injections were repeated. The subcutaneous route should be preferred unless the intravenous is urgently required. Horse serum seems preferable, and ordinary diphtheria antitoxin can be used, selecting the vials with the latest date, and applying the serum also locally to the bleeding spot. He calls attention especially to the subsidence of skin and mucous membrane hemorrhages in a case of cholemia with advanced cirrhosis of the liver. One new-born infant, bleeding freely from nose and mouth, was treated by local application of sponges dipped in horse serum, which rapidly controlled the hemorrhage. In some cases hemorrhages in the lower part of the bowel or from hemorrhoids were arrested by injection of 10 c.c. of beef or horse serum into the bowel.

63. Influence of Ingestion of Salt on Nephritic Edema.—Blocker gives the metabolic findings in six cases of nephritis showing that the edema in such cases is only rarely the result of primary retention of salt. In one case copious intake of salt seemed to do harm, but in several cases restriction of salt did not show the least influence on the dropsy, while diarrhea and sweating gave great benefit. Only one patient showed a favorable effect from the salt-free diet, but this one success should encourage its adoption among other therapeutic measures. Other procedures are generally equally effectual; when these fail, the salt-free diet generally fails too. Besides this, the salt-free diet is generally repugnant to the patients. It should never be ordered until the conditions in regard to the elimination of salt have been determined. He adds that the same purpose is accomplished with milk, weak tea, coffee and cocoa, rice and cereals, without inflicting too great privations.

on the patients. Only when they weary of a milk diet and it is known that salt is harmful, should the strict Vidal diet be instituted. Blooker treats patients with bed rest and exclusive milk diet in the parenchymatous form of nephritis, allowing the ordinary diet in the interstitial form, with diuretics and heart tonics as needed. If the dropsy does not subside, he gives 10 gm. of salt every day for a few days and watches the weight. If the weight increases, a salt-free diet should be ordered. If not, he pays no further attention to the salt in the food, but tries what diaphoresis or catharsis will accomplish. Different diuretics should be given a trial, as one may succeed when others fail. If the edema requires tapping, this should be done without hesitation. Copious ingestion of fluids caused no disturbance in most of his patients, but he advises not to go above two liters a day.

65. Pathologic Anatomy of Mitral Defects.—Schabert expatiates on the valuable retrospective information to be derived from combining the test of pouring water through the mitral valve with determination of the absolute and relative weight of the ventricle in relation to the other parts of the heart. In his autopsies in 11 cases of pure mitral stenosis, 6 of the subjects were over 50 years old. In 9 cases of mitral insufficiency, pure or combined, none of the subjects had reached the age of 50. The stenosis seems to be the terminal phase of the insufficiency. He was surprised at the number of cases of pure stenosis encountered and the long survival. With pure mitral insufficiency there is always hypertrophy of the left ventricle, determined most readily by weighing the different parts of the heart separately.

67. Influence of Alcohol on the Blood Pressure.—In the research reported, 956 measurements of the blood pressure in 62 patients were taken before and after ingestion of alcohol. The results are tabulated, the general conclusion being that alcohol should be given sparingly in pathologic conditions.

71. Relations Between "Lymphatism" and Scrofula.—Moro was surprised to find that in a number of cases of pronounced lymphatism, resembling scrofula in every respect, the tuberculin reaction was negative. He has further investigated the previous history in fifty cases of scrofula giving a positive reaction. From the facts observed he is convinced that what we call "lymphatism" is a constitutional condition, and, if tuberculous infection is superposed, the result is scrofula. The latter does not develop without the "lymphatic" soil, and the tuberculin test is sometimes the only means to distinguish between lymphatism and scrofula. The distinguishing feature of the lymphatic constitution is the exceptional tendency to inflammatory reactions of an obstinate and recurring nature, in which the lymphatic tissue takes the most prominent part, primarily or secondarily. All this is found in scrofula, but it is not the result of the tuberculous infection. Such children are peculiarly sensitive to tuberculosis and after infection are exceptionally sensitive to the tuberculin test.

73. Non-Tuberculous Induration of the Apex with Impeded Breathing.—Richter warns that mouth breathers are liable to develop a simple, non-tuberculous "collapse induration" in the apex of the right lung which simulates a tuberculous process,

although it is merely the result of insufficient respiration. Normal conditions are liable to be restored when the adenoid growths or other obstructions are removed. It is especially important to differentiate this condition so that these patients will not be sent to sanatoria where they are liable to acquire a superposed tuberculous infection. Blümel declares that fully 5 per cent. of the 1,700 patients at the Görbersdorf sanatorium in the last few years were sent there by mistake as the apical lesions were not tuberculous.

76. Mercuric Oxycyanid Internally in Syphilis.—Schulte has used this drug exclusively for internal treatment of syphilis in the last twelve years. He orders 100 pills from 0.5 gm. (7.5 grains) of the oxycyanid in licorice powder, 2 pills 3 times a day, only after eating. He has never seen any disturbances from this drug, given at least in 1,000 cases, except that stomatitis is liable to develop if the mouth is not taken care of. He cites four typical cases to show the prompt and invariable benefit, and urges others to try the oxycyanid.

- 80 *Clinical Importance of Elimination of Phosphorus in Urine of Breast-fed Infants. (Phosphorausscheidung im Harn beim Brustkind.) L. Moll. Commenced in No. 3.

77. Diphtheria in the Schools.—Schultze relates experiences and presents arguments to sustain his view that when a case of diphtheria develops among the children of a certain room in school, all the children in the room should be examined bacteriologically for diphtheria bacilli, or at least those who have been having sore throat. Positive findings should exclude the child from school but he should be allowed to return if two more bacteriologic examinations give negative findings. If the child keeps well for four weeks, or six weeks at longest, he should be allowed to return to school, notwithstanding positive bacteriologic findings, but should be given a seat apart from the other children. If anything develops suggesting that he is the source of new infection he should be excluded from the school again. By this supervision and control of the known and suspicious cases of diphtheria, it is possible to stamp out effectually all incipient epidemics.

78. Mushroom Poisoning.—Lövegren reports the postmortem findings in a case of poisoning from the mushroom, *Gyromitra s. Helvella esculenta*, which is not usually considered poisonous. Several members of the family were made ill by eating the mushrooms and a little girl died within twenty-four hours. The kidneys showed microscopic changes similar to those observed in nephritis after diphtheria.

79. Paralysis After Trauma During Delivery.—Gött reports three cases of paralysis in children who had been delivered by traction on the feet. The vertebrae seem to be able to stand traction without injury, but the spinal cord suffers as blood vessels are liable to be lacerated. Such hemorrhages generally soon prove fatal, but, if not, flaccid paralysis develops with complete atrophy of the muscles most involved and extensive sensory disturbances, absence of the reflexes, bladder disturbances and sometimes respiratory anomalies. The children generally succumb to colicystitis. The principal feature of this form of paralysis is the thickening of the meninges consequent on the hemorrhage, causing compression of the roots of the nerves passing to the lower half of the body.

80. Importance of Elimination of Phosphorus in the Urine of Infants.—Moll ascribes great importance to the phosphorus content of the urine, the large proportion eliminated in disease and its subsidence during convalescence. The tolerance for food can be determined from the urine phosphorus findings which are thus a reliable index for the diet. As the proportion of phosphates declines, the clinical picture improves. In acute gastroenteritis if the proportion of phosphates in the urine is not materially reduced by a day or two of fasting, the prognosis is bad. He is convinced that the presence of organic phosphorus in the urine of breast-fed

fifteen days, as ordered, but by mistake she took at one dose in the morning the entire daily dose which should have been fractioned and taken after meals. She commenced to lose weight at once and the goiter also subsided, but symptoms of exophthalmic goiter developed with a recurrence of an old knee affection and crural adenitis and the goiter returned to its former size. In the course of several months these symptoms gradually subsided and the patient is now comparatively well. The second patient had arthritis, a cardiac defect and asthma, in addition to the goiter and considerable obesity. Potassium iodid was given tentatively but the patient rapidly lost weight and the heart symptoms grew more pronounced although the asthma vanished, and tremor was observed. No change was apparent in the goiter and the iodid treatment was soon suspended, but the symptoms and general malaise persisted for several months. He accepts a special susceptibility in these cases to the action of the iodid and calls attention to the onset of symptoms suggesting hyperfunctioning of the thyroid even while it was rapidly subsiding in size. This throws light on the cases of exophthalmic goiter without enlargement of the thyroid, and illustrates that the hyperfunctioning of an organ is not necessarily accompanied by unusual size.

119. **Nervous Symptoms with Ankylostomiasis.**—Signorelli reports three cases in which hookworm disease was accompanied by a meningeal, a neuralgiform or a convulsive, epileptiform syndrome. The patients were, respectively, 10, 17, and 23 years old.

121. **Primary Actinomycosis in Salivary Glands.**—In one of the two cases reported by Söderlund, a scrap of a head of barley was found sticking in the tissue of the sublingual gland, the outer end in one of its excretory ducts. The patients were a woman of 65 and a boy of 10, and in both the small hard tumor had developed in the course of a month or two. It was ascribed to a tuberculous origin in one case until after excision and microscopic examination.

123. **Method of Curing Rectal Prolapse in Children Without the Knife.**—Ekehorn passes a needle through the soft parts, at one side of the sacrum, until the tip emerges in the rectum where the operator's other hand threads the needle with a piece of stout silk suture material. This end of the silk is then drawn back and out, and the needle is introduced again in the same way on the other side of the sacrum, where it is threaded with the other end of the silk gut which is drawn out in the same way and the two ends are tied together over the sacrum. This brings the rectum up against the sacrum and as adhesions form the tendency to prolapse is permanently corrected without any cutting operation. In the four cases reported, the silk was removed after two weeks; the patients were between 2 and 5 years old, and there has been no sign of recurrence in any instance. It is not necessary to keep the patients in bed after this simple procedure.

VOLUME LII

CHICAGO, ILLINOIS, JUNE 19, 1909

NUMBER 25

Addresses

THE CONQUEST OF THE TROPICS FOR THE WHITE RACE

PRESIDENT'S ADDRESS AT THE SIXTIETH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION,
AT ATLANTIC CITY, JUNE 9, 1909

W. C. GORGAS, M.D.
PANAMA, CANAL ZONE

It has been customary for the incoming President to urge on the Association some lines of action which he deems particularly useful and important. After careful thought, however, I have concluded that no special recommendations from me are needed at this time, and that a discussion of some phases of our sanitary work at Panama would be appropriate and perhaps generally useful and interesting.

This Association has recently endeavored to influence legislation in a direction favorable to sanitation; there is a broad field for usefulness in this line. With your permission, then, I will depart from the accepted custom, and will address you with regard to the sanitary work at Panama as it bears on malaria. I have thought that a brief description of this work might be of value to you in the future conduct of antimalarial work elsewhere.

Before entering on my subject, however, I wish to state that Dr. S. Weir Mitchell, of Philadelphia, has suggested that our Association should erect in the national capital some suitable monument in memory of the medical officers on both sides who lost their lives in the performance of their duties during the war between the states. Our Association now represents the medical profession of the whole United States. No period in the history of our profession can be selected in which greater devotion to duty was shown than was evidenced by the medical officers who served in this war, nor can any war be pointed out in which a greater number of medical officers gave up their lives in performance of their duties. I therefore recommend that the Association take steps looking to the erection in the national capital of a suitable monument in memory of the medical officers on both sides who gave up their lives in the performance of duty during the war between the states.

It has been proved that malaria is carried from person to person by the bite of the female of a particular species of mosquito, namely, the anopheles; and we hold that it is conveyed in practically no other way. Our sanitary measures are, therefore, directed toward the destruction of this species of mosquito. The female anopheles lays her eggs (about 100 at a time) on the surface of fresh water in which grass and algae are abundant. These eggs float around until hatched by the sun's heat, and the young larvae flee to the grass and algae for protection

from small fish and other natural enemies. After larval and pupal stages in the water lasting about eight days, they develop into full-grown mosquitoes. The adult anopheles is weak in flight and does not habitually move about much; probably one hundred yards is practically its ordinary flight. The adult avoids the wind and seeks for its protection undergrowth, grass and plants near the ground.

Our measures for mosquito destruction are, then, based on the peculiarities just described. We destroy all the breeding-places within one hundred yards of the locality we desire to protect, so that the mosquito can find no water in which to lay her eggs, or in which her larvae can develop. At the same time we clear off the brush within the same area, so that the adult can not secure protection against the wind.

The methods used for the destruction of breeding-places must vary with the locality. Wherever we can drain at reasonable cost, we do so, usually with superficial ditches, or with subsoil tiling. Subsoil tiling makes the ideal antimalarial drainage system; it does away entirely with mosquito-breeding, and, after it is once laid in, no further expenditure is necessary in keeping the ditch open. In the tropics the growth of vegetation is so rapid that a superficial ditch has to be cleaned out every two weeks to keep the channel free from breeding-places. This is a very heavy expense, and we, therefore, find it more economical to concrete all superficial ditches. A concrete ditch should be swept out frequently, else obstructions will form many small pools.

Drainage is, *par excellence*, the means for anopheles destruction, but in many cases, by reason of the expense, it can not be resorted to; as, for instance, where a town is situated near a large swamp or lake. In such cases the larvae can live only around the edges of the water, where they are protected by grass and algae from small fish, or in holes made by the feet of animals in the soft soil along the margins of the water. We, therefore, keep the brush and grass cut there, and see that no animals have access. Where a town is situated near the banks of a small stream, we keep the banks and the stream itself free from grass and algae.

When it can be done with safety, sulphate of copper is used for killing algae. When this can not be used, we kill the larvae with crude petroleum, or phinotas oil. Petroleum destroys the larvae by spreading over the surface of the water and smothering them, while phinotas oil acts as a direct poison. These are the chief methods for destroying larvae; and I look on their destruction, next to efficient drainage and the clearing away of vegetation, as the principal means for controlling malaria.

Brush-cutting we regard as second only to drainage in importance as an antimalarial measure. If brush and grass are thick about a dwelling, mosquitoes seek them

as shelter from the wind, and, if continuous stretches exist, the anopheles will wander by short flights a mile or more from a breeding-place. A cleared space of a hundred yards will, as a rule, stop her flight.

We keep the brush and grass cut within a hundred yards of the point to be protected. This is a large item of expense, as both grow very rapidly at Panama. It is a great economy to get the ground in such condition, preferably by subsoil tiling, that horse-mowers and scythes can be employed. They are now in use in most of the localities along the line of the canal where work has been going on for a year or more.

A specially good example of the results that can be attained by antimalarial work is afforded by our experience at Colon. This is a town of 15,000 inhabitants, and is built on an island just above sea-level. Where the ground has not been filled in, the houses have to be placed on piles from two to four feet in height, and are approached by wooden footways raised above the water. The heavy rains in the wet season convert this unfilled ground into a fresh-water swamp. Mosquitoes of every kind were very numerous in Colon when sanitary work was begun there.

The brush was first cut away for half a mile back of the town; this cleared area was intersected by small canals twenty feet wide and six feet deep, and the entire swamp was connected with these canals by surface ditches. This allowed the fresh water to run off, and the incoming tide caused all ditches to be filled daily with sea-water. We also looked carefully after all water-containers in the town, including cisterns and barrels.

The result has been that Colon is now almost free from mosquitoes of all kinds. This was unexpected. It was hoped by our sanitary measures to get rid of the disease-carrying mosquitoes, namely, the stegomyia and anopheles, which do not fly far; but it was not expected that the culex variety, which is strong on the wing, would be affected to any great extent.

In addition to measures directed toward the destruction of mosquitoes, the houses of all employes on the Isthmus are screened with wire gauze. Most of the houses are built with galleries, on which the doors and galleries open. These galleries are screened rather than the doors and windows themselves, thus leaving only one or two entrances into each house to be looked after with regard to being kept closed. The screening should always be supervised by some one experienced in mosquito work, as there are many points which will be overlooked by the average carpenter.

We also recommend the use of mosquito-bars, though most of us have become somewhat careless on this point, as mosquitoes are rare in houses which are carefully screened in the well-drained districts.

All employes are also urged to take three grains of quinin daily as a prophylactic measure. They are not required to do so, but the dispensers visit all the camps and barracks daily and offer quinin to such men as care to take it. On an average, our 45,000 employes consume daily about 20,000 doses of quinin.

To carry our sanitary measures into effect, the forty-five miles of country lying along the line of the canal are divided into seventeen districts. The sanitary work of each separate district is in charge of an inspector, and one chief inspector has charge over all. The chief inspector has on his staff a man familiar with the life-history of the mosquito; another who is an expert in tiling and ditching, and also a general inspector. These men keep in touch with the district inspectors and act

as their instructors. The district inspector is held responsible for the results in his district. He has twenty-five or thirty men for ditching and brush-cutting; a force of carpenters for keeping screens in repair, and one or two quinin dispensers.

The chief inspector keeps in such touch with the various districts that he can intelligently apportion to each the funds at his disposal, increasing or decreasing the monthly allowance as the necessity arises. Each district inspector is notified monthly of this allowance, and is required to keep his expenditures within the prescribed limit.

The medical officer in each district reports weekly the number and locality of the employes in his district suffering from malaria. These reports are consolidated every week in the central office, giving for each district the number of employes in that district, the number of cases of malaria which occurred during the week among these employes, and what percentage the number of cases of malaria bears to the whole number of employes. A copy of this consolidated report is sent weekly to each district inspector. The work of the district inspector is judged by this report. If the malarial rate rises in a district the special inspectors from the central office go out to the district and they, with the district inspector are expected to find the cause of the rise and to correct it.

The results as to malaria have so far been very satisfactory at Panama. Table 1 shows the malarial rate among employes:

TABLE 1.—MALARIAL RATE AT PANAMA						
Year.	Force.	Cases.	Rate per 1,000	Deaths.	Rate per 1,000	
1905	16,511	8,496	514	92	5.57	
1906	26,705	21,938	821	199	7.45	
1907	39,344	16,709	424	138	3.51	
1908	43,890	12,372	282	59	1.34	

It will be seen from this table that there has been a steady decrease in the malarial rate and that at present it is less than one-fourth of what it was in 1905. I see no reason why the rate should not continue to decrease indefinitely, provided proper methods are kept up.

The general health of our force is excellent. Considering the whole population under our sanitary jurisdiction, including the cities of Panama and Colon, our results are shown in Table 2.

TABLE 2.—DEATH RATE IN THE POPULATION UNDER AMERICAN SANITARY JURISDICTION				
Year.	Population.	Number of Deaths.	Rate per 1,000.	
1905	42,699	2,793	65.41	
1906	66,011	3,544	53.69	
1907	102,133	3,435	33.63	
1908	120,097	2,983	24.83	

In the Canal Zone, which, for sanitary purposes, is under the supervision of the chief sanitary inspector, the rates for the last two years were as shown in Table 3.

TABLE 3.—DEATH RATE IN CANAL ZONE				
Year.	Population.	Number of Deaths.	Rate per 1,000.	
1907	54,306	1,708	31.60	
1908	67,146	1,273	18.95	

While this is not small as compared with most parts of the United States, it is small for tropical regions and small as compared with many parts of Europe.

Table 4 shows the death rate from all causes (including violence), considering the whole force of employes.

TABLE 4.—DEATH RATE AMONG GOVERNMENT EMPLOYEES				
Year.	Force.	Number of Deaths.	Rate per 1,000	
1905	16,511	427	25.86	
1906	26,705	1,105	41.37	
1907	39,343	1,132	28.77	
1908	43,890	571	13.01	

The rate for 1908 is probably not any higher than that of a similar body of men doing the same work in New York State.

The figures for Americans, taking into account all causes, including violence, are shown in Table 5.

TABLE 5.—DEATH RATE FOR AMERICANS IN PANAMA

Year.	No. of Men.	Deaths.	Rate.	No. of Women and Children.	Deaths.	Rate.
1905	3,029	35	7.00	800	11	13.75
1906	5,000	35	7.00	800	11	13.75
1907	4,300	42	9.76	1,337	9	6.73
1908	5,459	42	7.69	2,674	26	9.72

This is certainly a death rate no higher than for a similar population in the healthiest localities in the United States. It is much lower than that for most parts of the country.

I believe that the debility from which the white man has suffered in the past at Panama and in other tropical countries is due to malaria principally, and that if he protects himself from this infection he will remain as vigorous and strong as if he were living in a temperate climate. As a reason for this belief, I would cite the health conditions of the Americans at Panama.

We have about 8,000 white Americans there, living under the same conditions that exist at home among men doing the same character of work. They are exposed to the weather fully as much as they are at home, a large proportion of them being exposed for eight hours daily to the tropical sun and rains. Notwithstanding this, the figures quoted show that their general health remains fully as good as it was in the United States.

The only difference between ourselves and the whites formerly in Panama is that we have succeeded in protecting ourselves entirely from yellow fever and also, to a considerable extent, from malaria. Yellow fever has a great effect on the death rate of a non-immune population, but it is not a noticeable cause of debility. On the other hand, malaria is a disease which may affect the individual for years, and in a locality like Panama is responsible for a widespread condition of debility throughout the population.

It is neither difficult nor expensive for the white man going to the tropics to protect himself from malaria. It is only necessary that he should screen his house well, drain and clear off the brush within one hundred yards of his residence. These measures are much less expensive than those he must take in the temperate zones to protect himself from cold.

The advances in tropical sanitation in the last fifteen years have shown that the white man can live in the tropics and enjoy as good health as he would have if living in the temperate zone. This has been demonstrated both by our two military occupations of Cuba and by our present occupancy of Panama.

The returns for labor are many fold greater in the tropics than they are in the temperate zone. I think, therefore, that during the next few centuries the tendency will be for the white man to drift to the tropics. I dare to predict that after the lapse of a period, let us say, equal to that which now separates the year 1909 from the Norman conquest of England, localities in the tropics will be the centers of as powerful and as cultured a white civilization as any that will then exist in temperate zones.

I believe that our work in Cuba and Panama will then be looked on as the earliest demonstration that the white man could flourish in the tropics and as the starting-point of the effective settlement of these regions by the Caucasian.

THE TEACHING OF DERMATOLOGY—DERMATOLOGY AND THE PHARMACOPEIA

CHAIRMAN'S ADDRESS BEFORE THE SECTION ON CUTANEOUS MEDICINE AND SURGERY AT THE SIXTIETH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, 1909

WILLIAM ALLEN PUSEY, A.M., M.D.
CHICAGO

There are two subjects which are now occupying a large place in the general policy of the American Medical Association. One of these is the effort at improvement of medical education. The other is the campaign in favor of the use of official remedies instead of proprietary or other remedies of uncertain or unknown composition. Both of these subjects are of direct importance to dermatology and I shall undertake, in the address which devolves on me as Chairman of this Section, to consider them in their bearings on our specialty.

THE TEACHING OF DERMATOLOGY

As you all know, the Council on Medical Education of the American Medical Association has been engaged for the last five years in an active campaign for improvement in medical education. The Council has lately undertaken the consideration of the subject of the medical curriculum and the standardizing of the medical course. With this end in view it appointed last summer a committee of One Hundred to prepare a Standard Medical Curriculum and this Committee was asked to draw up, through subcommittees, a curriculum for a four-year medical course; the plan of the Council being, not to establish a hard-and-fast curriculum to which all colleges should conform, but to furnish as nearly as possible an ideal curriculum which might serve as a standard by which schools might pattern. For the purpose of this study the Council divided the curriculum into ten sections:

1. Anatomy, including histology and embryology.
2. Physiology and physiologic chemistry.
3. Pathology and bacteriology.
4. Pharmacology, toxicology and therapeutics.
5. Medicine, including pediatrics and nervous and mental diseases.
6. Surgery; general and special.
7. Obstetrics and gynecology.
8. Diseases of the eye, ear, nose and throat.
9. Dermatology and syphilology.
10. Hygiene, medical jurisprudence and medical economics.

I was invited to act as chairman of the committee on dermatology and the following other members were appointed on the committee: Dr. Milton B. Hartzell, University of Pennsylvania; Dr. John A. Fordyce, University and Bellevue Hospital Medical College; Dr. T. C. Gilchrist, Johns Hopkins University; Dr. John T. Bowen, Harvard University; Dr. Grover W. Wende, University of Buffalo; Dr. Isadore Dyer, Tulane University; Dr. Douglass W. Montgomery, University of California; Dr. William T. Corlett, Western Reserve University; Dr. William A. Hardaway, Washington University.

Our committee was asked to make specific recommendations regarding the following points:

- (a) The place of dermatology in the curriculum.
- (b) Prerequisite courses, either preliminary or medical.
- (c) The necessary qualifications of instructors.
- (d) The best methods of teaching.
- (e) The necessary equipment.
- (f) The necessary clinical facilities.

(g) The proportion of didactic and laboratory or clinical teaching.

(h) The number of hours to be devoted to the subject.

Recommendations on these points were to be made with the following propositions in mind:

1. The medical course is to consist of four years of at least 900 hours each.
2. A preliminary college course shall be required including one year of physics, chemistry and biology.
3. The fundamental branches shall be taught in the first two years and the clinical branches in the last two years.

The Committee on Dermatology and Syphilis met in September last. The members of the committee found themselves in agreement on all essential matters and submitted a report which was unanimous, including the approval of the four members who were not present at the meeting. The scope of the committee as originally established had included dermatology and venereal diseases. The first point considered by the committee was this combination, and on this point it recommended that diseases of the skin and syphilis should constitute the group, and that gonorrhea and its sequelæ and accompaniments in the genitourinary tract should be included under genitourinary surgery. This recommendation, as well as all of the other recommendations of the committee were approved by the meeting of the chairmen of the ten sections held in New York Dec. 28, 1908. The further report of the committee, which was a slight elaboration of the report made to the meeting in New York, was the result of correspondence and represented an expression of opinion of nine of the ten members. This report was presented to a meeting of the chairmen of the ten subcommittees held in Chicago on April 5 last.

THE REPORT OF THE COMMITTEE

The essential part of the committee's report is as follows:

A. The course on dermatology and syphilis should preferably be placed in the senior year, but when necessary may be placed in the junior year. The feeling of the committee for placing the subject in the senior year is very strong and it believes that the course should be placed in the junior year only when the exigencies of the schedule make it practically impossible to place it in the senior year. A majority of the committee are of the opinion that to give the didactic instruction in the junior year and the practical in the senior would be better than placing the entire course in the junior year.

B. This department should have the student after he has finished the fundamental subjects and preferably after he has had a course in internal medicine.

C. At the head there should be a man who is an authority or a qualified expert. For his associates and assistants he should have men, preferably, who intend to make themselves experts in this department, or at least those who have had a reasonable amount of experience.

D. As the first condition of satisfactory teaching in this department there should be clinical instruction in small classes. In addition there should be a general clinic associated with the necessary didactic or systematic teaching. There is a very strong opinion in the committee in favor of small classes and the committee believes that most of the practical instruction should be given to the students in small groups. At the same time it is realized that dermatologic cases can be demonstrated more easily before a number of students than can most other cases and that the general clinic when properly conducted may be satisfactory.

E. The necessary equipment includes colored illustrations, projection apparatus, microscopes and the usual laboratory facilities.

F. There should be enough patients to illustrate repeatedly the commoner dermatoses.

G. Approximately two-thirds or three-fourths of the time assigned to this course should be given to practical instruction and the remaining one-third or one-fourth to didactic. The committee believes that one-fourth time for didactic instruction and three-fourths for clinical is a better ratio than one-third for didactic and two-thirds for clinical, but where the arrangement of schedules makes the division in one-fourth and three-fourths, respectively, impractical, it believes that the ratio or one-third for didactic and two-thirds for clinical teaching may be approved.

H. The number of hours assigned to this course should be ninety.

I. The scope covered by this group of subjects is definite and offers little opportunity for repetition by other departments. The following statement seems all that is necessary to avoid difficulty on this point:

The anatomy and physiology of the skin, excepting perhaps a brief review, should be left to their respective general departments.

The histopathology of diseases of the skin is so scantily considered in the other courses on pathology and is of so much importance that it should be given full consideration in this department.

In this department there should be given a systematic course on syphilis as a whole and a detailed consideration of its cutaneous manifestations. Detailed consideration of syphilis of the viscera and of other tissues than the skin does not belong to this department, but should be left to those departments where these subdivisions of the subject naturally fall.

Chancroids should be considered one of the infectious diseases of the skin and taken up by this department.

The cutaneous manifestations of the exanthemata should be covered by this department, but their general consideration should be left to medicine.

These recommendations were approved without modification by the meeting of April 5 last.

Of course these propositions cover in a very brief and dogmatic manner a broad subject on which there is room for much thought and perhaps some difference of opinion. As to the first and second propositions, I take it there would be no difference of opinion among us. Cutaneous diseases and syphilis should preferably be placed in the senior year and the student should take up dermatology after he has finished the fundamental subjects and, preferably, after he has had a course in internal medicine. In my judgment the last clause here "after he has had a course in internal medicine" expressed the important prerequisite qualifications for the study of dermatology. The student of dermatology should have an elementary knowledge of general medicine, and to take him in his junior year before he has completed such a course is an arrangement which can be justified only on the grounds of necessity; but anyone who has had to do with the arrangement of a medical curriculum knows only too well that a logical sequence in arrangement is a physical impossibility within the limitations which the length of human life places on the number of years to be devoted to the medical course.

As to the necessary qualifications of instructors, that is a proposition to which only a general answer can be given. I believe that the answer which is made by the committee is satisfactory. In my opinion, this condition for the adequate teaching of dermatology is one of the least difficult that we have to meet in the United States. With a rather extensive acquaintance among dermatologists in this country, I believe that there are few schools that can not obtain men qualified, as far as knowledge of dermatology goes, to teach all of the dermatology that can be included in an undergraduate's course. The dif-

ficulty is that most of the teachers will not, or are not so situated that they can, give the time necessary to the most satisfactory methods of teaching dermatology.

I believe teachers of dermatology, as other teachers of practical medicine, will have to come to understand that for satisfactory teaching of their subject they can not much longer confine themselves to one or two appearances a week before a class, but that they must give their time in large measure to the exacting duties that are involved in public hospital and dispensary attendance and in teaching small groups of students. This sort of work is most laborious, but it has its recompense in that it is as useful in increasing knowledge to the instructor as it is to the students.

As to the best methods of teaching dermatology, I believe that we have much food for thought. I think that our committee was unanimous in its opinion that clinical instructions in small classes is of the highest importance, and I have already intimated my belief that it is in this feature that dermatology, as now generally taught in this country, is weakest. If I can estimate the situation properly, the least valuable instructions which is given—and this applies to all departments of medicine—is that in which a teacher undertakes to instruct at one time a large body of students. In a subject like ours in which it is impossible, under the necessary limitations in time, to hope that students will be able to cover the subject thoroughly, I am inclined to believe that a short course of didactic lectures, sufficient to give an orientation of the subject, is useful and will be maintained; but I believe that it is impossible to avoid the conclusion that if we are going to give our students any practical knowledge of dermatology, no matter how elementary, it is necessary to bring them in sufficiently close contact with patients to allow them to observe accurately the clinical picture. In the time at their disposal it is impossible for them to obtain any wide knowledge of dermatology in this way, but from personal experience I can testify that it is surprising how much they learn from direct contact with a small number of patients. It follows as a corollary to this that we must have clinical material and, to obtain this, we must have facilities for taking care of it. Fortunately most of our cases are ambulatory, and a good dispensary will furnish all the material necessary. It is highly desirable, however, that this should be supplemented by a certain number of hospital beds. In this facility our department, as a rule, is weak, but not nearly so weak as it was a few years ago, and the increase in the last few years in the number of beds in our general hospitals allowed for cutaneous diseases makes me optimistic of what the future will do for us in this respect.

We asked that ninety hours as a minimum be assigned for instruction in this department and it was granted without debate. Of course, we would all like to have more. In my experience every teacher, not only in medicine but in all fields of instruction, is an Oliver Twist in this respect. We all know how depressing it is to undertake to give instructions in a large specialty like dermatology in the limited time that can be assigned to it in an undergraduate course, but the limitations of a student's time can not be disregarded, and, in my judgment, the ninety hours agreed on for dermatology and syphilis is sufficient to permit us to give an adequate course of elementary instruction.

I am sure that this subject is of great importance to dermatology in this country, and for that reason I have taken this opportunity of recalling it to your attention.

I am aware that, in presenting the matter in the way in which I have, I am making a sort of report of the committee's work to this Section, where, technically, the report does not come, but I am sure that the other members of the committee, like myself, feel that in acting in this matter we are assuming a responsibility that affects American dermatology as a whole, which is, in turn, most comprehensively represented by this body.

DERMATOLOGY AND THE PHARMACOPEIA

There is probably no other class of diseases which medical practitioners in general more frequently treat with proprietary remedies, of uncertain composition, than skin diseases. There is almost certainly no other class of diseases in which patients so frequently treat themselves with ready-made commercial remedies. There is perhaps no field of medicine which has been more exploited than dermatology by the makers of proprietary remedies. And I have had it said to me (but for the sake of my specialty I have vigorously denied it) that there is no class of practitioners who are more given than dermatologists to the use of proprietary remedies of all sorts.

I believe, therefore, that we may with profit to ourselves give some thought to the subject of the propaganda for the use of official or authenticated remedies which is being carried on by the Council of Pharmacy and Chemistry of the American Medical Association.

This body was established four years ago for the purpose of investigating and determining the value of remedies, not included in the Pharmacopeia and National Formulary, which were offered to or used by the medical profession. Up to the present time its work has consisted chiefly in examining proprietary medicines. In this work it has examined more than 700 articles; it has accumulated a vast amount of information about proprietary remedies, and has made the information readily available by publishing a book called "New and Nonofficial Remedies," which is to be published annually, bringing up to January of each year information covering all remedies examined that are regarded as worthy of acceptance. Incidentally, in addition to educating the profession concerning the value or lack of value of proprietary remedies, the work of the Council has exercised an enormous influence on the manufacturers of pharmaceuticals, because by publishing its findings in *THE JOURNAL* of the American Medical Association the Council has given standing to accepted articles and has given most disastrous publicity to fraudulent ones. I know no braver or more self-sacrificing public service than that which this Council has been carrying out, and no movement whose results for the medical profession are more important.

Aside from the many other abuses arising from the common use of proprietary remedies to which it has called attention, the Council on Pharmacy and Chemistry has shown that proprietary remedies coming from indiscriminate sources are wholly unreliable; that the practitioner who uses an unknown remedy, solely on the statements furnished by its proprietor, is in most cases acting on information which a careful man would not ordinarily accept as the basis for any important procedure. It has not shown that all manufacturers of proprietary articles are dishonest—far from that—or all proprietary pharmaceuticals unreliable, but it has shown that many are, and that the individual practitioner is not in most instances in possession of the information concerning the origin of proprietary remedies to enable him to distinguish between the reliable and

the unreliable. Particularly has it shown that the honest proprietor accepts investigation of his remedies in order that they may have the prestige of approval and that the proprietary remedy whose owner does not submit it to investigation is one which is likely to be unreliable.

In the four years that have passed, the Council has investigated almost all of the proprietaries; this work is practically finished, the Secretary of the Council tells me, except in so far as new agents present themselves—a small fraction of the work; and information concerning all remedies which have been accepted by the Council is available up to January, 1909, in the "New and Nonofficial Remedies." In order to keep this information closely up to date, it is intended to issue three supplements to this publication each year. Not only this, but the Council stands ready to examine and report within a short time on the character of any remedy submitted to it either by a proprietor or physician which, in the judgment of the Council, is worthy of examination.

This brings us face to face with a very concrete situation: In the Pharmacopeia, the National Formulary and the work of the Council, including its willingness to investigate new remedies, we have practically all of the remedies, or, at least, mixtures of drugs, whose composition and quality are guarded by official standards or authenticated by disinterested examination. In our use of drugs should we confine ourselves to these official and authoritative remedies or are we justified, in the face of the findings of the Council, in picking and choosing our remedies where we will, regardless of their authentication by these standards?

Many illustrations within the field of cutaneous therapeutics could be given from the findings of the Council to show that when we go outside of these standards we are likely to go blindly. The range of unreliability extends from the appropriation of common agents, like boric acid, under new names, through remedies of uncertain and highly problematical properties, to articles which entirely fail to contain the ingredients claimed for them. For example, I received, and I have no doubt the profession at large recently received literature calling attention to a new non-irritating 1 per cent. solution of mercuric iodid for hypodermic use in syphilis. The Council has on request recently examined this preparation and shown that it contains less than a hundredth part of the mercuric iodid claimed for it, if it contains any at all. How much blame should the practitioner place on himself, if, with no other knowledge than that furnished by the proprietor, he has used that preparation in a syphilitic emergency, like a cerebral endarteritis? Enough, I should say, to give him pause before again using a drug of unauthentic origin.

To take another illustration from the mercury preparations, there is in use for hypodermic medication a 1 per cent. solution of mercury sozoiodolate. Mercury sozoiodolate is insoluble in water, but is soluble in solutions of chlorids, iodids and bromids. And examination in the laboratory of the Council shows that the so-called solution of sozoiodolate of mercury is honest in so far as its mercury content is concerned. But when a mercuric compound is treated with an alkali iodid, like sodium iodid, an alkali mercuric iodid is formed. And, to quote the report, "from this it would seem that when mercury sozoiodolate is dissolved in sodium iodid, the compound is decomposed, and the solution contains sodium mercuric iodid. . . . If this is the case, the question at once arises, why should

not mercuric iodid be used in the place of the organic mercury compound, since the efficacy of mercuric iodid has been firmly established?" And the reporter suggests, as equivalent to the sozoiodolate solution in sodium iodid examined by him, the following very simple mixture:

R.		
Mercuric iodid.....	gm. or c.c.	
Sodium iodid.....	0 8	gr. xiiss
Water, q.s.a.....	3	gr. iiss
	100	fl.ʒiiss

I advise the reading of the publications of the Council on Pharmacy and Chemistry. You will not only find them interesting as contributions to our knowledge of human nature as it is exhibited in business, but, on the basis of my experience, I venture to believe that you will find them useful in refreshing your knowledge of chemistry, and, I am also almost ready to say, of materia medica and therapeutics.

Take again one of the recent aspirants for especial consideration as a local application—vasogen, for which so much has been claimed; this is, to quote the Council's report again, "essentially an ammonium soap and petrolatum—practically an ammonia liniment mixed with petrolatum." And iodovasogen, recommended as a substitute for iodine for external application, contains its iodine, not free, but chiefly in the form of ammonium iodid—quite a different sort of drug and one which certainly has not the same local action as iodine.

Vasogen serves well to illustrate another point about these proprietary remedies; and that is the danger of giving weight to testimonials to the value of these articles. As I write this I have before me one of the vasogen booklets with five pages of "bibliography," containing more than two scores of references to testimony on the value of this new ointment base. If I were an expert I would write a book on the psychology of the appeal of new remedies and of testimonials as to their efficacy.

In the light of the investigations of the Council I think that we are forced to the following conclusions: We should as nearly as possible confine our use of remedies to those authenticated by acceptance by official standards; particularly should we be careful on this point with proprietary articles. We can not without the greatest caution habitually use remedies whose composition and characters are not established, either by official recognition in the Pharmacopeia or National Formulary or in the "New and Nonofficial Remedies" of the Council—the only authoritative standards that we have. In the case of proprietary articles I believe that we would be on the scientific side if we confined ourselves absolutely to accepted articles. With drugs of definite and known composition, especially with pure chemicals and with other non-proprietary remedies of known composition or definite standards, we can safely allow ourselves much more discretion, provided we are informed as to their origin.

If we are going to use these standards as we should use them, it becomes highly important that the Pharmacopeia, the National Formulary and the "New and Nonofficial Remedies" should adequately represent the present state of our pharmaceutical knowledge, and if they do not we should take steps to correct the omissions. In the case of the "New and Nonofficial Remedies" and the work of the Council, there is, I believe, little for us to do, except to submit to them for investigation any new remedies that seem worthy of trial. It is doing its work well and is up to date. It serves to bridge the periods between the revisions of the Pharmacopeia, so that there may be no delay in furnishing

authentic pharmaceutical information. The only conditions which it requires for acceptance of articles are: that they shall not be fraudulent; shall be of known composition; shall not be advertised to the public and thus encourage self-medication, and shall not be useless or harmful. Certainly we could not require less exacting standards for the remedies we use, if we are to exercise ordinary intelligence in our prescribing. And if in connection with these very lenient requirements we remember that the Council stands ready to investigate without delay any remedy in its opinion worthy of examination, it seems clear that to conform to its standards in the use of remedies would not place any embarrassing or useless limitations on one's therapeutic resources.

In the case of the Pharmacopeia and the National Formulary there is a good deal that we may do. These official standards are revised decennially. New preparations are added and others are dropped. A critical comparison of the drugs and preparations, now officially recognized by these two standards, with our modern dermatologic materia medica, would, I believe, be of considerable value in improving for dermatologists the next editions of these works. It would show numerous preparations which might be omitted as useless and would call attention to some which should be officially recognized by these works.

The Pharmacopoeial Convention will welcome such suggestions. The Convention for the Revision of the United States Pharmacopeia meets in 1910, and the present, therefore, is an opportune time for effort in this direction. In view of this approaching convention I believe that it would be highly desirable for this Section to appoint a committee to consider this subject during the next year, with a view to offering suggestions concerning matters of interest which might properly be

Pharmaceutical Convention. This would be in line with the efforts of the Committee on Pharmacopeia which has been appointed by the House of Delegates of the American Medical Association.

In closing I wish to express the high appreciation I have of the honor conferred on me in selecting me to preside over the deliberations of this body. There are few things more grateful than evidences of esteem from one's colleagues.

Experimental Alcoholic Paralysis.—Aubertin and Lhermite (*Compt. rend. Soc. de Biol.*, 1909, lxi, 38) performed experiments to determine the localized nervous effect, if any, of chronic alcoholism. It was found that animals which were given quantities of absinthe daily developed paralysis of the posterior limbs, and after an interval of about ten months died of cachexia. Postmortem, the spinal cord showed a reduction in the number of nerve cells in the anterior horn. This reduction was fairly well confined to special groups of cells. The degenerating cells showed the appearance of chromatolysis. In the area of the atrophied nerve cells there was a great proliferation of glia cells. These changes were practically absent from all parts of the brain. The peripheral nerves were intact and showed relatively no lesions. Only a few interannular segments showed some degeneration on the medullary sheath. Since the changes in the brain are not sufficient to account for the systemic changes seen in the animal, Aubertin and Lhermite conclude that the paralysis is to be considered a result of poliomyelitis. It is further asserted that chronic alcoholism may be accompanied by paralysis associated with an extensive degeneration of nerve cells in the ventral horns of the spinal cord, and without any visible changes in the nerve fibers.

TWELVE YEARS OF PULMONARY TUBERCULOSIS TREATMENT IN THE WEST*

E. S. BULLOCK, M.D.

IN COLLABORATION WITH

C. T. SANDS, M.D.,
SILVER CITY, N. M.

The time has come when we should make a conscientious and scientific attempt to fix the value of climate, and especially high altitudes, in the treatment of pulmonary tuberculosis. I am not sure that it can be accomplished at this time, but that is no excuse for not trying, and one purpose of this paper is to assist, as far as possible, in the elucidation of this problem. I also desire to place before the profession, after twelve years of tuberculosis work, some practical observations along other than climatic lines, which I trust will be of service.

ALTITUDE IN TUBERCULOSIS

We must all admit that, until settled, the question of the place of climate in the treatment of pulmonary tuberculosis is one of great importance, for the physician certainly does not wish to send consumptives to distant resorts if as good results can be obtained nearer home. Twenty or twenty-five years ago there was an all-abiding faith in the efficiency of climate in tuberculosis, for the quite simple reason that nothing was done for consumptives at home, and all knew that some at least recovered when sent to distant climates. Then came the time when efforts were made in behalf of the too-long-neglected consumptive, and our beloved and respected Trudeau was among the first to show clearly that, in early stages especially, a certain proportion of these unfortunates could be returned to health and usefulness in their home climates. Then succeeded the period of almost childish enthusiasm for the results of treatment in home climates, and we are still passing through that stage, though there are portents of an early emergence.

It is curious and quite true that in many ways we are behind Europe, though as a nation not fond of admitting it; a little slow in backing a good thing (the sanatorium movement was twenty-five years late in reaching us) and still a little slow in discovering its limitations. In Germany, years ago, they found that the so-called cured patients were prone to relapse and die, and that the sanatorium must be supplemented by something else if the cured patients were to remain "cured." In this country we are just in the process of finding this out, especially those physicians who are not directly under the influence of the *esprit de corps* of the sanatorium movement. Such physicians, living in proximity to these institutions, have an excellent opportunity to observe the results, and often to care for the "cured" patients after relapse has occurred.

No man can spend years in contact with tuberculosis, and have left any great enthusiasm for the results of treatment, either climatic or otherwise, and most of us who have been long enough in the work rather lament the fate that made us specialists in the disease; for

*Owing to lack of space, this article is here abbreviated by the omission of a portion devoted to the consideration of therapeutic agents other than climate. A copy of the reprint containing the whole article will be sent by the author, or THE JOURNAL, on receipt of a stamped addressed envelope.

the unreliable. Particularly has it shown that the honest proprietor accepts investigation of his remedies in order that they may have the prestige of approval and that the proprietary remedy whose owner does not submit it to investigation is one which is likely to be unreliable.

In the four years that have passed, the Council has investigated almost all of the proprietaries; this work is practically finished, the Secretary of the Council tells me, except in so far as new agents present themselves—a small fraction of the work; and information concerning all remedies which have been accepted by the Council is available up to January, 1909, in the "New and Nonofficial Remedies." In order to keep this information closely up to date, it is intended to issue three supplements to this publication each year. Not only this, but the Council stands ready to examine and report within a short time on the character of any remedy submitted to it either by a proprietor or physician which, in the judgment of the Council, is worthy of examination.

This brings us face to face with a very concrete situation: In the Pharmacopeia, the National Formulary and the work of the Council, including its willingness to investigate new remedies, we have practically all of the remedies, or, at least, mixtures of drugs, whose composition and quality are guarded by official standards or authenticated by disinterested examination. In our use of drugs should we confine ourselves to these official and authoritative remedies or are we justified, in the face of the findings of the Council, in picking and choosing our remedies where we will, regardless of their authentication by these standards?

Many illustrations within the field of cutaneous therapeutics could be given from the findings of the Council to show that when we go outside of these standards we are likely to go blindly. The range of unreliability extends from the appropriation of common agents, like boric acid, under new names, through remedies of uncertain and highly problematical properties, to articles which entirely fail to contain the ingredients claimed for them. For example, I received, and I have no doubt the profession at large recently received literature calling attention to a new non-irritating 1 per cent. solution of mercuric iodid for hypodermic use in syphilis. The Council has on request recently examined this preparation and shown that it contains less than a hundredth part of the mercuric iodid claimed for it, if it contains any at all. How much blame should the practitioner place on himself, if, with no other knowledge than that furnished by the proprietor, he has used that preparation in a syphilitic emergency, like a cerebral endarteritis? Enough, I should say, to give him pause before again using a drug of unauthentic origin.

To take another illustration from the mercury preparations, there is in use for hypodermic medication a 1 per cent. solution of mercury soziodolate. Mercury soziodolate is insoluble in water, but is soluble in solutions of chlorids, iodids and bromids. And examination in the laboratory of the Council shows that the so-called solution of soziodolate of mercury is honest in so far as its mercury content is concerned. But when a mercuric compound is treated with an alkali iodid, like sodium iodid, an alkali mercuric iodid is formed. And, to quote the report, "from this it would seem that when mercury soziodolate is dissolved in sodium iodid, the compound is decomposed, and the solution contains sodium mercuric iodid. . . . If this is the case, the question at once arises, why should

not mercuric iodid be used in the place of the organic mercury compound, since the efficacy of mercuric iodid has been firmly established?" And the reporter suggests, as equivalent to the soziodolate solution in sodium iodid examined by him, the following very simple mixture:

R.	gm. or c.c.	
Mercuric iodid.....	0 8	gr. xiiss
Sodium iodid.....	3	gr. iiss
Water, q.s.a.....	100	fl.ʒiiiss

I advise the reading of the publications of the Council on Pharmacy and Chemistry. You will not only find them interesting as contributions to our knowledge of human nature as it is exhibited in business, but, on the basis of my experience, I venture to believe that you will find them useful in refreshing your knowledge of chemistry, and, I am also almost ready to say, of materia medica and therapeutics.

Take again one of the recent aspirants for especial consideration as a local application—vasogen, for which so much has been claimed; this is, to quote the Council's report again, "essentially an ammonium soap and petrolatum—practically an ammonia liniment mixed with petrolatum." And iodovasogen, recommended as a substitute for iodine for external application, contains its iodine, not free, but chiefly in the form of ammonium iodid—quite a different sort of drug and one which certainly has not the same local action as iodine.

Vasogen serves well to illustrate another point about these proprietary remedies; and that is the danger of giving weight to testimonials to the value of these articles. As I write this I have before me one of the vasogen booklets with five pages of "bibliography," containing more than two scores of references to testimony on the value of this new ointment base. If I were an expert I would write a book on the psychology of the appeal of new remedies and of testimonials as to their efficacy.

In the light of the investigations of the Council I think that we are forced to the following conclusions: We should as nearly as possible confine our use of remedies to those authenticated by acceptance by official standards; particularly should we be careful on this point with proprietary articles. We can not without the greatest caution habitually use remedies whose composition and characters are not established, either by official recognition in the Pharmacopeia or National Formulary or in the "New and Nonofficial Remedies" of the Council—the only authoritative standards that we have. In the case of proprietary articles I believe that we would be on the scientific side if we confined ourselves absolutely to accepted articles. With drugs of definite and known composition, especially with pure chemicals and with other non-proprietary remedies of known composition or definite standards, we can safely allow ourselves much more discretion, provided we are informed as to their origin.

If we are going to use these standards as we should use them, it becomes highly important that the Pharmacopeia, the National Formulary and the "New and Nonofficial Remedies" should adequately represent the present state of our pharmaceutical knowledge, and if they do not we should take steps to correct the omissions. In the case of the "New and Nonofficial Remedies" and the work of the Council, there is, I believe, little for us to do, except to submit to them for investigation any new remedies that seem worthy of trial. It is doing its work well and is up to date. It serves to bridge the periods between the revisions of the Pharmacopeia, so that there may be no delay in furnishing

in tuberculosis; for we never realize when an apparently trivial interference from us may mean the future welfare of our patients. When institutions go beyond a certain size, as in these government sanatoria, it is practically a lost factor. One thing we can say, however, about the men who direct these institutions; they are honest men, and their statistics are honestly and carefully compiled. Much more important than the character of the medical corps in its influence on results is the character of the patients handled at these government institutions. Without a doubt no other institutions, outside those of a penal character or insane asylums, can show quite so inferior a class of patients as these two have to accept. Their patients are mostly soldiers and sailors; equally improvident, thoughtless, dissipated, ungrateful, and to a great extent syphilized; it is almost impossible to hold them under treatment long enough to do them any permanent good; for, as you may not know, the length of time they remain under treatment is entirely in their own hands. Colonel Bushnell, in command at Fort Bayard, recently told me that the results among the officers, in whom he found a high

report 43 per cent. of cures and apparent cures; in the moderately advanced class they report 11 per cent. of cures and apparent cures, and in the far-advanced class 3.1 per cent. cures and apparent cures. In none of the approximately three thousand cases from which these figures were derived did tuberculin treatment enter as a factor. Further, nearly all patients presented tubercle bacilli in the sputum on admission; all were under treatment over thirty days, and no case was considered in which the patient was admitted arrested or cured. With one exception, to be presently discussed, these qualifications will be applied to all other cases and institutions considered in this paper. In many eastern institutions the plan has been adopted in classification of admitting patients with tubercle bacilli in the sputum credited to them if such had ever been present at any previous period, even though absent on admission. This is not the case with the western institutions discussed in this paper, where patients are credited with a sputum bacillary content at the time of admission only. I should explain, perhaps, that at Fort Bayard and Fort Stanton the results are substantially the same.

TABLE 3.—ADIRONDACK COTTAGE SANITARIUM 1907 REPORT: RESULT IN 157 PATIENTS DISCHARGED WHO REMAINED FROM 3 TO 26 MONTHS, OF WHOM 129 WERE TREATED WITH TUBERCULIN*

Condition of Patients When Admitted.	No.	%	Non-tuberculous.		Apparently Cured.		Disease Arrested.		Improved.		Unimproved.		Died.	
			No.	%	No.	%	No.	%	No.	%	No.	%	No.	%

Total	94	..	17	18	49	52	15	15	13	13	0	0

* These results are practically the same as for previous years and 16 of these patients did not present bacilli on admission—a class in which it is very easy to get cures anywhere.

grade of cooperation, were astonishingly good. Later on we shall show statistically the exact influence of character and temperament on results. Everyone who does this work recognizes the tremendous import of these factors on the part of patients in the final result, and for this and other reasons mentioned these institutions make much the worst showing of any of our western sanatoria. Therefore, no one can accuse us of unfairness in selecting the results of their work for comparison with that done at tuberculosis sanatoria located in unfavorable climates.

Now, just what has been accomplished in the cure of tuberculosis at Fort Bayard and Fort Stanton during the past ten years? For the sake of clearness I shall confine the question to "cure and apparent cure" which mark definite results, and about which there is little chance for difference of opinion in classification. For the moment I shall leave out of account the "arrests," the "improved," the "unimproved" and "dead." Those interested in these details will find them in Tables 1 and 2. Thus, readers will be able to carry mentally the essential facts and figures, and I shall avoid confusion in the final summing up. Also, for the same reason, I have combined and averaged the results at the two institutions under discussion. In the incipient class they

Dr. Sands and I have elected to compare the Fort Bayard and Fort Stanton results with those of four eastern institutions in the work of which climate can not be said to enter as a factor to any appreciable extent, and which, compared with each other, like the two institutions already considered, furnish about the same results, namely, the Adirondack Cottage Sanatorium, Sharon, in Massachusetts, the Massachusetts State Sanatorium, and the Rhode Island State Sanatorium. These institutions, as we know and admit, are about as well and scientifically conducted as any that exist. They are under the direction of tuberculosis workers from choice and not from orders, who are deeply interested in tuberculosis as a vocation, and at nearly all individualization is practiced to a great and influential extent. At these eastern institutions they have a much better type of individual to deal with, too.

Thus, it may be said, we have selected favorable eastern institutions to be compared with unfavorable western ones, and still we are able to show that Fort Bayard and Fort Stanton obtain better results. In considering these eastern results, we are still dealing with approximately three thousand cases, with the qualifications before mentioned. The combined results of the work at these institutions are given in Tables 3, 4, 5 and 6.

Cures and apparent cures in incipient cases, 42 per cent.; in moderately advanced cases, 6 per cent., and in far-advanced cases, 0 per cent. The difference is not great, but it is in favor of the two government institutions in New Mexico in each and every class, and when the differences before mentioned, in management and type of cases, as well as bacilli presented in all cases on admission, are considered, the difference becomes real and quite markedly in favor of high altitude treatment. In one of the institutions considered, namely, Sharon, Mass., the proportion of patients not presenting bacilli on admission was so very large that we compiled only such of their cases as presented bacilli on admission.

I am taking it for granted that, of course, all understand that proper management can not but be vastly more important than any climate. I desire to call attention to the fact derived from the above statistics that the differences become more markedly in favor of high altitude treatment the more advanced the cases. This is as it should be, for if there is anything at all in a favorable climate we should certainly expect to see its operation in the more advanced type of the disease. The

Further to elucidate this problem, Dr. Sands and I have elected to compare the results obtained at the New Mexico Cottage Sanatorium under our management with those of the Loomis Sanatorium at Liberty, N. Y., under the management of Dr. Herbert M. King. Both are private institutions in the sense that they do not receive government or state aid. We would not have chosen the results of our own work for comparison with that of the Loomis Sanatorium if another western institution of the same type had been available. This is a matter of taste and not of science, however; for we are as sure as can be that our statistics have been carefully and conscientiously compiled. It is hardly necessary to state here that, to be available for statistical comparison, all cases must have been classified according to the Turban scheme, as modified by the National Association for the Study and Prevention of Tuberculosis. This method has been employed in all the statistics used in this paper. As we all know, the personal equation is bound to enter into any scheme of classification so far devised, and it goes without saying that the best of classifications is necessarily imperfect. In order to free our sta-

TABLE 5.—SHARON SANATORIUM, 1907 REPORT: RESULT IN 18 PATIENTS DISCHARGED WHO HAD BACILLI ON ADMISSION AND IN A FEW OF WHOM TUBERCULIN WAS EMPLOYED*

Class.	No.	%	App. Cured. No. %	Arrested. No. %	Improved. No. %	Unimproved. No. %	Died. No. %

* Results correspond to those of previous years.

more incipient the case the more easily is the cure obtained anywhere; and, *per contra*, the more advanced the case the more necessary it becomes to avail ourselves of every favorable influence, and climate is apparently the most potent after proper management. In this connection we must not forget to emphasize the fact that at the two government institutions 60 per cent. of all cases admitted are far advanced. This is especially true of Fort Bayard, where a large majority of the patients have been subjected to the almost fatal Philippine climate. Tuberculosis in our army is part of the price we have paid for our tropical possessions, and here let me ask, if there is nothing in climate, why is it that every medical officer who has served in the Philippines will testify to the fact that not only is tuberculosis horribly common and fatal among the natives of European descent, as well as among the aborigines, but also that when one of our soldiers becomes infected the only way to save him is to get him home and to Fort Bayard as soon as possible? That is not very soon, however; it is a long way home from the Philippines, and these cases often go from incipient to far advanced between the time of diagnosis and arrival at Fort Bayard. Let us not forget, in the face of the above easily confirmed facts, that the climate of the Philippine Islands in its relation to tuberculosis bears a somewhat similar relation to the climate of our eastern states that the latter do to the climate of New Mexico.

statistics from bias as far as possible, however, they were checked direct from the case records by both of us. The figures were checked as well by the Rev. Francis W. Carroll, the chaplain of our institution. I might also add that if there was any doubt about the proper classification of a case we placed it in as unfavorable a light as it would stand. We are also sure of the statistics of the Loomis Sanatorium; for every one recognizes the honesty and scientific attainments of the head of that institution. We have chosen these institutions for comparison, because, unlike those already studied, they present the most favorable results obtained under their respective climatic conditions. In both institutions tuberculin has not been employed sufficiently to make it important to take its use into consideration. In both we are dealing only with cases under treatment over thirty days, and all cases admitted arrested or cured have been eliminated.

At the Loomis, in the incipient class, they obtained 62 per cent. of apparent cures; in the moderately advanced class, 16 per cent., and in the far-advanced class, 3 per cent. At the New Mexico Cottage Sanatorium we report in the incipient class 83 per cent. of apparent cures, in the moderately advanced class 50 per cent., and in the far-advanced class 13 per cent. Thus, it can be seen, the results are again in favor of the institution with favorable or high altitude climate. This is not a slight difference as in the previous instances, but

"he who runs may read." Again, as in the case of Fort Bayard and Fort Stanton, the more advanced the case the greater the difference in favor of high altitude treatment.

It may be of interest to know how we explain the marked discrepancy between the results of our own work and those obtained at Fort Bayard and Fort Stanton. We think we have already made that point plain in the discussion of those institutions, the character of their management and of their patients. In regard to the difference in our favor in the study of results at the Loomis and New Mexico Cottage Sanatorium, we are sure that Dr. King has no advantage over us in institutional essentials, although probably our superior in the management of tuberculous invalids; and yet his results are not as good as ours. The reason must lie in the more favorable climatic environment, especially high altitude, and such we think it is. Time, of course, is a large factor in obtaining good results in tuberculosis, and the fact that at the New Mexico Cottage Sanatorium the average length of treatment is 9.3 months, which is somewhat longer than most institutions report, may have a bearing on our results.

pointment. I trust that it may also help others to solve the problem: "What shall I do with my consumptive patients?"

For the sake of perfect fairness, let us exclude from our thoughts the results of the comparison between the Loomis Sanatorium and the one under our management, and think only of those remaining east and west. We can grant, I believe, that we have properly estimated the work at the government institutions and that the result is even more in their favor than it seems to be. Still the difference in favor of high altitude treatment is not sufficiently great to justify shattering every established rule of the treatment of tuberculosis for the sake of sending a consumptive to the distant high altitude climate. I will try to make just what we mean plain to all, and in order to do this it will first be necessary to show that the influence of an unfavorable temperament or financial condition is most important in the final result, and should certainly be considered in sending a patient far from home. If it seems certain that a properly regulated life is impossible, such a patient should not be sent away, for the natural tendency to irregularity will be more pronounced in the idle life

TABLE 7.—NEW MEXICO COTTAGE SANATORIUM: RESULTS IN 241 PATIENTS DISCHARGED, WHO REMAINED OVER ONE MONTH, EXCEPT THOSE ADMITTED CURED OR ARRESTED*

TABLE 8.—LOOMIS SANATORIUM AND ANNEX 1908 REPORT: RESULT IN 263 PATIENTS DISCHARGED WHO REMAINED OVER ONE MONTH, EXCEPT THOSE ADMITTED CURED OR ARRESTED*

Class.	No.	%	App. Cured. No. %	Arrested. No. %	Improved. No. %	Unimproved. No. %	No. Died.	%
Incipient	42	17	27 62	6 15	7 17	2 4	0	0
Mod. advanced	115	43	19 16	40 35	36 34	18 15	2	2.5
Far advanced	106	40	4 3	14 15	43 39	36 33	9	7.5
Total	263	..	50 11	60 22	86 32	56 21	11	4

* Forty of these patients were treated with tuberculin.

Before leaving the subject of statistical comparison it may be well to combine the results of the western institutions we have been considering and compare them with the combined results obtained at the institutions located in the east. Fort Bayard, Fort Stanton and the New Mexico Cottage Sanatorium in the incipient class report 56 per cent. of apparent cures, in the moderately advanced class 24 per cent., and in the far-advanced class 6 per cent. The Adirondack Cottage Sanatorium, the Massachusetts State Sanatorium, the Rhode Island State Sanatorium, the Sharon and the Loomis Sanatorium report 47 per cent. of apparent cures in the incipient class, 7 per cent. in the moderately advanced class, and 0.6 per cent. in the far-advanced class. So, finally, there seems nothing to do but gracefully to admit that high altitude treatment furnishes better results than can be obtained in unfavorable or low altitude climates.

Medical questions are notably knotty and difficult of solution. We so often work in the dark as regards important factors that there comes a time when doubt of nearly everything assails us. Many times I have had moods of black pessimism in regard to the rôle of climate in tuberculosis, but this study of statistics, undertaken primarily to convince myself and Dr. Sands, has helped me to feel satisfied with my lot and to know certainly that my task is not useless. To return to my little oasis in the desert is a comfort and not a disap-

such a patient is often compelled to lead. And if such a one is sent to an institution it will simply make things uncomfortable for himself and every one else. A patient of this type is likely to become a peripatetic consumptive, roaming the west in search of the health that is never found. If the financial condition is not such as to permit a patient to go away in peace of mind for at least a year, and have during that period the best of care and treatment, then such should be kept at home. Fifty per cent. of our cases are classed as unfavorable as to temperament or financial condition, and this operates against them as follows: In the incipient class the percentage in favor of the properly equipped individual as to money and temperament is 17; in the moderately advanced class 18 per cent., and in the far-advanced class 15 per cent. These figures are much too conclusive to be overlooked when deciding on the disposition of a tuberculous invalid. Practically, does it seem reasonable that any one can do well when constantly worried about money and other important things? I am certain that our results would not be nearly as good if I had not by persistent begging been able to keep many patients under treatment who otherwise would have been forced to leave the institution. Thus, by sending away persons not properly equipped, an enormous burden is thrown on our institutions for tuberculosis in the west, a burden that detracts largely from the pleasure and comfort that otherwise might be derived from the work. This

applies to our western communities as well, and in Los Angeles the evil of indigent consumptives has grown to such proportions as to compel the citizens to take united action to insure their future protection.

I have admitted that climatic treatment offers no wonderful inducements for sending consumptives far from home. To be exact, the chances of the incipient are increased 9 per cent. by proper treatment in a high altitude climate, 17 per cent. in the moderately advanced class, and 6 per cent. in the far-advanced class. I have also defined two classes that positively should not be sent away. I have also pointed out that a good climatic environment does not justify breaking all the established rules of the treatment of tuberculosis. The sanatorium régime, with its hard and fast rules and constant medical supervision, is easily the most important factor in treatment. Therefore, it is much better to keep a patient in an unfavorable climate and in a good sanatorium than in the most perfect climate in the world outside a sanatorium, and, except for an occasionally and practically useless call on a physician, do just about as he pleases the rest of the time. In illustration of this point permit me to observe that at a meeting of our local county society, the physicians present, the majority of those practicing in Silver City, admitted that

conduct our institution for much less than you can properly care for patients in private rooms in your hospitals here. Without our partial endowment the rate we are forced to charge would, of necessity, be higher than it is. A properly conducted institution for the tuberculous implies a full corps of doctors, nurses and all the usual hospital employés, and has more than a hospital plant as well, for, to get the best results, we must provide separate cottages for patients. It seems necessary to mention this matter, as so many of our eastern friends have asked us why we can not charge less, seeming to forget that it is unreasonable to ask us to do in a country of high prices what they can not and would not do themselves in a country of much lower prices. From its organization, three and one-half years ago, the New Mexico Cottage Sanatorium has supplied 2,246 months of treatment at a total cost to the institution, without profit, of \$202,140. As the average length of stay is 9.3 months, the average cost per patient is \$838, and, of course, to this sum must be added the cost of transportation. Thus, the total cost for nine months' treatment is nearly \$1,000, and it may readily be seen how impossible it is, at present at least, to bring sanatorium treatment in the west, for private patients, within reach of more than comparatively few of the vast army of human beings

TABLE 9.—NEW MEXICO COTTAGE SANATORIUM: CASES WITH FAVORABLE TEMPERAMENT AND FINANCIAL CONDITIONS

Table with 10 columns: Class, App. No., Cured. %, Arrested. No., Arrested. %, Improved. No., Improved. %, Unimproved. No., Unimproved. %, Died. No., Died. %. Rows include Incipient, Mod. advanced, Far advanced, and Total 121, or 50 per cent.

TABLE 10.—NEW MEXICO COTTAGE SANATORIUM: CASES IN WHICH EITHER TEMPERAMENT OR FINANCES WERE UNFAVORABLE

Table with 10 columns: Class, App. No., Cured. %, Arrested. No., Arrested. %, Improved. No., Improved. %, Unimproved. No., Unimproved. %, Died. No., Died. %. Rows include Incipient, Mod. advanced, Far advanced, and Total 120, or 50 per cent.

outside the institutions located in Grant County there had been only seven or eight cures in the memory of the oldest medical inhabitant. It is only fair to add, however, that the climate does help many people in the far-advanced stages to keep on living.

I do not mean to maintain that every consumptive outside of an institution is necessarily mismanaged; for here and there will be found a doctor who knows the ropes, and a patient with sense enough to cling to them, but such doctors and such patients are quite exceptional, we are sure. To sum up in a few words, I most emphatically maintain that no consumptive should ever be sent away if it is not certain that he will have as good care and management in the distant climate as he could obtain near home. It was genuine pity for the homeless and often itinerant consumptive that originally actuated me in taking up the work out west.

It is, of course, important to remember that, as I have shown, the more advanced the case the more essential it becomes to prescribe climatic change.

A word may be useful regarding the cost of caring for patients properly in an institution in the west. I am referring, of course, to private patients who invariably insist on certain things which might be eliminated without damage to the scientific régime in a truly charitable institution. Our institution is in no sense commercial, but is organized to pay for maintenance, the plant itself being an endowment. We have found it impossible to

afflicted with tuberculosis. It seems to us very practical, indeed, to mention these financial details, for so many, about 50 per cent., of the people sent west are utterly unable to cope financially with the conditions found on their arrival. To live outside an institution and to have all the essentials of a proper environment, including medical attention, is even more expensive, and often disastrous, for to save money, patients, when left to themselves, will eliminate things of vital importance to their welfare.

I might mention that 60 per cent. of all our cases have been far advanced, a class which in the east is practically barred from institutional treatment. It is certainly a question if the time and money spent on these far-advanced cases is justified in the light of actual results obtained under the most favorable conditions, namely, 13 per cent. of apparent cures and 30 per cent. of arrests, leaving at least 30 per cent. to die within a comparatively short time, and probably most of the remainder within ten years. This is an academic and not a practical question, for when put to it few will submit to having a money value placed on their lives. It resolves itself into this: Cure in tuberculosis is probable inversely as the square of the lung tissue involved; the more advanced the case, the greater the necessity of high altitude treatment, the longer the time required to effect a result, and consequently the more money needed by the patient, for, where an incipient

may recover in from five to six months, a far-advanced patient will require a year or more to make even a relative recovery. It may be granted, I think, that we are not devoting so much attention to this matter as an inducement for the practitioner to keep tuberculous people at home until they have become far advanced, although we are free to admit that the greatest pleasure we have is to observe the slow return to health of some at least of these so-called hopeless patients. From our point of view they are quite the most desirable class of patients; for they see and know the necessities of the situation and are more than willing to devote the time to getting well. It is rarely necessary to do battle with them to keep them long enough under treatment to obtain a substantial result, as we often must with the incipiens.

So far, in submitting proofs of the value of high altitude climates in tuberculosis, I have confined my argument to statistics. Of course, I can not but recognize, however, that the final decision will rest on statistical evidence carefully compiled and scientifically interpreted. Let us, however, for the moment, turn our attention to a collection of perfectly well-established facts, hardly less important to consider than those already studied. Time will not permit more than a glance at

the difference between the sun and shade temperature of 1 degree F. for every rise of 235 feet.

3. Asepticity of freedom from pathogenic germs, as proved by the researches of Pasteur and others. The effect of mountain air on the organs and functions of healthy and sick persons has been ascertained by repeated and careful observations to be as follows: The skin is tanned by the solar rays, and, according to Dr. Bowles, principally by the ultraviolet rays in the attenuated atmosphere. The circulation is at first quickened, the heart's impulse becomes more powerful, but the pulse rate at the end of six or eight weeks falls to normal, or even below normal. The respiration is at first quickened, but after a similar interval it gradually slows and is reduced to normal, or below normal. The breathing becomes deeper, the inspiration longer and the expiration more complete, and thus is explained the slowing of the respiration. At first there is reduction of the blood pressure, and in the amount of urea excreted by the kidneys, but more carbonic acid and water are eliminated by the lungs. When acclimatization is complete, the urea appears in full quantity in the urine, and the blood pressure again increases.

Accompanying and exactly coinciding with the reduction in the pulse and respiration the thorax expands in several directions, causing an increase in circumference at various levels of from one to three inches or more, also an augmentation of the spirometric record and increased mobility of the chest walls. The thoracic expansion is caused by the greater physiologic activity and development of the lungs due to rarefaction of the air.

TABLE 11.—RESULTS OF DIFFERENT CLIMATES COMPARED AFTER WILLIAMS

	Number of Patients.	Average Residence, Months.	First Stage.	Second and Third Stages.	Results.						
					General.				Local.		
					Bilateral Affection.	Improved.	Stationary.	Worse.	Arrest.	Improved, including Arrest.	Stationary.
High altitudes	247	12%	65%	33%	32%	83%	1%	14%	4%	85%	9%
Sea voyages	65	9	65	37	34	77	1	21	4	53	33
Riviera	210	9	59	41	35	65	10	24	5	36	15
British climates	292	9	58	42	42	63	8	28	2	29	11

the different factors of a good climate for tuberculosis, and the rôle each fills, and some, of necessity, we shall be compelled to overlook entirely. It is curious how a work of genuine merit is sometimes completely forgotten, and how a succeeding generation must rediscover it and learn it all over again. This is true of the epoch-making paper of Sir Herman Weber, read in London in 1869, which resulted in the use of the high altitudes of the Alps in the treatment of tuberculosis from that day to this. Sir Herman Weber had his predecessors, of course; among the most notable were Lowhard, Archibald Smith and Jourdanet, who, some of them, many years before, had advocated high altitude in tuberculosis. Weber stated that altitude from 5,000 feet up was the one important factor in climatic treatment, and if that were provided we need not argue over other things, humidity, rainfall, etc., which "may modify but do not hinder the effects of altitude."

Williams of London, than whom there is no greater living English authority in the treatment of pulmonary tuberculosis and who has employed high altitude in his practice for the past forty years, states:

The characteristic effects of mountain climate are:

1. Diminished barometric pressure and consequent rarefaction of the atmosphere.

2. Diathermancy of the air, or the increased facility by which the sun's rays are transmitted. This, as the late Dr. Denison of Denver was the first to show, causes an increase in

This is recognized by the measurements alluded to above and by the physical signs; for the respiratory sounds are heard over a larger area in the thorax than is usual, and thoracic expansion is further proved by the wearer's clothing becoming too tight around the chest. More oxygen is consumed by the blood and more carbonic acid gas is given off. These changes in the thorax and its contents in visitors to the mountains are exemplified more fully in the mountain races; for the Indian of the Andes, the hill tribes of the Himalayas, the guide and chamois hunter of the Alps have all enormous chests and are characterized by great respiratory power.

Dr. Williams states, as well, that of all his consumptive patients those treated in high altitudes yielded the most favorable results, and, what is more important, the fewest relapses. He gives the results in about 850 cases as follows: treated in high altitudes, 83 per cent. improved, as against 63 per cent. in England, which, as will be remembered, represents about the difference between the Loomis Sanatorium and our own work. Dr. Williams further states:

In no country can the high altitude treatment be more effectively carried out than in the United States, where the tract of high-lying land is of vast extent and where altitudes of from 5,000 to 10,000 feet are available and being situated in temperate latitude, present a great choice of climate.

All these facts in regard to the effect of high altitudes in consumption have been confirmed over and over again; there is hardly anything in medicine better sub-

stantiated. They have a right to take their places among the established contributions to our art and science. Let us not be deafened by the loud blasts of the trumpet of anticlimax, which has been so strenu-

Diagrams, after Theodore Williams, showing increased chest girth after sojourn in high altitudes. The solid lines show girth before, and dotted lines girth after stay in high altitude.

ously blown the past few years, and try not to forget what has been done by scholarly workers in Europe to prove the place of climate in tuberculosis. In imagination let us turn our eyes to the Alps, and there in the snow and ice and among the tall pines see the multitude of sanatoria for consumptives which dot the mountain sides and realize that Europe believes in altitude and climate in tuberculosis.

I should not leave this subject of altitude until something has been said of the results of our blood-pressure studies. I can not give all the details of this investigation, but can briefly indicate the results. It is positively known that coincident with improvement in tuberculosis there is a rise of blood pressure, and this phenomenon occurs, of course, in any altitude. Dr. Thayer of Baltimore recorded the blood pressure in a large number of consumptives and found it to average 100 mm. of mercury, showing conclusively the influence of tuberculosis in lowering blood pressure. Granting that Dr. Thayer's figures are correct, it becomes clear that continued residence in a high altitude tends to raise the blood pressure, after the primary fall has been recovered from. Among 350 of our patients, the average blood pressure in all classes is 130 mm. of mercury. Thus, we may have stumbled, for aught we know, on one at least of the specific reasons why high altitudes are beneficial in tuberculosis. Continued residence in a high

altitude causes complicated changes in the blood itself, as well also as an increase in hemoglobin, but further studies are required to elucidate them.

At this point I can not resist the temptation of pointing out the scientific advantages which would accrue from the establishment of a special laboratory at a selected spot in the Rocky Mountains for the study of effects of high altitudes on human beings, both sick and well.

PHAGOCYTOSIS IN RELATION TO ARNETH'S CLASSIFICATION OF NEUTROPHILES *

J. E. POTTENGER, A.B., M.D.
MONROVIA, CAL.

If the experience of perhaps most workers who have written on the subject is to be accepted, the opsonic index as a means of diagnosis and especially as a therapeutic guide is far from satisfactory.

Disregarding the possibility that much of this adverse criticism is due to incomplete mastery of detail, there still seems good theoretical ground for not accepting some of Wright's earlier views on the question. In disregarding the leucocyte entirely he seems to have done wrong, since various observers have called attention to the variability of phagocytic activity by leucocytes obtained from various sources—in certain stages of infection and in artificially induced leucocytosis. But as far as I can determine no one has offered a satisfactory explanation for this varied activity.

Neutrophiles, drawn from the microscopic field. Figure below each neutrophile expresses the average number of staphylococci ingested by the corresponding cell in a series of 9 bloods, aggregating 1,200 neutrophiles.

Believing that Arneth's classification¹ of neutrophiles in conjunction with the phagocytic power of the neutrophile might throw light on this question, I made the following study:

Phagocytic tests were made with the blood of various patients presenting considerable variation in the number of cells belonging to the different classes of Arneth, and the average number of organisms ingested by the cells of each class was observed, in order to determine if constant relative phagocytic power existed for each class of cells.

* From the Laboratory of the Pottenger Sanatorium
1. Arneth: Die neutrophilen weissen Blutkörperchen bei Infektionskrankheiten, 1904; Die Lungen Schwindsucht, 1905.

The method of Dodds² was employed for simplicity, and the film preparations were stained with Hastings' modification of Nocht's stain. A serious obstacle was encountered, however, in that it was very difficult to assign all cells to their proper classes because of occasional overlapping of parts of the nuclei. While these doubtful cells were not many in number and did not materially alter the class percentage, yet taken in connection with their respective phagocytic powers, it became imperative to obtain a better technic.

The technic of Wiedenreich³ offers two great advantages over dry blood preparations. First, the cells are fixed while in amoeboid motion; second, the parts of the nucleus are distanced from each other so that overlapping is a rare occurrence. This beautiful technic seems to be a most important advance for the accurate study of the morphology of the leucocyte. The advantage is shown in the fact that, while I found 12 per cent. of cells of doubtful classification in a total of 700 counted in the dry preparations, by employing Wiedenreich's technic the doubtful cells fell to 1.1 per cent. of 1,200 counted. Thus the error is negligible so far as the proper classification of cells is concerned.

The figures in the illustration drawn from the microscopic field will illustrate the beauty of the technic.

The individuals of this series of nine counts varied somewhat. In only one was phagocytosis greater in Class I than in Class II, and this was evidently the result of a clump of organisms which increased unduly the result. In four of the series there was a gradual rise in phagocytic power from Class I to Class IV, inclusive, and a decrease in Class V. In another four the same relation obtained with the exception that Class III was slightly lower than Class II.

I have made a similar differential phagocytic enumeration in the pus from a boil, counting 400 cells. In this the cells of Class I are only one-half as phagocytic as Classes II and III.

Now, in view of the fact that the blood picture from different individuals varies greatly, especially in disease, in the proportion of its several classes according to Arneth, it seems important that the true opsonic index, or, better, the phagocytic power of the blood, be obtained by the use of the patient's own corpuscles as well as serum.

To illustrate, I present two divergent types of blood from my records, all tuberculous patients:

TWO DIVERGENT TYPES OF BLOOD—ARNETH'S CLASSIFICATION

	Class I.	Class II.	Class III.	Class IV.	Class V.	W.B.C.
Mr. B.	33	40	20	5	2	13,300
Mr. G.	63	25	12			8,400
Mrs. J.	47	44	8	1		5,200
Normal	5	41	35	17	2	6,900

The first two are of the type anisohyperleucocytosis, while the third is of the anisonormoleucocytosis type. Now, in the second case above, 63 per cent. of the cells are of weaker phagocytic power, and one would surely obtain quite different results if with the same serum should be put up opsonic mixtures with these cells and those from a normal person.

While I am aware that this work must be continued with great care before any definite rules may be established, yet I feel justified in offering the following conclusions:

1. There is more or less definite phagocytic value for each variety of neutrophile (Arneth's classification) acting on staphylococci.

2. This fact will surely throw light on the varying phagocytic values of neutrophiles obtained from various sources.

3. It may aid in the solution of the question of leucocytosis induced for therapeutic purposes.

4. It is evidence that Wright's early assumption, namely, that the leucocyte is a comparatively indifferent factor, is wrong.

A STUDY OF MALNUTRITION IN THE SCHOOL CHILD*

E. MATHER SILL, M.D.
NEW YORK

This study was undertaken with a view to determine as far as possible the etiologic factors, which to a large extent are at the bottom of this very prevalent condition found in our city children, especially of the school age.

CAUSES OF MALNUTRITION

The subjects were all taken from the laboring and tenement-house classes and the parents were mostly foreigners. Each little patient, after having a careful physical examination, was weighed, a full history obtained from the mother through a trained nurse who spoke her language, and anything such as tuberculosis, syphilis or other diseases that would have a bearing on the condition of the child carefully noted. Then the following questions were asked the mother: "What does the child get for breakfast, for dinner, for supper? How many rooms have you? How many in the family, including boarders? Do you keep your windows open at night to allow the circulation of fresh air, and air the house in the day-time? When does the child go to bed? Does the child eat between meals—candy, etc.? How often does the child get a tub bath? Is the child in a grade with children of its own age at school?"

The answers to all these questions were tabulated opposite the name of each child with its history, weight and age. In 210 malnutrition cases in my own clinic on the lower East Side, it was found that meals were given as shown in Table 1.

TABLE 1.—DIET IN 210 MALNUTRITION CASES

Breakfast.		Dinner.		Supper.	
Tea or coffee and bread ..	165	Tea or coffee and bread ..	28	Meat-soup	136
Cocoa or milk and bread ..	30	Meat-soup and potatoes	116	Coffee or tea and bread or cake	45
Milk or tea and egg	10	Coffee, egg and bread	29	Bread and Milk	15
Coffee and oatmeal	4	Bread and onion soup	2	Bread, milk and soup	4
Nothing	1	Fish or egg or bread	6	Bread, milk and fish	2
		Rice and milk ..	2	Milk and egg ..	3
		Egg and milk ..	5	Coffee and egg ..	4
		Cocoa and bread ..	4	Nothing	1
		Cocoa-egg	1		
		Bread and milk ..	10		
		Egg and bread ..	6		
		Nothing	1		

The table shows that 175 drank tea or coffee at least once a day and many (25 per cent.) had tea or coffee two or three times a day. We find cereals given only six times. In other words, 83 per cent. of these children practically depended for their diet on tea or coffee and bread.

2. Dodds: Modification of Leishman's Method of Estimating the Opsonic Index. Brit. Med. Jour., Oct. 12, 1907.
3. Wiedenreich: Arch. f. micr. Anat. u. Entwicklungsgesch., May 30, 1908, p. 212.

* Read in the Section on Stomatology of the American Medical Association, at the Sixtieth Annual Session, at Atlantic City, June, 1909.

Of the 210 families examined, 3 had 1 room, 34 had 2 rooms, 114 had 3 rooms, 52 had 4 rooms, 3 had 5 rooms, 1 had 6 rooms. This makes the average number of rooms per family 3. The size of these three rooms averages 3,600 cubic feet. Seven families had 3 members each, 34 had 4 in the family, 49 had 5 in the family, 48 had 6 in the family, 22 had 7 in the family, 15 had 8 in the family, 12 had 9 in the family, 10 had 10 in the family, 4 had 11 in the family. The average size of the family was 6. This allows only 600 cubic feet of air space for each person.

Sixty-two per cent. kept their windows closed. Fifty per cent. of the children ate between meals—candy, etc.; 13 per cent. were in a grade at school with younger children. Of these children, 21 per cent. went to bed at 8 o'clock, 40 per cent. went to bed at 9, 24 per cent. went to bed at 10, and 12 per cent. went to bed at 11. These children were all under ten years of age and should have been in bed at 7 o'clock.

We found that 18.5 per cent. had a bath once a week; 22 per cent. had a bath once in two weeks; 11 per cent. had a bath once in three weeks, 18.5 per cent. had a bath once in four weeks, 22 per cent. had a bath once in three months, 4 per cent. had a bath once in two months, and 4 per cent. had a bath once a year.

We found that all these malnutrition patients were decidedly under weight for their age compared with the weight of normal children, the discrepancy varying from 4 to 16 pounds. Many children were found to be of the same weight as normal children who were from one to three years younger and in extreme cases there was even a difference of four years, and the cases were not picked but all malnutrition cases just as they came.

The ages of these children were from three to ten years but the great majority (175) were from six to ten years (or the school age). One thousand other children in the primary schools, in the Jewish quarter on the East Side were examined by me. Of these 40 per cent. were found to be poorly nourished, under weight and more or less anemic. These were, therefore, malnutrition cases. These children were from six to twelve years of age. Eighty-six per cent. had dental caries, 90 per cent. had adenoids, 40 per cent. had hypertrophied tonsils, 6.5 per cent. had defective hearing, 10 per cent. had defective vision, 4.5 per cent. had tuberculous lymph nodes of the neck, 1 per cent. had pulmonary disease, 0.4 per cent. had cardiac disease, 0.8 per cent. had chorea.

It will be seen that a very high percentage of these children had dental caries, and I believe we should put down this as one of the causative factors in malnutrition, since bad teeth mean improperly masticated food and disordered digestion, and painful teeth cause anorexia.

Whether the very high percentage (90 per cent.) of adenoids is due to the climate of New York City or the poor ventilation is a subject open to discussion and will require further investigation; but probably both causes are in a measure responsible.

Of the 210 patients examined in my own clinic 75 per cent. had enlarged cervical glands. One hundred and one of these children were tested for tuberculosis either with the Moro ointment test or the von Pirquet cutaneous test and some with both and 55 (55 per cent.) gave a positive reaction. Thirteen per cent. gave a family history of tuberculosis.

Practically all these children had defects and complications other than the malnutrition, the variety and per-

centage of which was very much the same as those found in the children examined in the schools. A detailed list of these defects would necessitate too long a paper.

It was observed that many of these children were in such a condition that they had no desire for good nourishing food and, indeed, could not retain it, because their stomachs had become so accustomed to the tea and bread or coffee and bread diet. The mother would say when told what food the child required, "But, doctor, she will not take it." Von Noorden accounts for this condition by stating that the activity of the digestive organs during starvation is lowered and the secretion of saliva, gastric juice, bile, and intestinal secretions diminish. In many of these cases the stomach had to be gradually educated to a stronger diet and the children were treated just as one would treat convalescents from disease.

It has been found that tea diminishes all the secretions of the alimentary tract and thus we see another reason for this inability on the part of the stomach to take food. Thus many causes play their part in bringing about malnutrition in the child, but two causes stand out prominently and common to all, namely, insufficient and improper nourishment, and bad housing. As Kerley has aptly put it, the child does not get what it has a right to demand.

Poverty, I am forced to admit, is an important factor in the causation of this chronic starvation or ill-nourished condition, but ignorance on the part of parents plays even a more important part—ignorance as to food-values, ignorance as to cooking, ignorance as to how to live, ignorance as to cleanliness, fresh air and sunlight. Although very few mothers had a proper idea of what foods were nourishing, or how to cook foods properly to make them nourishing, all were willing and glad to be instructed, and it seems to me that just here lies in a measure the partial solution of this problem. Since the mother who loves her child is by far the best instrument the state can employ to see that that child is properly nourished, fed and cared for, and in providing for its real education, the mothers are better than teachers, school managers, medical inspectors or attendance officers. It is economy to educate and improve the mothers and in that way guide the natural love to be an effective help in bringing up children to be healthy and useful citizens.

Visitation of the homes of underfed children and instruction of mothers would wonderfully reduce the number of these underfed children. The employment of the mother is responsible for many neglected children; given a father out of work or sick, and the mother must take in sewing or go out to work, with too often the result of underfeeding of not only the children, but herself as well.

A few statistics quoted from other writers may give a more adequate idea of the vast numbers of children involved and the importance of the subject.

Robert Hunter says: "Few of us sufficiently realize the powerful effect on life of adequate nutritious food. Few of us ever think of how much it is responsible for our physical and mental advancement or what a force it has been in forwarding our civilized life." Again, Hunter says that 60,000 to 70,000 children in New York City, "arrive at school hungry and unfitted to do well the work required of them. And at least 3,300,000 under fourteen years of age are underfed in the United States."

My own figures show an apparently greater number of underfed or more correctly speaking ill-nourished children in New York City, and fewer in the United States.

The latest available figures show that there are 241,917 school children in the elementary schools (primary and kindergarten) of Manhattan, and 555,525 elementary school children in Greater New York City. My statistics show that of this number there are approximately 96,778 in Manhattan and 222,210 in Greater New York City that are ill-nourished.

The census of 1900 shows that the urban population is increasing much more rapidly than the rural population of the United States. The increase in the total population in the United States from 1890 to 1900 was 20.8 per cent., while the increase in the urban population during that time was 36.8 per cent. This shows that we are becoming more and more a people dwelling in cities. We find the urban population in the United States in 1900 was 28,411,698.

Of the total population, 19.82 per cent. of pupils were enrolled, (or we might say now practically 20 per cent.). This would give us 3,682,239 school children in the cities in the United States. It is in the cities where we see the overcrowding and bad feeding mostly, and therefore most of the ill-nourished school children.

My statistics would show, then, that there are approximately 1,472,895 ill-nourished school children in the cities of the United States.

In the report of the Interdepartmental Committee on Physical Deterioration, Dr. Echholz, a British school inspector, states that on examining children in the Johanna Street Board school, in Lambeth, a type of school in a very bad district, 90 per cent. are found unable by reason of their physical condition, to attend to their work in a proper way, while 33 per cent. during six months of the year, require feeding. He estimates the number of underfed children in London as approximately 122,000.

Dr. Mackenzie considers more than one-third of the children in Edinburgh ill-nourished. These percentages from the cities in Great Britain correspond closely with my own in the cities of the United States.

John Spargo, in his excellent work, "The Bitter Cry of the Children" says that a crude investigation in the public schools of New York found out of 12,800 children, 2,950, or more than 23 per cent., wholly breakfastless or provided with miserably poor breakfasts.

A more careful and systematic investigation was made by Dr. H. M. Lechstrecker, of the New York State Board of Charities. He examined 10,707 children in industrial schools of New York. Of these, 998 had coffee or coffee and bread only for breakfast; 439 or 4.10 per cent. had no breakfast; 998 or 9.32 per cent. were anemic, owing to lack of nourishment. Only 1,855 or 17.32 per cent. started the day with an adequate meal. These astounding figures should indeed thrill every true American with the importance of the subject and the duty each of us owes to humanity for the relief of this curse which is sapping the life of our coming generation and threatens the health and strength of our nation. It is our duty to give this vital and far-reaching question our most careful thought and study, and to try to evolve means whereby this state of affairs among our poor can be properly, scientifically and adequately dealt with, as it involves the lives of our future American citizens.

Is it not absurd to force these little half-starved things to attend school as our compulsory school laws do force them? Is it fair to suppose that a hungry child, wasted and weakened, with the attendant conditions of lassitude, irritability, nervousness and anemia, the result of prolonged underfeeding and bad housing, can study in school for five hours with scarcely any intermission?

Although great advancement in the science of education has been made in the past twenty-five years, the physical condition and development of the child has been grossly neglected. When the child has a poorly developed and weakened body little can be expected from it in the way of mental development or advancement. The duty of the nation is, first of all, to care for the proper feeding and housing of its children and so to insure their proper growth, development and health.

A. F. Tredgold informs us in his book on "Mental Deficiency" that insufficiency and improper feeding, absence of fresh air or warmth, and the general neglect which unfortunately prevails during the early life of many of the children in our densely populated industrial centers, produces a retardation of the mental growth which is not permanent and is not therefore dementia. "Under more congenial surroundings the brain rapidly recovers and the child soon regains the normal standard."

Thus, no doubt the so-called stupidity or backwardness of many children in the public schools is simply the result of neglect and underfeeding.

Dr. Collie, Medical Inspector for the London School Boards, says that mental disability is not only preventable but in many cases curable. The brains of these underfed children are starved and fail to react to the ordinary methods of teaching.

Von Noorden, from experiments on man and animals has deduced the following law: "The expenditure of energy during starvation diminishes in the same proportions as the weight of the body, apart from extreme degrees of emaciation or adiposity and with moderate bodily exercise by day and normal hours of sleep by night." The operation of this law of Von Noorden, then, would account for the lassitude, nervousness and loss of energy seen in these children.

Atwater's experiments show that a larger amount of protein is required with physical labor than with mental labor and more energy utilized; therefore, the importance and necessity of a high proteid diet in the active child—and every healthy child is active. It has been shown by Atwater that a man on a vacation requires 79 grams of protein per day for a diet of maintenance which produces 3,125 calories of energy. It is known that three quarters of the amount of proteid necessary for an adult is necessary for a child. A growing child would therefore require about 59 grams per day, which would produce about 2,330 calories of energy. This proteid should be given largely in the form of a vegetable proteid. Children, by reason of their rapid digestion, and great respiratory activity should have about as much carbohydrate as adults.

Atwater also states that a child under two years requires 0.3 the amount of food of a man doing ordinary work; from six to nine years 0.5; from ten to thirteen years 0.6; a girl from fourteen to sixteen years 0.7; a boy from fourteen to sixteen years 0.8.

The growing child, requiring a highly nutritious diet, requires also a great deal of fresh air to oxygenate

the food properly. This requisite is impossible; as we shall presently see, with the housing conditions as they are. The conditions of overcrowding in New York, (and in fact in all our great American cities) has become a most menacing one.

The census of 1900 showed that more than 2,000,000 in Greater New York lived in tenement houses. These tenements then contained, according to Ernest Pool of the University Settlement, 361,000 interior living-rooms without light or ventilation. The number of these insanitary and disease-breeding rooms has since been reduced by 31,000 through the efforts of earnest men and women, leaving still the great total of 330,000 of these death-traps.

When actual figures show that six people on an average are crowded together in three small rooms, two of which are often inside rooms, the sum total of the air space in these rooms averaging about 3,600 cubic feet, (which is only half the air space that six people should have) is it any wonder that so many are in such a pitiful condition of health and that the contagious diseases and tuberculosis are so prevalent in this quarter?

Charles Edward Russell writes that in the most crowded regions on the East Side of New York the increase of population from 1900 to 1905 was about 33 per cent., while the increase in the whole borough was only 14 per cent.

There are 51 blocks in New York that shelter nearly 200,000 persons and the congested lower East Side contains about 600,000 people. Its area is only 0.5 per cent. of the total area of the city. What kind of children can we expect from people living under such conditions? And it is from this quarter that a large proportion of school children are drawn.

These same insanitary and overcrowded conditions have existed in London's East Side (Stepney) for the past thirty or more years and we only need to read some of the recent articles on the subject to realize the gravity and horror of it all, and the appalling results to the people. Shall we not take warning from these conditions?

If one compares the tenements of Berlin with those of New York, one is at once impressed with the foresight of the German people in providing these beautiful, light, sanitary and airy tenement-houses with wide balconies and courtyards and playgrounds for the children. Germany knows that the strength of the nation depends on the health of the working masses.

As it has been shown (at our last International Congress on Tuberculosis) that tuberculosis costs the nation each year millions of dollars and as this dread disease follows closely in the wake of bad housing and bad feeding, it does not take much calculating to see that to prevent these evils, even at a great cost, would really be money saved to the American people.

This then, is the state of our great American cities and in case of war, our soldiers must needs be drawn from among these poor anemic underfed weaklings. What is the use of battle-ships if we have no men to man them? Is it a wise thing for the American people to sit still and say nothing when laws should be passed compelling the building of sanitary habitations with plenty of room to breathe and plenty of sunlight? What does all this investigation show? To my mind it shows that the present way the poor are fed and housed in the large cities is responsible for much suffering, many lives lost, much sickness, degeneration, demoralization and the blighting of thousands of lives.

I believe that the present condition of affairs in the congested parts of our great cities could be entirely changed and controlled by laws. This can never be accomplished by private charity but must be dealt with and provided for by the state and national legislature; since laws governing these things are necessary for the public safety, health, and welfare.

There is no reason why New York and other great cities should not have just as good tenements as Berlin. We are too busy in the games of graft and grab. It is simply our short-sightedness, greed and haste to get rich that has allowed us to build and retain the present style of insanitary tenements. Let us reform before it is too late.

TREATMENT

In the treatment of this condition our first duty should be to instruct the mothers in the schools and clinics, either by word of mouth or printed directions, as to what foods are best for the growing child, which are the most nutritious and healthful for the money, the best way to cook different foods, what articles of diet to avoid, and the necessity of plenty of fresh air and sunlight, and cleanliness. Warm clothing is a necessity.

These children should be given a highly nutritious diet, that is, foods that contain a large amount of proteid material. Table 2, from Atwater, shows the percentage of proteid in a number of common articles of diet which contain a high percentage of proteid and consequently have a high nutritive value, but when it is a matter of dollars and cents, we must choose those foods which are nutritious and at the same time inexpensive. The most of the foods in this table are comparatively inexpensive for their food value.

TABLE 2.—FOODS THAT CONTAIN A LARGE AMOUNT OF PROTEID, ACCORDING TO TABLE OF ANALYSIS

	Proteids. %	Nutri- ents. %		Proteids. %	Nutri- ents. %
Beef	13.8 to 30	36.3	Cow's milk..	3.4	12.6
Hen's eggs..	11.6	23.2	Wheat flour.	13.5	
Chicken	14.2 to 15.4	16.2	Graham flour	11.7	
Bluefish	10.2	40.3	Oatmeal ...	15.1	
Salmon	24.1	40.6	Maize meal..	9.1	
Mackerel ...	15	40	Rice	7.4	
Smoked ham.	14.6	51.2	Beans	23.2	
Bacon	2.8	85.2	Peas	22.9	
Dried beef ..	27	38			

Having suggested the proper foods, I will state the dietary I have found most valuable in these cases.

I placed the children on a diet consisting of milk (a quart a day) cocoa, eggs, red meat (once a day) fowl, fish, bread and butter, and cereals, such as oatmeal (of which 94 per cent of the nitrogenous matter is proteid), farina, hominy, corn-meal, rice, pure olive-oil, and cream should also be given if possible, with vegetables, such as spinach, stewed tomatoes, stewed corn, cauliflower baked and creamed potatoes, purees of beans or peas, and baked beans, and fresh fruit, such as oranges, pears, apples, raw and baked and in the form of apple sauce, and stewed prunes. The children were ordered to stop school, be out in the open air as much as possible, open the windows at night and air the room thoroughly by day, go to bed at 7 or 8 o'clock and take a rest in bed for an hour or two after the midday meal. Bathing was encouraged for the purpose of cleanliness, and a salt-water bath followed by a vigorous rub for its stimulating and invigorating effect.

It was surprising how rapidly these children improved and gained weight with no other medication than a simple iron tonic. Some gained as much as a pound and a half a week.

A mixed diet, both in animals and in man, is usually taken better and the nutrients are more completely digested and assimilated than when only one food is used. Variety in foods of the same nutritive value stimulates the appetite and prevents the patient from tiring of any special food.

"For the same amount of money the most nutrients can be obtained in the form of milk, wheat flour, corn-meal, oatmeal, sugar, beans and cereals in bulk. Meals furnish proteid in large amounts but they fail to furnish carbohydrates as the vegetables do. It has been found that it takes six to eight pounds of cereals, besides forage crops, to make a pound of meat, consequently animal foods can never compete in cheapness of the nutrients with cereals and vegetables."¹

Vegetables should be given in abundance since the vegetable proteid carries with it a large amount of potassium salts which are the predominating salts in muscles, neutralize acid products and forestall rheumatism. Wheat flour and wheat bread have a high nutritive value, and more nutrients can be obtained in this form for a given sum of money than of any other food, except corn-meal.

Experiments at the agricultural stations show that bread is a very digestible food. Ninety-eight per cent. of the carbohydrate and 88 per cent. of the gluten or proteid are assimilated by the body. These experiments showed that graham and whole wheat flour were not as completely digested and absorbed by the body as white flour, although they contained a greater amount of proteid.

A child is a valuable national asset and its welfare and healthy development is of great importance to the state, which should be legally under obligation to look after it. Children who are starved, through negligence, ignorance, or poverty on the part of the parents should be fed as every child has a right to be fed; there ought to be no such thing as a starving child in our land, especially in the public schools, where children are under the daily observations of their teachers. It should be the public duty to see that such children are provided with nourishing food.

In England, Scotland and France nourishing meals are given in many of the schools at a slight cost, and are paid for by tickets previously purchased by the parents. Many meals are given free. This has been done in a few schools in this country with success. No distinction is made between those who pay for these meals and those who are unable to do so.

Let us remember that the future as well as the present is our concern in considering this great problem. Shall we civilized people allow our poor to be fed and housed worse than our domestic animals? If these horrible conditions are allowed to continue and rob the masses of their vitality, what can we expect the next generation to be? There can be but one answer, one outcome. Look to London's Stepney for the answer.

I want to add this report to the reports of others, who have perhaps had a greater experience than my own or who have looked into this matter further than I have been able to do. It is only by exposing these conditions that we can reach the remedies. If by such publicity beneficent legislation may be brought about our efforts will not have been in vain.

SCISSORS-MAGNET EXTRACTION OF IRON FROM EYEBALL*

EDWARD JACKSON, M.D.

DENVER

Particles of iron or steel may remain embedded deep in the eyeball for long periods without becoming so enclosed or so firmly adherent as to prevent magnet extraction by the ordinary methods. In the lens the development of a traumatic cataract may rather facilitate removal; and particles remain freely suspended in the vitreous for considerable periods, responding to the attraction of the magnet very much as they would immediately after the injury. De Schweinitz¹ has reported cases in which the tip of the Sweet magnet placed at the scleral incision, not introduced within the eye, promptly removed steel from the vitreous in one case in five weeks, and in the other two months after the injury; and in a third case of six months' duration, although the foreign body was not secured on the magnet, subsequent inability to demonstrate it within the eyeball where it had previously been localized by the x-ray, and the subsidence of the retino-chorioiditis it had caused, seemed to justify the assumption that it had been removed. Hirschberg,² speaking of the Schloesser-Edelmann magnet, says, "With it I once extracted a splinter of 27 milligrams which had been for five months embedded in the retina and had already induced siderosis of the globe. The result was permanent and good."

In the series of Knapp and Stoll³ a fragment was extracted through a scleral incision, after repeated trials with a giant magnet had failed to bring it forward, in one case at the end of six weeks, in another after 107 days. In the third case, after four months had elapsed, the foreign body was brought forward with a giant magnet and extracted through the cornea. At the Royal London Ophthalmic Hospital, as reported by McCallan,⁴ foreign bodies were extracted from the depth of the eye (some of them, however, from the lens) after five weeks, seven weeks, six months (three cases), two years and three years.

Operative failures, however, are not so generally reported as successes; and in the literature there is abundant evidence that after a foreign body has been embedded behind the iris and lens for more than one month successful magnet extraction is the exception rather than the rule. McCallan, among 39 cases, most of the patients being treated shortly after injury, gives 4 in which the giant magnet failed to extract the foreign body and indicates definite causes for this failure: "In the first two cases the foreign body was encapsuled and adherent to the ciliary body; in the third case the piece of steel was very large and was firmly lodged in a rent in the sclerotic."

In a case reported by de Schweinitz, although the fragment of steel was large, it could not be drawn from its position in the sclera by a magnet in contact with it. Sweet,⁵ among 57 cases of foreign body in the posterior portion of the eyeball, located by the Roentgen rays, records 6 in which the magnet failed to extract; 5 of the eyes were enucleated and a piece of magnetic iron or steel found embedded in fibroplastic cellular tissues. The periods in which this firm fixation of the fragment

had occurred were, respectively, eighteen years, three years, ten months, three months, five weeks, twelve days and four days. Millikin,⁶ who had to extract such a foreign body with forceps, says: "I do not believe that the magnet has yet been invented that will draw small foreign bodies through tough fibrous tissue."

In the series of Knapp and Stoll,⁷ among 9 cases in which the foreign body was recognized in the vitreous with the ophthalmoscope, the giant magnet failed to extract it in 4 of them; and in 5 other cases in which the foreign body was certainly present, though not visible, there was failure to extract with the magnet. Hirschberg, referring to a series of 64 of his later cases, says: "In 4 cases only of old splinter in the fundus (a small number in my opinion) was I unable to carry out extraction." Haab⁸ gives as the reasons for failure in magnet extraction: 1. "The foreign body was seated too firmly in the back wall of the globe or had pierced it completely. 2. The splinter was seated in the ciliary body at first or was drawn there by mistake. 3. The splinter had produced fibrinous-purulent exudation which, according to my experience, greatly hinders its

Field of vision ten months after operation in Case 1.

movability. 4. The splinter had been healed over in the course of months or years." Snell⁹ says the prospect of saving an eye will be inverse to the interval between the injury and the time when the electro-magnet is employed.

Enough has been said to develop the point that in a considerable proportion of cases the electromagnet, whatever its form and however used, fails to extract pieces of iron capable of magnetic attraction, because they are too firmly embedded in recent exudate or organized tissue. Such cases are sufficiently numerous to make it of interest and importance to consider a method by which some of these eyes may be saved; and such a method I believe we have in the use of scissors held in contact with the magnet while used to set free the foreign body. This is shown by the following cases:

CASE 1.—Fragment of steel in eye over five months. Beginning siderosis. Failure of giant magnet; localization by x-ray. Failure with large hand magnet. Extraction with scissors. Almost full vision.

History.—A. N. A., a man, aged 21, was struck in the left eye, Feb. 26, 1907, by a bit of steel flying from a hammer. His fellow workmen said that a stream of blood came from the wound, and that something must have gone into it. (The accident happened in southern Mexico.) The doctor the patient saw could find nothing in the eye. A cloud appeared in the upper part of the field of vision, but this passed away in about two weeks, and the eye was not badly inflamed. The patient could see perfectly after this. The vision became gradually impaired, however, and had grown more rapidly worse for the last month. He now consulted a competent ophthalmologist, who made repeated trials on each of five different days with a very powerful giant magnet. Each trial caused very severe pain in the lower part of the eye so that he felt very nervous the rest of the day; but it produced no bulging of the iris or other displacement of the foreign body.

Examination.—August 6, 1907, he consulted me. Vision: R. 4/4—; L. 2/100. There was a scar 1 mm. long in the nasal margin of the cornea. No opening was visible in the iris; but in the nasal part of the anterior vitreous was a triangular opacity, and the vitreous generally was hazy. Under atropin the opacity in the vitreous looked almost like detached retina, but was devoid of vessels. Radiograms made by Dr. G. H. Stover showed a very distinct shadow, indicating by the localization method of Sweet, a foreign body 9 mm. back of the center of the cornea, 6 mm. to the nasal side of the median plane, and 4.8 mm. below the horizontal plane.

Operation.—August 8, after the free use of cocaine in crystal, an incision was made in the conjunctiva below the nasal border of the cornea. Then, pushing this aside so that it would give a valvular opening, a meridional incision was made in the sclera, beginning 7 mm. back from the corneal margin and extending 8 mm; the knife, entering 8 mm. in the direction of the foreign body, came into doubtful contact with it; an attempt being made with it to cut both above and below the particle of iron, with a rather free incision in front of it. The tip of the Johnson magnet was introduced twice, as nearly as possible in contact with the fragment. It was seen to drag the eyeball out of shape. When the particle was thus drawn on an attempt was made to seize it with the forceps, but this was unsuccessful. I then introduced scissors with blunt points as near to the foreign body as possible. Then the round end of the core of the magnet was placed in contact with the joint of the scissors, the current was turned on, and five or six distinct short snips were made with the scissors. They were then withdrawn, still in contact with the magnet, and the foreign body found adhering to the blades. It was the shape of an arrow-head 2.5 by 1.7 by 0.7 of a millimeter in size. The operation caused pain and faintness, especially during the first attempts to extract with the magnet; but the pain was not so bad as had been caused by the attempts to extract with the giant magnet. The eye was closed without any suture.

Postoperative History.—At the end of twenty-four hours there was moderate swelling in the parts, but the lines of incision could not be detected. General hyperemia of the globe was moderate; there was no pain. Vision had risen to 3/60, the patient noticing as soon as the eye was uncovered that "things looked much clearer." The general clouding of the vitreous was noticeably less, and in place of the dense opacity large floating shreds of white tissue were seen. The pupil was circular, 7.5 mm. in diameter. The eye was now left open and treated with atropin boric acid collyrium. The next day the hyperemia was less; a fair view of the fundus was obtained. Vision was 2/45. From this time improvement was steady and rapid. On the fifth day vision 4/20 partly, and on the 30th day 4/9 partly. At the end of three months it was 4/5 partly, at which it remains. The patient has finished a course in engineering with drawing and outside office work, without trouble with his eyes. The ophthalmoscope showed a very faint general haze in lower anterior vitreous, with a white scar having pigmented edges 1 disk diameter long and 1/3 disk diameter wide, at the extreme periphery of the fundus. The field of vision taken ten months after the operation is shown in the accompanying figure.

9. Ophthalmoscope, February, 1905.

CASE 2.—*Fragment of steel in the eye three years. Partial traumatic cataract; incipient siderosis. Failure of magnet alone. Scissors-magnet extraction. Preservation of useful vision.*

History.—W. A. H., a man, aged 34, came to me October 18, 1907, at the suggestion of Dr. L. G. Woodson, Birmingham, Ala. Three years previously his left eye had been struck by a small piece of steel. The resulting inflammation lasted about three weeks, but it had not been sore since. During the last two months the vision had been growing worse, although there had been some temporary improvement under treatment.

Examination.—The vision was R. 4/4; L. 4/15. The tension of eyeball was normal. The left iris was discolored, decidedly brownish, as compared with the right. The pupil was a little sluggish as compared with the right, slightly oval, long axis vertical. At the temporal periphery of the iris there was a small coloboma, although the scar in the limbus was not perceptible. The ophthalmoscope showed the right eye normal except that the smaller retinal vessels were slightly irregular in caliber and tortuous. In the left eye there was good fundus reflex in all directions through both the natural and the acquired pupil; but the details of the fundus were not well seen on account of the lens opacity. Under atropin this opacity was found to be net-like in appearance, situated in the deep layers of the posterior cortex, and about the posterior pole of the lens. Through it the larger retinal vessels appeared normal. In the extreme periphery of the fundus, downward and slightly inward, a black mass with a sharp edge projected into the field of view, probably the foreign body. Radiograms, made by Dr. G. H. Stover, gave by Sweet's method of localization, the shadow of a foreign body located 12 mm. back from the center of the cornea, down 9 mm. and to the nasal side of the median plane 4.5 mm., its size appearing to be 2.5 by 0.5 by 0.5 mm.

Operation.—November 20. Under local anesthesia with cocaine crystals an incision was made by lifting the conjunctiva on the point of the knife, dragging it toward the vertical meridian, and making the scleral cut, starting 6 mm. back from the corneal margin, and 4 mm. to the nasal side of the vertical meridian, extending from this point 5 mm. back and slightly toward the nose. There was free bleeding from chorioidal vessels. The tip of the Johnson magnet was introduced twice, first between the lips of the wound, and later in contact with the foreign body. Slight pain was produced when the current was turned on, but there was no dislodgment of the foreign body. The tip of the scissors was then introduced as close as possible to the foreign body. The first time, the current was turned on before the magnet was in contact with the scissors, which were consequently jerked out of the wound. They were reintroduced, the magnet was brought in full contact with the joint of the scissors, and the turning on of the current produced no disturbance in the position of the scissors. About four snips were made with the scissors, which were then withdrawn, still in contact with the magnet, bringing the foreign body away on the tip of the blades. The foreign body was found to be a bit of steel 2.25 by 1.5 by 0.6 mm. in size, entirely covered with rust, except one edge. The bleeding ceased promptly; the pupil was widely dilated. There was some smarting in the eye during the day, but no aching.

Postoperative History.—November 22: There had been no pain. There was moderate ecchymosis. With the ophthalmoscope the black mass was gone from the lower periphery of fundus, and a white area was seen in its place. No hemorrhage was visible. Otherwise the ophthalmoscopic picture was unchanged.

November 27: Vision, L. 4/22, appearance of eye normal, except ecchymosis.

The eye remained entirely quiet after that time. At the end of two months, vision had risen to 4/12 + at which it still remains, without noticeable change in the lens opacity.

In both the above cases I had the counsel and assistance of my colleague, Dr. E. W. Stevens.

My first practical acquaintance with magnet extraction was as an assistant in the attempted removal of a minute fragment of steel, suspended in the vitreous a

little way back of the lens, where it was easily watched with the ophthalmoscope. The approach of the magnet, or the turning on of the current, caused the fragment to be noticeably attracted toward the magnet; and this attraction increased as the magnet was brought nearer, until the tip, being introduced into the vitreous, began to push the vitreous before it, and so caused the entangled splinter to retreat. The attempt to remove the splinter was repeated several times, and always with the same result. The fragment was each time pushed away before the magnet tip until the foreign body became obscured by hemorrhage, and the eye was finally lost by suppuration. The magnet used was a small one. Its attractive force was not sufficient to overcome the resistance of the tissue in which the foreign body was embedded.

In every case successful magnet extraction depends on the sufficiency of the attractive force to overcome the hold of the tissue on the foreign body. Since the attractive force exerted is proportioned to the size of the particle to be extracted, the smaller particles require the use of a more powerful magnet. The giant magnet has the advantage of exerting its maximum power from a greater distance. But for particles embedded in the coats of the eye, or in blood clots, exudate, or organized scar tissue, no magnet yet made, or likely to be placed at our disposal, is sufficient to overcome the resistance which holds the foreign body in its position. After the experience just mentioned it occurred to me that a knife might have been thrust in so far as to make a free passage for the suspended splinter through the vitreous, and that if the blade of the knife were rendered magnetic it could almost certainly be brought in contact with the foreign body. This plan I have tried, however, without success, in a case seen in consultation, in which the foreign body could not be seen, having been long embedded in the ciliary region.

In 1903 our fellow member, Dr. Connor¹⁰ reported the use of a strabismus hook, connected with the giant magnet and introduced through the corneal wound to disentangle a splinter of steel that had become caught in the iris. The same year Mr. Lang¹¹ reported a device consisting of a steel spatula, connected with Haab's magnet by a flexible iron wire cable, to complete the removal of a foreign body drawn into the anterior chamber by the giant magnet. This function is performed by the scissors after the foreign body has been dislodged. But this is obviously different from the use of the magnetic force to direct a cutting instrument to the foreign body, and thus to disentangle and furnish a free passage for a fragment of iron or steel which could not be started, by the magnetic force alone, from the position in which it was embedded.

In the two cases reported the scissors used were curved on the flat and had fine but slightly blunted points. It is important that the contact with the tip of the magnet should be made at the joint of the scissors, where the attraction of the magnet for the scissors will cause little or no interference with the necessary movements for snipping. The scissors should be introduced so that their tips are a very little short of the position of the foreign body; and the magnet tip should be brought in full contact with them and in the proper position before the current is turned on. Then the magnetic attraction will force the intervening tissue

10. Connor, Leartus: The Giant Magnet in Ophthalmic Surgery, THE JOURNAL A. M. A., 1903, xi, 772.

11. Roy. London Ophth. Hosp. Rep. xv, 296.

between the tips of the scissors and hold it there. The snipping first causes the opening of a passage to the foreign body. Later, as the foreign body tends to slip on the blades of the scissors, the repeated cuts divide bands of tissue that tend to retain it. It is conceivable that a fragment of iron or steel might be of such shape as to require to be thus freed on both sides before it could be withdrawn; but generally the movements of the scissors tips will so disturb its position that reintroduction in a somewhat different direction will not be necessary.

THE FAUCIAL TONSILS AND THE TEETH *

G. HUDSON MAKUEN, M.D.

Professor of Defects of Speech in the Philadelphia Polyclinic Hospital and College for Graduates in Medicine, Laryngologist to the Chester Hospital and Consulting Laryngologist to the Roosevelt Hospital, Philadelphia
CHESTER, PA.

I have given my paper the above title, not because it is my purpose to say much about the teeth, but because I desire to emphasize the importance of the tonsils from the standpoint of the dentist. Tonsillar disease is so insidious in its origin that in most instances it goes unrecognized until the damage to the neighboring organs and even to the general health of the patient is almost irreparable. The tonsils and the teeth are alike at least in this one respect, and the time to cure either is before the disease begins. In other words, we do not see our patients early enough to give them the best kind of service. The tonsils and the teeth, on the other hand, are very unlike in respect to their physiologic importance to the human economy. No one questions, I suppose, the value of the teeth and the desirability of perfecting and preserving them in all their functional integrity but the tonsils have fallen into disrepute and they seem scarcely to have justified their right even to existence under any circumstances whatsoever, so that we find some who advocate their wholesale removal whether they are diseased or not. This, however, would seem to be an extremely radical measure for the correction of a great evil. It is too much like advocating the hanging of all men because some men are murderers.

The faucial tonsils differ but slightly, either histologically or functionally, from similar glands in other portions of the body, but their general and applied anatomy may be worthy of a brief description.

The faucial tonsils are situated on either side of the oropharynx between the pillars of the palate, and in their normal condition they are scarcely demonstrable without the aid of an instrument to draw them into view. The normal faucial tonsil varies in size but it is generally not larger than a small almond, which it somewhat resembles in shape. It rests on the fascia of the superior constrictor muscle, which muscle separates it from the large blood vessels and other important structures in the cervical region.

A diseased faucial tonsil is generally more or less hypertrophied in all its parts. It does not necessarily project far into the fauces, but it is often grasped be-

tween the pillars of the palate and the triangular fold, or so-called plica triangularis, by means of which it is held down in its bed in the tonsillar fossa. These submerged tonsils are not, as a rule, obstructive, but they are sometimes very large, extending upward and backward even as far as the Eustachian tube, on which they often press, interfering with the air, and blood circulation of the ear, and causing disturbances of its function.

In addition to the triangular fold which partially covers the inner and anterior portions of the tonsil, the gland is enveloped in a fibrous capsule which separates it from the surrounding tissues and lines the crypts, which extend through the entire gland and open upward into the supratonsillar fossa. The drainage, therefore, of these tonsils is extremely faulty, and the result is that the pent-up secretions become foul-smelling, and exceedingly irritating when once they have been discharged into the mouth, to say nothing of the vast numbers of bacteria which are constantly being absorbed into the general system through the lymphatics and glands of the neck, causing tuberculosis, rheumatism, scarlet fever and other infections and exanthems.

The function of the normal tonsil is still a subject of discussion. We do not know what it is, but this much we do know, that a diseased tonsil is not only a menace to the general health, but a source of local infection to the oral cavity, harmful alike to the mucous membrane lining this cavity and to the teeth which we are striving so hard to preserve.

Diseased faucial tonsils affect the teeth in three ways. First, they interfere with the general health of the patient and thus with the proper nourishment of the teeth. Second, they contribute very largely to the local invasion of the teeth by the numerous bacteria which emanate from their crypts. And, third, they interfere by pressure with the alignment of the teeth and with the normal development of the maxillary bones.

That the general health is impaired by direct infection from, and through, these glands is a fact which has been proved beyond any possibility of doubt. Dr. George B. Wood has shown, in a series of experiments on hogs, that tubercle bacilli of a virulent nature frequently invade the tonsillar tissues in preference to other portions of the throat, and that even an apparently normal tonsil is unable to filter them out. He and others have also shown that the tonsils and lymphatic glands of the neck combine to form a direct route for the invasion even of the contents of the thoracic cavity, such as the pleura and apices of the lungs. Tuberculous glands of the neck and even pulmonary tuberculosis may therefore be traced directly to diseased faucial tonsils; and my own experience has led me to believe that cervical adenitis, whatever may be the specific character of the infection, may, in the great majority of instances, be traced directly either to diseased tonsils or teeth, or to both of these sources combined. Moreover, when we consider the fact that the efferent lymphatics drain into the venous circulation, we have an explanation of the anemia and other symptoms of blood impoverishment which always accompany diseased tonsils and teeth. We have here, therefore, what has been called a "vicious circle." The diseased tonsil, or tooth, transmits its infection through the cervical glands and lymphatics to the circulation, impoverishing the blood which, on its return, fails to nourish the tonsils and teeth properly, and thus disease of these organs is further elaborated and extended.

*Read in the Section on Stomatology of the American Medical Association, at the Sixtieth Annual Session, at Atlantic City, June, 1909.

Furthermore, a diseased faucial tonsil is usually more or less catarrhal in its character and its secretions are often filthy in the extreme. The oropharynx is thus kept more or less bathed in infectious secretions, and the teeth naturally suffer as a result. In a similar way, of course, the normal tonsil may be affected by infectious material from diseased teeth.

The third manner in which the teeth are affected by hypertrophied tonsils is by pressure of the glands on the posterior molars and on the ends of the alveolar arches. So far as I know, this factor in the production of alveolar irregularities has not been referred to in literature, and yet it seems to me to be one of no little importance. These glands are sometimes very large and of firm consistency, and the more or less constant pressure which they exert on the surrounding structures produces marked deformities. I have already referred to the injurious effect of tonsillar pressure on the Eustachian tube, the lumen of which is often so altered as to interfere with the circulation of air in the middle ear, and I need now only to mention, in addition, the marked bowing of the palatal half-arches, the posterior one being crowded backward against the lateral portion of the post pharyngeal wall, interfering with the normal nasal breathing, and the anterior one crowded forward against the molar teeth and their alveolar processes, this latter pressure being alternately increased and diminished by the acts of articulation, mastication and deglutition.

A similar outward bowing of the superior constrictor muscle also takes place, causing pressure, both on the large vessels of the neck, interfering with the blood circulation in all the structures of the head and face, and on the important nerve trunks in this region, causing neuralgias and various trophic changes in the facial and even the cerebral tissues.

The indirect effect of diseased and hypertrophied tonsils on the teeth and their settings, through forced mouth-breathing, has been described fully by numerous observers; and here, by the way, we have another vicious circle. Just where the circle begins is a mooted question, but whether the tonsils cause the mouth-breathing and the resultant dental irregularities, or whether the dental irregularities cause the mouth-breathing and the resultant tonsils, should not concern us so much as the fact that it is obligatory on us as dental and oral surgeons to break in on this vicious circle at as many points as possible and promptly destroy its disastrous cumulative effects.

We can not cure mouth-breathing and its resultant disastrous effects, in all cases, merely by the removal of tonsils and adenoids. When there are dental irregularities which make it impossible, difficult or even a little inconvenient to close the mouth, something more than tonsillectomy and adenoidectomy must be done. And likewise we can not always cure mouth-breathing by making it possible or convenient to close the mouth, but the nasopharyngeal and oropharyngeal cavities must be made free for the passage of the breath currents, else the breathing can not be normal, nor indeed can the dental arches long remain normal, at least in young children.

My plea in this paper, therefore, is for the eradication of all glandular obstructions to the normal development of the teeth and the alveolar arches, prior to any attempt to remedy the structural defects of these organs.

The tonsils, like the teeth, are subject to change and decay. The structural changes of the tonsils are far greater than those of the teeth. Certain portions of them, up to the age of puberty, undergo marked hypertrophy and thus, in some instances, they become very large. In later years, by a process of disintegration or degeneration, it is true, they grow smaller, but except for the ill effects of the pressure, these small and degenerated tonsils, owing to their catarrhal condition, are more harmful than the larger ones, and give rise to more or less trouble during the life of the individual.

It is not good practice, therefore, to wait for the so-called atrophy of large tonsils. An atrophied, like a hypertrophied tonsil, is usually diseased and it bears some resemblance to a diseased tooth, but inasmuch as the tonsil can not, by any possible means, have its original function restored, whatever that function may have been, the only method of dealing with it is to enucleate or extirpate it. No half-way measures will suffice. I should as soon think of leaving the diseased root of a tooth in the mouth as of taking off only a portion of a diseased tonsil. The modern operation, therefore, is tonsillectomy and not tonsillotomy.

SUMMARY

The faucial tonsils and the teeth are in close approximation and they are alike subject to disease or degeneration.

Diseased tonsils and teeth are locally and systemically unhygienic.

Secretions from the tonsils may infect the teeth, and contrariwise, the tonsils may be infected by the teeth.

Diseased tonsils and teeth cause headache, earache and facial neuralgia, and they become a direct source of infection to the glands of the neck and through the efferent lymphatics to the general respiratory and circulatory systems.

Hypertrophied faucial tonsils often become so large as to effect the hearing, the circulation of blood, the nerve supply of the face and head, and the normal development of the alveolar arches.

The teeth serve important purposes, but the exact function of the tonsil has not yet been demonstrated.

The importance of preserving the teeth is fully recognized, but the diseased tonsil is not worth preserving, because it has lost its usefulness and become a menace to the human economy.

The only rational remedy for diseased faucial tonsils is total extirpation.

[THE DISCUSSION ON THIS PAPER WILL APPEAR IN A LATER ISSUE OF THE JOURNAL.]

Doctors, Dogs and Other Detriments.—According to press reports the physician is now to come under the ban in high class apartment houses, with "dogs or cats or children of a tender age." The reasons are two-fold: First, their "signs mar the esthetic appearance" of the building, and second, "there is an almost constant stream of people running in and out of their halls." We bow to the genius of the inventor of the first objection. Regarding the second, as is the case with children, so with practices. There are those of tender age that are not overburdened with callers, as well as more mature ones with "a constant stream of visitors." Why not establish an age line for practices, the reverse of that prevailing in the case of children—say children under eight not admissible, and physicians whose practice exceeds ten callers a day? The advent of an "addition" to cancel the lease in one case; the eleventh patient in one day to cancel that in the other. There is nothing like having a fixed standard.

AMEBIC DYSENTERY

A PRELIMINARY NOTE BASED ON CLINICAL AND PATHOLOGIC STUDIES

GRANVILLE S. HANES, M.D.

Professor of Diseases of the Rectum in the Medical Department of
the University of Louisville
LOUISVILLE, KY.

The subject of amebic dysentery is one that is commanding increasing attention in all tropical and temperate countries. It has not been a great while since it was universally believed that this form of dysentery existed only in tropical countries, except in those cases in which it was imported from the tropics to temperate climates. Many cases, however, have been reported from various sections of temperate countries, and in patients who have never been away from their immediate surroundings. There is, then, no doubt about amebic dysentery having been contracted out of the tropics. Just how this infection could occur is difficult to understand; a theory has been suggested, and is accepted by many, that the cases of infection away from the tropics occurred from eating uncooked tropical fruits on which the amebæ had been imported. There is no one who has established any scientific facts in support of this theory, so it remains altogether problematic. There are cases, however, of amebic dysentery in which the patients did not become infected by eating or handling tropical fruits. My partner, Dr. J. M. Mathews, and I, with our assistant, Dr. C. D. Render, have had a half dozen of such cases under our care in the past few months.

CASE 1.—History.—A young man aged 28, came under our observation last September. He lived in an isolated district in the mountains of this state. He declared that he could scarcely remember having eaten tropical fruits at any time, and especially at any time near that of his infection. The patient did give a history, however, of living in a valley and of drinking water from a well in which surface water finds its way easily when heavy rains have fallen. He was drinking water from this well at the time when he was stricken with dysentery, and he stated that the well was almost overflowing a short time before he was taken ill.

Present Illness.—Last December he was taken suddenly ill with intense cramping pains in the lower portion of his abdomen and a violent diarrhea. His condition grew rapidly worse and it was thought that there was no hope for his life. After four or five weeks he began to improve slowly and during the latter part of the following February and March he could walk around the house. His diarrhea continued, however, and in April he had a relapse in which his condition was even worse than at the time of his first attack. His weight before his first illness was 140 pounds; it was now reduced to 85 pounds. He had periods of improvement and relapse until he came to Louisville during the following September. When he first appeared in our office his general appearance was typical of one in the advanced stages of cancerous disease or tuberculous infection. He was using, and had been for months, opium suppositories for the relief of intense suffering in his rectum and lower portion of his abdomen. Examination revealed, at once, numerous ulcers in the rectum and sigmoid. Scrapings from these ulcers showed myriads of motile amebæ.

CASE 2.—Patient.—A man aged 61 consulted us recently on account of a distressing diarrhea. There was no history of having eaten or handled any kind of tropical fruits. He did not eat raw fruits of any kind and his occupation did not require his handling or being about fruits.

Present Illness.—This patient's condition was quite as bad as that of the young man referred to and the amebæ that were found on examination were as numerous. His infection dates from last September. During the previous months there had

been little or no rain and the water supply in his section of the country was completely exhausted. Water that was acknowledged to be absolutely unfit for drinking purposes was shipped in from the surrounding country and was so used.

Other patients have given similar histories, both as to the abstinence from eating or handling tropical fruits and the impurity of the water supply. I feel confident that the chief source of infection, in the cases of amebic dysentery occurring in this country, is from drinking-water. We have been so thoroughly saturated with the teaching that amebæ are indigenous to the tropical countries only that we can with great difficulty see the plausibility of any opposing arguments. In the tropical countries amebæ are most numerous and active; therefore, amebic dysentery occurs in these countries with the greatest frequency and severity. I am confident that amebæ are indigenous to our own country, but that they are situated in a less favorable environment and are necessarily fewer in number and less vigorous. We would then naturally expect that the disease they produce would be less frequent in its occurrence and less severe in its effect in temperate climates.

DIAGNOSIS

It is well known to those who are at all familiar with this character of work that the diagnosis is almost always made from the microscopic examinations of the material excreted from the bowel, especially the bloody mucus. It is in this material that amebæ are most abundantly found. It is not in every case, however, that we find bloody mucus, and if it were present the amebæ may be very inactive and much more difficult to make out at one time than another. Where there is but little or no mucus the fecal material must be made liquid by adding water until a suitable consistency is obtained for microscopic examination. The specimen now prepared is one that contains but few amebæ, and there can be no difficulty in understanding that when it has been much diluted numerous examinations would most likely reveal negative findings. If it be true that amebæ produce the ulcerations found in the mucous membrane of the intestine in these cases, is it not reasonable to suppose that these ulcers afford the sites of greatest amebic activity? Admitting this, we would expect to find but few amebæ present in a case of amebic dysentery in which there are but few pathologic conditions in the intestine. Only those that were cast off from a very inactive pathologic process would occur in the discharges.

I do not rely on the examinations of the intestinal discharges, but invert the patient and thoroughly scrape the ulcers with a sharp curette. In this way the amebæ will be observed at once if they can be found at all. We have failed only in a few instances to find the amebæ when sought for in this way, and in these cases they were found later, after all treatment had been discontinued for a few days. In the twenty-four cases treated in the last ten months I have not failed in a single instance to observe ulcers in the rectum and sigmoid and from these demonstrated the presence of motile amebæ.

There is no difficulty in making out the presence of any kind of ulceration, or any other pathologic condition, in the mucous membrane of the lower bowel when this method of examination is employed. If the mucous membrane is found to be soiled by any kind of discharges two or three glassfuls of water can be poured through the proctoscope into the rectum and the patient allowed to pass it out at once, after which the examination can be easily made.

I have called attention to the fact that it is often very difficult to find motile amebæ when the patient is under active treatment. In such cases we advise a discontinuance of the treatment for a few days, after which the motile amebæ can be found. Numerous motile amebæ may be found, however, when the patient is being actively treated. Unless the stage is kept warm the amebæ can not be made out. I have often failed to observe them at first, but after the stage had been warmed they were seen in large numbers.

There are numerous individuals, all over the country, who have amebic infection which is not recognized as such. My partner, Dr. J. M. Mathews, says that he is confident he has treated hundreds of such cases in the past and did not recognize the nature of the infection.

Nearly all the cases in which the patients have become emaciated are diagnosed as having cancer or intestinal tuberculosis. A certain percentage continue to grow worse and die; others linger along with periods of improvement and relapse. Careful scientific investigation will reveal the real nature of the disease in all such cases.

TREATMENT

Since this form of dysentery is due to the presence of a parasite located in the lower portion of the alimentary tract it has very naturally been treated both from above and below. No one plan of treatment has, however, been accepted as being far superior to another; and, what is especially peculiar in the treatment of this disease, is the uncertainty that any treatment yet suggested has been successful in effecting a permanent cure. Everyone who has had experience in the treatment of amebic dysentery feels that his patient is very liable to relapse; and, since relapses have been reported to occur from one to five years after treatment, little faith may be had in a permanent cure. When such long periods have elapsed before the symptoms return, however, I think some consideration might be given to the suggestion that reinfection has taken place. There is no argument produced against reinfection, whether the period dating from a supposed cure be long or short, unless the environment of the patient be materially changed.

Diet.—I believe a great mistake is made in restricting the patient's diet too severely, both as to quantity and quality of food. Unless the patient is in the acute stage of the disease his diet should consist of liberal quantities of rich nourishing foods, barring most vegetables, fruits, and sweets. Especially is this true if the patient is anemic and emaciated, as we find this condition so often obtains. The second patient above referred to, who is 61 years of age, was advised to eat a good full meal before any kind of treatment was suggested. He did this, and when he returned to the office he had experienced no discomfort; half of his trouble seemed to have been dissipated. This is one of many similar cases. All of our patients, except for some special reason, are fed liberally.

Rest.—This is, without doubt, a very valuable feature in the treatment of this disease. We had one patient, however, in whom rest in bed was of no value whatever. Rest, of course, is of most service to those who are acutely attacked or much weakened from emaciation. It has often been observed that patients do exceedingly well when they remain quiet, but when they begin to go about and resume business cares they relapse into the former condition.

Dr. W. E. Deeks' speaks of absolutely curing patients in from one to four weeks by what he terms the "rest supportive treatment." He gives a milk diet, with a preliminary dose of castor-oil; the only internal medicine thereafter being heroic doses of bismuth subnitrate, with a few normal saline irrigations if there is much tenesmus. I am strongly of the opinion that he will have a number of relapses if he keeps these patients under observation.

Remedies Administered by Mouth.—Of these agents none have been relied on in any comparison to that of ipecacuanha. While it is held in much less favor than formerly in the temperate countries, it has many ardent supporters, especially in India and Egypt. Sir Patrick Manson² says: "Ipecacuanha does influence amebic dysentery. It perhaps does not kill the ameba, but deprives it of its pathogenic powers. Quinin, opiates, bismuth and all kinds of intestinal antiseptics have been given with uncertain results.

Remedies Administered by Rectal Injections.—Various sedatives have been employed for the relief of pain—flax-seed water with laudanum, starch water with laudanum, etc. A large number of parasiticide injections have been used—bichlorid of mercury, permanganate of potassium, silver nitrate, thymol, boric acid, quinin, etc. The latter has been used more extensively than any other parasiticide injection. None of these agents acts well in all cases. Tannic acid solution and ice water have also been used extensively in this country. Two years ago we had a Philippine soldier under our observation: quinin irrigations had been used through his appendix for months with no favorable results.

Coal-Oil.—Having failed in the employment of various agents recommended I conceived the idea of irrigating the bowel with refined petroleum, commonly known as coal-oil. I had observed that this agent undiluted would kill all varieties of parasites inhabiting the skin surfaces of any animal: so I reasoned that if it could be used in sufficient strength, considering the safety of the tissues, it would probably act as a parasiticide in the case of amebic infection. Not knowing just what effect it would produce on the mucous membrane, etc., I exercised great care in the amount of oil employed at each irrigation. I began with about an ounce in each quart of water and carefully watched for complications: none were manifest, so I began systematically increasing the percentage of coal-oil with each irrigation. I would continue for a while and then cease to increase the amount for several days, and again I would carefully increase the percentage of oil, until finally I was amazed: I would inject four or five ounces of undiluted coal-oil into the bowel with no untoward results whatever. Having lost much of my sense of fear, I began increasing the amount of pure oil at each irrigation, until now I have no hesitancy whatever in injecting a quart or more of undiluted coal-oil through the rectum, or, in cases of appendicostomy, the appendix. We have never had an untoward symptom from its use in any quantity.

I have treated all of our amebic dysentery patients for the past ten months with undiluted coal-oil. The general plan has been first to place the patient in the inverted position and introduce a proctoscope, through which a normal saline solution is poured into the bowel for the purpose of cleansing it of fecal material, mucus,

1. Med. Rec., lxxiv, No. 24.

2. Brit. Med. Jour., Oct. 24, 1909, p. 1253.

necrotic tissue, etc. The patient is allowed sufficient time to return this solution—from one-half hour to an hour and a half. He is again placed in the inverted position, the proctoscope introduced and any amount of oil, from one glassful to a quart or more of undiluted coal-oil, is poured into the bowel; the patient is then requested to remain in the recumbent posture for a half hour or longer.

The inverted position herein referred to is fully described and illustrated in a previous article.³ Since that publication I have done some original work⁴ on the introduction of various instruments into the rectum and sigmoid. In this experimental work I demonstrated, by the introduction of bismuth, etc., that it was not difficult to introduce various solutions along the entire length of the colon, and even beyond the cecum, when the inverted position was employed. No tubes or bougies are necessary. They, in fact, serve to defeat the object sought.

If it is true that the chief focus of infection is in the cecum and ascending colon, in amebic dysentery, there is no other way that parasitocides and astringent solutions can be so easily conveyed to the site of greatest pathologic activity. Of course, it is impossible entirely to cleanse the cecum and ascending colon by preliminary irrigations with plain water or normal saline, so the subsequent irrigation of oil or other parasiticide is necessarily diluted and is, therefore, deprived of the effects of its full force.

All our patients have responded satisfactorily to this treatment with the exception of two; and these have not allowed us to carry out every detail of the treatment. We have advised appendicostomy in these cases, however, and if such a procedure is agreed to the oil will be used through the appendix, as we have done successfully in a number of other cases. Of course, we will keep, so far as it is possible, these patients under observation and note later the results of this plan of treatment.

We are not now prepared to make definite statements as to the influence of coal-oil on the amebæ outside the intestinal tract, but we expect to be able to do so in the future.

Masonic Temple.

The Regeneration of Peripheral Nerves.—F. Karl Walter (Jnang. Dissert., U. Rostock, 1908) gives a summary of the previous work on this subject and especially discusses the work of Bethe and of Cajal. He does not deny the existence of a chemotactic influence, exerted by a degenerating stump, on the outgrowth of nerve fibers. It is thought outgrowth from the central stump does not extend throughout the peripheral stump (thus forming a new nerve fiber) as maintained by Cajal. Sectioned nerve fibers are capable of regenerating, independently of any influence from the central stump, to the axial band-fiber stage of Bethe, or the embryonic nerve fiber stage of Howell and Huber. This is an atypical nerve fiber of embryonic appearance not yet capable of functional activity or of electrical response. Unless connection with the central stump is established, further regeneration ceases and degeneration follows. When united to the central stump a normal functioning nerve fiber results. The new nerve fiber is formed from the neurolemma—the sheath of Schwann—the fibrils from the nuclei, the medullary sheath from the protoplasm. Connection with the central stump immediately after section hastens all stages of regeneration in the peripheral stump.

THE ACCOMMODATION AND DONDERS' CURVE AND THE NEED OF REVISING OUR IDEAS REGARDING THEM

AN EXPERIMENTAL STUDY *

ALEXANDER DUANE, M.D.
NEW YORK

NEED OF REVISING DONDERS' WORK

Of the many invaluable contributions that Donders made to our science certainly one of the most important was his determination of the range of accommodation at different ages. His researches, indeed, all admit to be fundamental. For that very reason we must avoid ascribing to them an exactitude and a validity which they do not possess and which Donders himself did not claim for them.¹ For we must remember that the number of cases utilized by Donders was small and the individual variations that they presented were rather considerable. Thus his estimate that 7 D represents the normal range of accommodation at the age of 30 is based on but five cases, the accommodation of which was found to vary between 6 and 9 D. It is obvious that more numerous observations might have extended these limits in either direction and have given a different value for the mean. Furthermore, the observations of Donders were based on the assumption that his subjects were actually emmetropic—an assumption which, in the absence of precise cycloplegic tests, must be regarded as erroneous for at least some of them.² Finally clinical experience has proved to many of us that in some respects the course of presbyopia runs otherwise than Donders taught.

In view of these facts and of the great practical importance of the subject it seems advisable to extend and check Donders' investigations as fully as possible.

OUR OBSERVATIONS; METHODS EMPLOYED

The observations here detailed, made by Dr. J. B. Thomas and myself, are a contribution in this direction. The plan which we have been pursuing—for our investigations are still unfinished—is to render each patient emmetropic by applying the full correction of his refractive error and then to determine his near point with Prince's rule. This gives the corresponding amount of accommodation in diopters, which, as the patient's far point has been placed at infinity by his glass, evidently represents his full accommodative power.

In carrying out such a plan the following precautions must be observed:

1. The subject must be made really emmetropic, i. e., his refraction must be wholly and accurately corrected. To effect this in our cases the refraction was carefully determined in every one, and a cycloplegic was used in

* Read in the Section on Ophthalmology of the American Medical Association, at the Sixtieth Annual Session, held at Atlantic City, June, 1909.

¹ A preliminary statement of the results here given was presented to the American Ophthalmological Society last summer. This statement, however, being based on insufficient data, was intended to be provisional only, and as a matter of fact contains some inaccuracies.

1. He says: "The deviations [from] the mean course are not particularly great. And still they must undoubtedly in part be ascribed to errors of observation."

2. Thus Donders, speaking of the hyperopia which he believes to develop later in life, says: "I have not infrequently met with this in persons at sixty years of age, who in their youth probably exhibited no Π whatever. This was inferred when they did not before the forty-fifth year of their life, need spectacles in the evening for minute work." As up to the age of forty-five a hyperopia of one or even two D may remain latent, such an inference is not to be relied on. Donders himself admits: "In some a slight degree of [latent] Π may also increase the deviations."

all but a very few under 48 and in some over that age. Special care was taken to determine the astigmatism accurately to within 0.12 D.

2. The subject's vision must be such that he can make the fine distinctions required. We were, therefore, obliged to reject cases of irregular astigmatism, most cases of high myopia and of high astigmatism even when corrected, of amblyopia from any cause, but especially amblyopia associated with any defect of central vision, of poor sight from corneal or lenticular opacities, etc. Persons thus affected can not discriminate between the blurring due to accommodative failure and the blurring due to their naturally defective vision. In general no subject was utilized whose vision was less than 20/20.

3. The full correction being applied, and the eye not under examination being screened, the test object is brought up until it blurs, then withdrawn until it clears, and then carried back and forth several times until we can be sure of the very nearest point where it begins to blur. This will be the near point, and the corresponding amount of accommodation in D, read off from the scale, will give the patient's range.

4. If the near point is closer than 10 cm. a slight error in determining its position will involve an error of one or more D in the value found for the range of accommodation. In such cases, after making the test with the full correction alone, it is well also to make it with this correction combined with a -3.00 or -4.00 D sphere, so as to carry the near point out beyond 10 cm. The value then found for the range must be increased by the amount of this added lens. But it must be noted that the estimate thus obtained is generally too low, and a value found in the ordinary way which does not exceed such estimate by more than one or two D, may be regarded as accurate.

5. If the near point is beyond 40 cm. it must be brought within measurable distance by the addition of a convex glass to the patient's full correction. From the value of the range thus found the strength of this convex addition must, of course, be subtracted. The addition in any case must be as small as possible, for a strong convex glass often brings the near point closer than it should be theoretically, so that the value of the range found with it is too great by a diopter or more. This will not happen if the convex addition is made only just large enough to bring the near point to between 30 and 40 cm.

6. For reasons that will be enlarged on later it is necessary to make repeated tests in the same case in order to discover the subject's accommodative power. This is especially true of young subjects in whom the first test rarely reveals the true range. Because of this fact we have been obliged to exclude a number of observations in which we were able to make the test but once under proper conditions, or in which the subject later exhibited a greater accommodation.

7. We must make sure that the patient tested understands just what is required of him. In particular we must tell him (a) to put forth all his efforts and strain as hard as he can, so as to focus down on the test object at the closest possible point; (b) to be careful to indi-

cate the precise point where the test object begins to blur—not the point where it becomes entirely confused.

8. We must be sure that the patient is physically fit for the test. He must not be incapacitated from exerting his full accommodative power by muscular exhaustion, neurasthenia, or similar causes. In our series of cases we had to reject a number of observations in which the patient exhibited a temporary incapacity thus occasioned.

9. The test object must be satisfactory. None has proved perfectly so for all persons and at all ranges. Donders used a wire optometer and fine print. For most people, however, these two tests, and especially the latter, make the near point appear too close—giving thus an overestimate of the range. After trying various objects—dots in pairs and groups, parallel lines, simple geometric figures, etc.—we found the best test

Fig. 1.—Range of accommodation at different ages. Each dot denotes a separate subject, the position of the dot indicating the subject's age and the amount of his accommodation. Two dots connected by a wavy line mean the same subject at different ages. The near point in all cases was measured from the anterior focus of the eye (i. e., from a point 13 mm. in front of the cornea).

Fig. 2.—Comparison of observations with Donders' curve. AA, curve representing the mean of our observations. (Before the age of 25 and especially before the age of 15, this curve can not be regarded as certainly determined, although it is probably not over 1 D out of the way.) BB, Donders' curve, modified so as to conform to our plan of measurement (from the anterior focus of the eye) and to represent the absolute range and not, as is usually done, the absolute near point—in his cases. CC, represents the upper and DD the lower limits for normal subjects according to our observations.

object³ to be a single engraved black line, 0.2 mm. thick and 3 mm. long, bisecting a dull, white, oblong card which is 3 mm. long and 1.25 mm. wide and is mounted on a disc of black velvet. The moment the line is brought within the near point it blurs (broadens) and then doubles. The line should be so held as to be most clearly seen. Most people see it best when held vertical.

10. The illumination should be suitable. This is a matter of great importance, and lack of attention to it may cause an underestimate of one or more D. The light must be good but not dazzling (diffused daylight is the best), and must come almost straight from behind—over the right shoulder when the right eye is tested and over the left shoulder when the left eye is tested. There must be no shadow on the card which bears the line and no dazzling reflections nor confusing lights beyond it or alongside. For this reason when the test is made with Prince's rule, the latter should be held with its broad side vertical, for if held horizontal the graduations on the rule and the glare from its surface are apt to distract the patient's attention or cause confusion.

11. We must be careful to define the point from which we make our measurement, and take care that we do actually measure from this point each time. Donders measured from the nodal point of the eye, while the tables usually given presuppose a measurement made from the anterior principal point of the eye, i. e., practically from the anterior surface of the cornea. I prefer to measure from the anterior focus of the eye, i. e., from a point 13 mm. in front of the cornea, because this is the point at which we place the convex glass that we use to measure the accommodative power with and to replace the latter when absent. Thus when we speak of a deficiency of accommodation of 6 D we mean one that will be compensated for by a lens of that strength placed at the anterior focus—not at the anterior principal point—of the eye. So, too, when we speak of a hyperopia of 6 D we mean one which is corrected by a convex glass of that strength placed at the anterior focus of the eye. If we shifted the compensating glass to the anterior principal point of the eye we should need one of 6.5 D to accomplish the desired result.

COMPARISON OF OUR RESULTS WITH THOSE OF DONDERS

The values that we found in the range in our cases are plotted in the accompanying diagram (Fig. 1). Each subject is denoted by a separate dot, and the same subject at different ages is denoted by two dots connected by a wavy line. In Figure 2 the broken line, AA, denotes the mean of our observations; the continuous line, BB, the similar curve that Donders constructed from his observations; CC denotes the upper, and DD the lower of the limits between which the great majority of our observations are comprised.

BB, it will be observed, differs from Donders' curve as ordinarily depicted in the text-books in two particulars. In the first place, it rises higher at the start, reaching 18 instead of 14 D. In the second place, it does not touch the base line or O even at the age of 70. The reason for the first difference is that Donders' curve

as ordinarily drawn represents the near point when measured from the anterior principal point of the eye, while, in order to make it comparable with our curve, we had to draw it as if measurement had been made from the same point as for the latter, i. e., the anterior focus of the eye. The second point of difference arises from the fact that Donders' curve as usually drawn shows the absolute position of the near point in his patients, whether they were emmetropic or hyperopic, while, to make it comparable with ours and to show the actual range of accommodation as he found it, we had to change the curve to what it would be if his elderly hyperopic patients were rendered emmetropic by glasses. To do this we had to shift the far point in all his hyperopic cases up to the base line and shift the near point correspondingly upward.

It will be noted that our curve differs from that of Donders in three important particulars:

1. Before the age of 20 our curve falls below his. Here, owing to the comparatively small number of cases and to the difficulty of getting accurate results when the accommodation is high and the patient is young, the results must be regarded as uncertain. Yet we think that the probable error in our findings is not over one D, and that in any case Donders' results for the early ages (10 to 15) are distinctly too high.
2. From 20 to 45 our curve rises above his.
3. From 45 on it falls below his. The difference here is due to the sharp plunge that takes place between 38 and 50.⁴

Both according to our observations and those of Donders the accommodation remains nearly constant after the age of 51, diminishing not more than 0.50 D in ten years. We find a somewhat lower range than Donders did for this time of life.

Hess believes that the accommodation shown in advanced life is in part spurious, the patient being able to see distinctly within his true near point, because his pupil is very narrow and hence has the sharp defining power of a stop or stenopæic aperture. But in a num-

3. Hess recommends Scheiner's test. We have tried this in various modifications, but none has proved satisfactory as a clinical test, that shall be applicable to all sorts of patients, intelligent and otherwise. Moreover, experimenting on myself, I find that the single line, if made fine enough and sharp enough, gives almost precisely the same results as Scheiner's test and is not subject to certain chances of error that inhere in the latter.

4. The fall in accommodation between these ages according to our observations is 4.8 D, or just double the amount found by Donders.

ber of patients that we examined between the ages of 50 and 60 the pupil was fully 3 mm. in diameter, so that Hess' explanation would not account for the range of 1 D or more that these patients showed.

The numerical differences between Donders' observations and ours is shown in Table 1.

NORMAL VARIATIONS IN THE RANGE OF ACCOMMODATION.

What chiefly concerns us as clinicians is not so much the mean value of the accommodation at any given age as the limits within which the accommodation at that age must lie in order to be regarded as normal. A study of Figure 1 shows that the great majority of our cases lie between the limits indicated by the lines CC and DD in Figure 2, i. e., have a range of not more than 20 per cent. below or of 25 per cent. above the mean. The numerical values of these limits for each age are given in Table 3. An accommodation which is persistently above the upper limit or persistently below the lower must be regarded as abnormal. But it can not be so regarded on the strength of a single observation, no matter how aberrant the finding. For such a finding is usually erroneous, the error occurring because:

1. Our method of examination is faulty and, in particular, the test object is unsuitable or the illumination is defective.

2. The patient is inattentive or fails to comprehend what is required of him.

3. Through inertia, laziness or fatigue he fails to exert his full accommodative power.

Owing to these sources of error the same patient when examined at short intervals often shows wide variations—variations which, however, do not mean any real change in his accommodative power.

The usual effect of these sources of error is to make us underestimate the patient's accommodation. Provided we can be sure that the proper conditions are fulfilled, the highest measurement obtained in a series of observations represents the true accommodative power. If, however, this maximum occurs but once, and numerous other observations, made under as good conditions, show a uniformly lower range, we should regard the high finding as probably erroneous.

It is usually the first one or two observations that give the most erroneous findings. This is evidently due to the patient's unfamiliarity with the test and his failure to appreciate just what is expected of him. In any event, it is essential to multiply observations in the same case in order to eliminate error and get at the true result.

If it is thus essential to examine the same patient repeatedly when we wish to determine his individual accommodative power, it is still more essential to multiply observations when we are trying to find the normal average and the normal limits of the accommodation in general. We must examine a great many patients and examine them a great many times and always under the proper conditions and with the proper restrictions. When we do this we find that the accidental variations tend to disappear and the true maxima and minima lie closer to the mean range than we had supposed. The low values, in particular, tend to drop out. It is likely, therefore, that the true limits are not so far apart as indicated in Figure 2 and Table 3, and that a case to be really normal must be well within these limits, and especially must be well above the lower limit.

RANGE IN MYOPIA

Myopia—particularly myopia that has been corrected by glasses—is not regularly associated with a low range of accommodation. Out of thirty cases in which the myopia exceeded 3 D the accommodation was found subnormal in only two. In several cases it was strikingly high; thus:

Dorothy J., aged 18, myopia 12 to 13 D, acc.=12 D.
B. P., aged 18, myopia 4.25 D, acc.=14 D.
F. K. M., aged 13, myopia 7 D, acc.=12 D.
E. C. H., aged 23, myopia 3.75 D, acc.=14 D.
H. P. R., aged 25, myopia 5.50 D, acc.=12 D.
A. E. F., aged 37, myopia 5 D, acc.=8.5 D.

CONCLUSIONS

These may be stated—somewhat dogmatically—as follows:

1. To determine the accommodation we first provide the patient with the glass that fully corrects his refraction. If with this correction his near point lies beyond 40 cm. we add a convex glass of sufficient strength to bring the near point to between 30 and 40 cm. We then

place the patient with his back to a window, turning him so that a good diffuse light comes over the shoulder on the side of the eye we are testing—the other eye, of course, being covered. We now put in the carrier of Prince's rule a dull white card 3 by 1.5 mm. in size, mounted on a dead black surface and having engraved on it a vertical black line, 0.2 mm.⁵ broad and 3 mm. long. The rod itself we place with its proximal end one-half inch from the cornea and with its broad side vertical. We now push the carrier up to the eye, exhorting the patient to focus on the line as hard as he can. When the line blurs we withdraw it until it is distinct, and then carry it back and forth several times until we are sure we have the very nearest point at which the patient can still see it clearly. Marking this point we now read off from the scale the corresponding amount of accommodation in D. From this we subtract the value in D of any convex glass that we may have added to the patient's full correction. The remainder gives the true range. It is necessary to make the test several times, especially in young subjects, getting as many reliable observations as possible. Provided

5. If the patient's vision is not sharp, or if his near point is remote, 0.4 mm.

we can be sure that the patient is intelligent and accurate in his observations, the maximum found in a series of tests represents the real range.

2. If the determination is made in this way the range should be between the limits shown in Table 3.

3. An accommodation which is persistently above or persistently below these limits must be regarded as abnormal—provided always that the proper conditions of examination above noted have been fulfilled.

4. We are not, however, justified in pronouncing the accommodation abnormal on the strength of any single observation.

5. The results above given differ from those of Donders in the manner shown in Figure 2 and in Tables 1 and 2, and particularly in the following points: (a) Before the age of 20 the range is lower than that found by Donders; (b) from 20 to 45 it is higher; (c) from 45 on it is lower.

6. We believe that our results are more reliable than those of Donders because of the following facts:

A. They were obtained from three times as many subjects. Over 500 are shown in the chart, and in making up the statistics 600 have been utilized.

B. Our patients were rendered absolutely emmetropic by glasses, and no subject was utilized in whom the total refraction had not been carefully determined; while it is probable that many of Donders' cases, especially between the ages of 20 and 45, had an uncorrected latent hyperopia, which would make his estimate of the accommodation too low by 1 or 2 D. Hence the fact that our curve rises higher than his during this period.

C. The test object that we use for determining the near point (the fine hair-line and the rule) was better calculated to give accurate results than the tape and wire optometer used by Donders.

7. The idea, still somewhat current, that the accommodation in advanced life becomes zero is in accord neither with Donders' findings nor with ours. A true range of 1 D or over exists up to and beyond the age of 60.

8. Myopes have as good a range of accommodation as emmetropes.

Clinical Notes

ACUTE DILATATION OF STOMACH DURING ANESTHESIA

REPORT OF A CASE

EDWARD L. MOORHEAD, A.M., M.D.
CHICAGO

The following case is reported on account of its rarity:

Operation.—Mrs. Q., aged 22; perineorrhaphy; double salpingo-oöphorectomy; appendicectomy; ether anesthesia, preceded by morphin sulphate grs. 1/4, atropin sulphate grs. 1/120.

Complication.—After repair of the perineum the patient's position was changed to the horizontal, and my assistant was about to give the abdomen its final preparation, when there suddenly appeared a large swelling extending to midway between the umbilicus and pubes, the convex border of the swelling pointing towards the pubes. There was no perceptible change in the pulse or respiration. The abdomen was opened

between the lower border of the swelling and the pubes and the immensely dilated stomach presented. A careful examination failed to elicit the cause. The stomach and intestines were protected by gauze sponges and the operation completed. A stomach-tube was introduced and the swelling gradually disappeared. There was no odor to the gas which passed from the tube, and on washing out the stomach the water came away clear.

Postoperative History.—When the patient was put to bed the pulse was 108 and temperature 99. She reacted nicely and did not vomit that day. The following day gas passed from the bowel and the patient had several slight vomiting spells. About 11 p. m. the stomach again began to dilate, and at 12 p. m. the stomach-tube was again introduced. The morning of the second day the patient's condition was not so good, the pulse being 120 and temperature 99. Normal salt solution was now given per rectum by the drop method and strychnin sulphate, grs. 1/30 every six hours, was ordered. At 10 a. m. on the second day it was necessary to resort to the stomach tube as dilatation again recurred. Eserin salicylate, gr. 1/50, was given at 11 a. m. and at 3 p. m. hypodermatically. On the morning of the third day the bowels moved several times, and from that time on the patient made an uneventful recovery. During the first few days following operation nothing was given by mouth. The patient left the hospital at the end of three weeks and there has been no recurrence of the trouble.

The case is of interest on account of the dilatation coming on at the time it did, without any appreciable cause. There had been no traumatism to the abdominal contents. The work on the perineum was done in a very short time. There was nothing in the stomach (food, etc.) to give rise to the production of gas. Whether the change in position having been a factor in its production is a question.

A CASE OF SYCOSIS, PROBABLY DUE TO THE GONOCOCCUS

EDWARD F. WRIGHT, M.D.
ROYSE CITY, TEXAS

Mr. W., aged 35, weight 165, consulted me Feb. 20, 1909, for pustular folliculitis involving the bearded part of the face, which had existed for two years. The picture was that of an ordinary sycosis. On examining hairs extracted from the infected areas I found in their sheaths, not common pus organism, but great numbers of intercellular and intracellular biscuit-shaped diplococci which were morphologically identical with gonococci. In an examination of the literature I found in Pusey's work a reference to a report by Cronquist of a case of gonococcus folliculitis of the hairy region of the abdomen of a woman who had gonorrhea. Further observations tended to confirm my opinion that the case was one of gonococcus folliculitis. The organisms in my case were rather smaller than the cocci found in the acute stages of gonorrhea, but did not differ from the gonococci found in the prostate in cases of long standing. I found further from my records that the barber had been under treatment for gonorrhea at the time of this patient's infection.

Therapeutics

INCONTINENCE OF URINE IN CHILDREN

This is a frequent and a very troublesome condition, and logically can not be properly treated unless the cause has been determined. Yet how frequently physicians administer drugs for this condition without any investigation into its etiology!

Obviously, the first thing to determine, in a patient presented to the physician with a story of incontinence of urine (which is most generally incontinence only at night), is the condition of the urine. An examination

of the urine will rule in, or out, such causes as nephritis, diabetes, cystitis, and often calculi. An abnormal alkalinity of the urine or an increased acidity may be a factor in the irritation which causes the bladder to contract without due notice. If much mucus and blood are found, with a history of pain referred to the end of the penis in the boy, or to the urethra in the girl, and especially if there is chronic cystitis, such bladder investigations should be made as to prove the presence or absence of calculi.

The rectum, and the vagina in the female, should be carefully investigated for the presence of pin-worms, and if these are present it is not infrequent that in girls they may have invaded the urethra and bladder.

A frequent cause of incontinence is an adherent prepuce, both to the glans in the male and to the clitoris in the female. These conditions can be readily determined. In the boy, if the prepuce is long though not adherent, concretions and deposits of sebaceous material form, which may produce reflex irritation sufficient to cause incontinence.

An actual mild cystitis may be present which may cause the incontinence in the child, while in the adult it would cause only frequent voluntary urination.

Constipation, and feces remaining long in the rectum and sigmoid flexure, may cause pressure on the bladder in children sufficient to render it unable to hold the normal amount of urine.

The abdomen should be carefully examined to exclude any growth that would cause bladder pressure.

A bladder may be congenitally small, or, perhaps more frequently, it becomes contracted, because the urine is so frequently passed that it does not grow or has never grown to its normal size; in other words, the bladder may be contracted.

Nervous conditions, such as chorea, may cause incontinence; and, of course, there is often incontinence during an epileptic attack. Consequently, although epilepsy is not known to be present, in nocturnal incontinence when a tangible cause can not be determined the child should be carefully watched for the possible occurrence of epileptic attacks in the night. It is well known that epileptic attacks may occur in the night in patients in whom epilepsy has never been suspected, and patients who have epilepsy probably frequently have attacks in the night.

The cause may be the more intangible, viz.: the urine may be irritating to the neck of the bladder, or there may be an insufficiency of the bladder sphincter.

Lastly, and by no means infrequently, nocturnal incontinence is because a young child with its bladder of normal size for its age is put to bed at an early hour in the evening and expected to go till morning without urination, which the child's parents could not do. In other words, a child that goes to bed at 6 or 7 o'clock to sleep until 7 o'clock in the morning should be awakened about 11 o'clock to evacuate the bladder.

The general rules for the treatment of incontinence are limitation of the liquids taken during the last hours of the child's day; a bland diet that does not cause indigestion which will cause irritants to reach the bladder in the urine; proper and perfect cleanliness of the genitals; sleeping on a straight, smooth bed that does not sink and bury the child; warm, proper coverings, but not hot and suffocating wrappings; fresh, clean air in the bedroom, and the awakening of the child the last thing before the parents go to bed.

If any of the tangible causes above described have been discovered, the proper treatment for the individual condition, if the condition is curable, will stop the incontinence.

If the urine is found to be alkaline, small doses, proper for the age of the child, of hexamethylenamin (urotropin), or possibly small doses of phenyl salicylate (salol), will render the urine acid and perhaps cure the condition. If, on the other hand, the urine is too acid, the administration of potassium citrate in proper dose, three or four times in twenty-four hours, will reduce the acidity or render the urine alkaline, and the condition will thus be improved.

If there is found to be an adherent prepuce, in the male circumcision may be necessary, or the mere freeing of the adhesion may be all that is needed. In the female, after freeing the prepuce from the clitoris, which may be often done with the fingers alone, the incontinence of urine may cease immediately. It is a fact, however, that incontinence of urine, like any other result of nervous irritation, may be prolonged by the "habit spasm" after the cause has been removed, so that generally a cure of the incontinence can not be expected immediately to follow the removal of the cause.

If there is inflammation of the bladder or even an irritable bladder, a milk and cereal diet, rest in bed, hot water baths and alkaline medication is the treatment.

If it has been decided by injecting boric acid or other bland solution, into the bladder, that it is abnormally small, its increase in size should be encouraged by teaching the child to retain its urine, if possible, more hours while it is awake, and the bladder may thus be educated and developed to retain the night urine longer.

An irritability of the posterior urethra and neck of the bladder is sometimes greatly diminished and incontinence lessened by the administration of atropin. For such purposes the dose should be fairly large, of course depending on the age of the child, and should generally be administered at bedtime, although it may be needed once or twice during the day. If atropin is to do any good, it must be given in sufficient dose almost to cause symptoms of its primary physiologic action, viz., the patient's tolerance should be ascertained. As soon as the atropin causes flushing of the face and drying of the throat it should be stopped for twenty-four hours, and then the dose given should be less than that which caused the symptoms. While atropin is a stimulant to smooth muscle fiber and perhaps tones up the bladder sphincter, it also soothes and dulls the peripheral nerves of the bladder and urethra, perhaps even more than other peripheral nerves, as it is largely excreted in the urine.

If the cause of the incontinence is decided to be an insufficient bladder sphincter, ergot is sometimes excellent treatment. Ergot is a stimulant to smooth muscle fiber and a sedative to the central nervous system, and may thus inhibit bladder reflexes. Sometimes electricity, used locally, has seemed of value in incontinence from such cause, but many more times it fails.

Various hydrotherapeutic measures are sometimes of value. Often, however, when there is this muscular defect, the bed wetting will be continued until puberty, when, by the general development of the genitals, the local muscles also develop and the condition is cured.

Bromids have been given to stop the local irritability and the reflexes which cause the bladder to contract, but they soon produce general debility, and, unless epilepsy is present, are certainly inadvisable.

To give our readers a full report of the legislative proceedings of the annual session, we omit some of our regular departments and curtail the space usually given to others.

THE CAUSE OF EPIDEMIC POLIOMYELITIS

The occurrence during recent years in various places of epidemic poliomyelitis or epidemic infantile paralysis has given impetus to active study by modern means of various phases of this disease. The general features of a number of epidemics have been described, that in this country in 1907 involving about 2,000 cases by Starr¹; that in Sweden, in which more than 1,000 cases occurred, was made the subject of an elaborate monographic study by Wickman,² while the epidemic or series of outbreaks of poliomyelitis in Norway furnished material for an exhaustive investigation of the pathologic anatomy by Harbitz and Scheel.³

According to the latter observers, the principal point of attack is the gray matter of the spinal cord, the poliomyelitis being associated with inflammatory infiltrations in the spinal membranes, and also with more or less strongly marked changes in the medulla and brain, the process being in reality more diffuse than at first thought.

Naturally, attention was early directed to the discovery of the cause of the disease, but, outside of the finding of micrococci in the cerebrospinal fluid in some cases of poliomyelitis, no final results have been reached. It is noted by several observers that during the course of epidemics instances of paralytic diseases would occur among horses, dogs and other animals, but it is wholly problematic whether such instances had any relation to the human disease.

Recently Landsteiner and Popper⁴ claim that they have transmitted the disease to monkeys. They seem to be the first to have attempted to communicate the disease to animals by direct inoculation of supposedly infectious materials from patients, using in their experiments parts of the spinal cord of a boy who died of poliomyelitis, the inoculations of this material emulsified in salt solution being made into the peritoneal cav-

ity of monkeys, rabbits, guinea-pigs and mice. This material was sterile so far as indicated by the results of the microscopic examination and of a large number of culture experiments in blood-broth and serum-broth. Only the two monkeys showed any effects of the inoculations, one (*Cynocephalus hamadryas*) becoming severely ill on the sixth day and dying two days later, the other (*Macacus rhesus*) becoming completely paralytic in the posterior extremities about seventeen days after the inoculation; two days later it was killed. Both these animals showed the lesions typical of poliomyelitis only, other organs than the spinal cord being free from changes. Efforts to communicate the disease to other monkeys with material from the rhesus monkey failed. Landsteiner and Popper conclude that poliomyelitis is communicable to monkeys and suggest that, inasmuch as the material they used in their inoculations seemed to be free from bacteria, the virus of poliomyelitis probably is not demonstrable by the methods usually employed in the study of bacteria and that it may concern a so-called invisible virus or a virus of protozoon nature.

Evidently further experiments are needed, but it seems reasonable to hope, on the basis of the results outlined in the foregoing, that a method has been found by the help of which our knowledge of the cause of poliomyelitis may be advanced.

TUBERCULOSIS A BACTEREMIA

That tubercle bacilli occur in circulating blood under certain conditions has long been known. In 1884 Weichselbaum found them postmortem, especially in the coagulated blood in the heart. Several observers have cultivated the organism directly from the blood in pure growth in acute cases, and the well-known lesions of miliary tuberculosis, diffusely scattered everywhere in the system, is explained as an infection of hematogenous origin due generally to vascular lesions. Generalized distribution of miliary lesions, however, is less common than local lesions in lungs, bones, lymph glands, etc., with little involvement or change in other parts of the body, and the prevailing idea in such instances has been that the bacilli are limited to such foci where they remain or slowly invade the neighboring tissues by direct extension or through the lymphatic vessels. We know such foci occasionally break into blood vessels and especially into the thoracic duct and a shower of tubercle bacilli occurs into the organs, with miliary tuberculosis as a result. At such times the blood necessarily must contain the bacilli, but the conception has been that they do not multiply or remain long in the blood, but are deposited in various organs, especially in the lymphatic glands, lungs, liver, etc.

Recent observations by Rosenberger¹ are of unusual interest in this connection and deserve critical comment. After finding tubercle bacilli in the thoracic duct in 72.7 per cent. of patients dead of tuberculosis and also

1. Amer. Jour. Med. Sci., February, 1909, p. 267.

commonly in the feces, he was led to think that all forms of tuberculosis may be bacteremias, and attempted to demonstrate this by a direct blood examination. The technic for detecting the tubercle bacilli consists in adding 5 c.c. of blood drawn from a vein to an equal quantity of 2 per cent. sodium citrate in normal salt solution. This is well shaken and allowed to sediment in the refrigerator for 24 hours. Smears are made of the sediment, and after drying the film by heat the hemoglobin is removed by water. The preparation is then stained in the ordinary way for tubercle bacilli. In 125 cases examined in various stages of the disease, bacilli in the blood smears were found in all. In some the bacilli were not numerous; in others, especially the acute miliary tuberculosis, clumps of 30 or 40 bacilli were not unusual. Phagocytosis of the circulating bacilli was occasionally observed. Of especial interest is the fact that the bacilli were found in incipient cases, fibroid tuberculosis and laryngeal tuberculosis, as well as in advanced and miliary tuberculosis. Furthermore, they were encountered in cases even before the appearance of the bacilli in the sputum, and hence the method may be valuable for early diagnosis. In this respect the method should be of value also in the diagnosis of suspected miliary tuberculosis, in which cases tuberculin tests are of little or no value.

In confirmation of the work of Rosenberger may be mentioned the results of Forsyth,² who found the bacilli in the blood in all of twelve cases of pulmonary tuberculosis examined, in ten of which physical signs were present in the lungs and tubercle bacilli found in the sputum. Six of these were patients who showed decided and progressive improvement and at the time of the examination had no temperature, showing that the positive findings are not limited to acute advancing tuberculosis.

The morphology of these bacilli appears to be identical with typical tubercle bacilli and, as Forsyth says, if they were seen in sputum no doubt would be entertained as to their identity. The question may be raised as to whether or not they are living and virulent bacilli. In some cases, inoculations into animals gave positive results, but this has not been proved in all cases and further experimental work along this line is needed.

These facts appear to place tuberculosis in the group of bacteremias, a conception which has not generally prevailed in regard to any of the forms of the disease, except possibly acute miliary tuberculosis. This may perhaps alter some of our ideas concerning the distribution of lesions of tuberculosis and will raise certain other questions of interest. If tuberculosis is commonly a bacteremia even in the early stages, it does not seem reasonable to attribute as much importance to lymphatic distribution as is commonly given to it. On the other hand, the bacilli being so numerous and constant in the blood, why do we not more frequently have a

miliary tuberculosis if according to our present conception this condition depends on flooding the circulation with bacilli?

Evidently the miliary distribution must depend on factors other than the mere presence of bacilli in the circulation, among which may be mentioned virulence of the bacilli, resistance of the tissues and possibly the presence of some clumps or masses of tubercle bacilli which, as emboli, may cause lesions, whereas single bacilli in the circulation might not localize.

As Forsyth points out, the relation these facts bear to the use of tuberculin and to the opsonic theory are interesting and may alter some of our present conceptions regarding inoculation.

THE PRESIDENT-ELECT

The Association made a wise choice at the Atlantic City session in selecting as president-elect for the coming year a scientist whose name and work are known throughout the scientific world, a pathologist whose study and research work have placed him in the front rank of his specialty, a teacher of unusual ability, and a man of charming personality, Dr. William Henry Welch of Johns Hopkins University, Baltimore.

He was born in Norfolk, Conn., April 8, 1850, the son of Dr. William Wickham Welch and Emeline Collin. His university education was received at Yale, from which he was graduated in 1870 with the degree of A.B., and his medical studies were undertaken at the College of Physicians and Surgeons, New York City, from which he was graduated in the class of 1875. He took postgraduate work in Strassburg, Leipzig, Breslau, and Berlin from 1876 to 1878 and in 1884 and 1885.

Soon after his return from his first postgraduate trip abroad, he was made professor of pathologic anatomy and general pathology in Bellevue Hospital Medical College, New York City, and held this position from 1879 to 1884, when he became professor of pathology in Johns Hopkins University, Baltimore, a position which he still holds; from 1893 to 1898 he was also the dean of the medical faculty of the university. He has been pathologist of Johns Hopkins Hospital since 1889; president of the Maryland State Board of Health since 1898; president of the board of directors of the Rockefeller Institute for Medical Research since 1901, and a trustee of the Carnegie Institute since 1906. He served as president of the Congress of American Physicians and Surgeons in 1897, of the American Association for the Advancement of Science in 1906 and 1907, of the Association of American Physicians in 1901, and of the Medical and Chirurgical Faculty of Maryland in 1891-1892, and was Huxley lecturer in the Charing Cross Medical School, London, in 1902.

Dr. Welch delivered the Oration on State Medicine before the American Medical Association in 1889, his subject being "Considerations Concerning Some External Sources of Infection in Their Bearing on Preventive

² British Med. Jour., April 24, 1909, p. 1001; abstracted in THE JOURNAL, May 22, 1909, p. 1722.

Medicine." For the last six years he has been a member of the Board of Trustees of the Association.

In 1894 he was given the honorary degree of M.D. by the University of Pennsylvania, and had conferred on him the degree of LL.D. by the Western Reserve University, Cleveland, in the same year. He was given the degree of LL.D. by Yale University in 1896, by Harvard University in 1900, by the University of Toronto in 1903, by Columbia University in 1904, and by Jefferson Medical College, Philadelphia, in 1907.

Dr. Welch has written numerous articles on pathologic and bacteriologic subjects, and also general addresses. Among his more notable literary works are his book on the "General Pathology of Fever," which has been a standard text-book since 1888; "Biology of Bacteria," and "Infection and Immunity," which were published in 1894, and "Bacteriology of Surgical Infections," which appeared in 1895.

The Association is to be congratulated on its choice for president, for it has honored itself in electing Dr. Welch to the position.

Medical News

COLORADO

Graduating Exercises.—The annual commencement exercises of the Denver and Gross College of Medicine, Medical Department of the University of Denver, were held May 13, and a class of 23 was graduated. Diplomas were awarded by Chancellor Henry A. Burhtel, and the doctorate address was delivered by Rabbi William S. Friedman.

Alumni Election.—The Alumni Association of the Denver and Gross College of Medicine, at its annual meeting, May 15, elected the following officers: Honorary president, Dr. Arnold S. Taussig; president, Dr. Carl G. Parsons; vice-presidents, Drs. H. S. Shafer and Miller E. Preston; secretary, Dr. Robert L. Charles; treasurer, Dr. Adam J. Simpson, and historian, Dr. Ida V. Beers, all of Denver.

Deaths for First Quarter of Year.—During the first three months of the year, there were 2,948 deaths reported in the state, equivalent to an annual death rate of 18.80 per 1,000. Of the decedents, 1,774 were male; 1,074, female; 2,861 white and 87 colored. Among the principal causes of death were tuberculosis, 521; pneumonia, 472; violence, 288; nervous diseases, 217; heart diseases, 209; nephritis, 158; and cancer, 109. Scarlet fever caused 51 deaths; whooping cough, 46; influenza, 44; diphtheria, 29; typhoid fever, 24; and measles, 9.

Hospital Notes.—The new Red Cross hospital, established at Salida by Dr. Frank N. Cochems, has just been completed. The building contains accommodation for 65 patients. Work on the new hospital for the treatment of contagious diseases, Denver, is well under way. It is located back of the county hospital, between the Steele Hospital and the old diphtheria hospital, and is connected with these buildings. In the center of the group of buildings will be an administration building, and on either side one-story wings, built at an angle that will insure sunlight to each room. Each wing will contain one ward and two or three rooms for private patients.

CONNECTICUT

Communicable Diseases.—During April, there were reported to the State Board of Health more than 804 cases of measles in 63 towns; 183 cases of scarlet fever in 43 towns; 115 cases of diphtheria in 34 towns; more than 125 cases of whooping cough in 22 towns; 47 cases of typhoid in 16 towns, and 118 cases of tuberculosis in 33 towns.

April Deaths.—There were 1,493 deaths reported during April, or 79 less than in March, 167 more than in April, 1908, and 117 more than the average April number of deaths for the five years preceding. The death rate was equivalent to an annual mortality of 17.3 per 1,000. Of the deaths reported, 16.9 per cent. were due to infectious diseases.

Society Meetings.—At the annual meeting of the Northern Connecticut Medical Society, which includes the towns of Windsor Locks, Enfield, Thompsonville and Suffield, the following officers were elected: President, Dr. Joseph A. Coogan, Windsor Locks; vice-presidents, Drs. Thomas G. Alcorn, Thompsonville, Howard O. Allen, Broadbrook, A. Proctor Sherwin, Suffield, Simon W. Houghton, Hazardville, and Alonzo L. Hurd, Somers, and secretary-treasurer, Dr. Richard A. Outerson, Windsor Locks.—The annual meeting of the Norwich Medical Society was held May 17. Dr. Newton P. Smith was elected president, Dr. Patrick H. Harriman, vice-president, and Dr. Leone F. LaPierre, secretary-treasurer.

Personal.—Dr. William H. Burr, Suffield, has been appointed resident physician at the Miners' State Hospital, Fountain Springs, Pa.—Dr. Thos. F. Kane has been elected president of the board of health of Hartford; Dr. Edward K. Root, a health commissioner; Dr. Charles P. Botsford, superintendent; Dr. Arthur J. Wolff, bacteriologist, and Drs. Alfred M. Rowley, Robert S. Starr and James F. Rooney have been made medical inspectors.—Dr. Edward K. Root has been made a member of the board of medical visitors of the Hartford Retreat.—Dr. Frank A. J. Benedict, Seymour, has been appointed medical examiner for Oxford, vice Dr. Lewis Barnes, deceased.—Dr. James S. Maher, New Haven, has been re-elected president of the board of health.

GEORGIA

Tuberculosis Camp Opened.—Richmond County Tuberculosis Hospital, Augusta, was opened to receive patients, May 17.

Personal.—Dr. Willis F. Westmoreland, Atlanta, has been appointed a member of the commission to investigate the charges against the Georgia State Sanatorium, Milledgeville.—Dr. Ernest A. von Boeckh is reported to be seriously ill at his home in Atlanta.—Dr. Frank L. Eskridge, city physician for the first ward, Atlanta, has resigned, to take effect June 15.—Drs. William C. Pumpelly, Weenes R. Winchester, William F. Carroll and Leighton J. Brown, all of Macon, and Dr. James W. Cowart, Walden, have been appointed members of the Bibb County board of health.—Dr. Isham H. Goss, Athens, has been elected president of the State Board of Medical Examiners.

ILLINOIS

Bequest.—By the will of the late S. E. King, Ottawa, \$40,000 is devised for an annex for Ryburn Hospital.

Personal.—Dr. Robert F. Hayes, Freeport, who fell and fractured his leg several months ago, is now reported to be convalescent.—Dr. George W. Mitchell, first assistant physician at the Peoria State Hospital, Bartonville, has returned from Europe.

Hospital Dedicated.—The dedicatory exercises of St. Margaret's Hospital, Spring Valley, were held June 3. The services were conducted by Bishop O'Reilly of Peoria. The hospital has cost \$30,000, and is in charge of the Daughters of the Mary of the Presentation.

State Hospitals to Change Name.—On July 1, the state hospital for the insane Bartonville, which was first known as the Illinois Hospital for the Incurable Insane, and then as the Illinois General Hospital for the Insane, will be known as the Peoria State Hospital. The other state hospitals for the insane will hereafter be known as the Jacksonville State Hospital, Watertown State Hospital, Kankakee State Hospital and Elgin State Hospital, respectively.

Hospital Notes.—The contract for the hospital for the Naval Training Station, North Chicago, has been awarded to the Noel Construction Company. The building is to cost about \$250,000.—Emanuel Hilb has offered to contribute \$15,000 to a fund to secure a hospital for Rochelle provided a like amount is subscribed by the citizens.—June 5 was "Hospital Tag Day" for the new hospital at De Kalb.—The Galeburg Hospital Association has let the contract for the erection of a wing and annex for \$34,000.

Chicago

Money for Charity.—By the will of the late Henry C. Durand, \$10,000 is bequeathed to the Presbyterian Hospital.

Commencement Exercises.—At the annual commencement exercises of the Northwestern University Medical School, June 9, a class of 170 was graduated. At the alumni banquet, tendered by the faculty, 600 members were present.

Changes in Hospitals.—Plans are under consideration for a six-story addition to Wesley Hospital to cost \$150,000.—Sixty-six hospitals and sanitariums of Chicago have complied with the new ordinance under which hospitals are licensed.

Need of Scarlet Fever Hospital.—Dr. Hyman Cohen of the Department of Health calls attention to the need of a scarlet fever hospital. He states that there are 500 cases of scarlet fever in the city at present, and that quarantining of houses and apartments is not a sufficient step against the spread of the disease.

Personal.—Dr. Filip Kreissl has been appointed attending surgeon to the genitourinary department of the Columbus Hospital. Dr. Oscar C. Willhite, superintendent of the Cook County Institutions, Dunning, has been selected as delegate to the State Conference on Charities. Dr. John T. Binkley has left Chicago for Europe.

Hospital Day.—June 27 and 28 have been tentatively selected as "Hospital Days," which will be devoted to raising funds for various denominational hospitals. Contributions will be taken up on the streets and in churches for this good object. The organization is composed of club women and representatives of about 25 denominational hospitals.

Fraternity Banquet.—At the seventieth annual banquet of the Alpha Omega Alpha Fraternity at the Great Northern Hotel, about fifty members were present. Dr. John M. Dodson was toastmaster. The principal address of the evening was made by Dr. William E. Quine, and was a tribute to the life of Dr. Nicholas Senn, "who did more for humanity and the medical profession than all the other physicians in this great city combined."

To Reduce Infant Mortality.—A campaign has been inaugurated under the supervision of the health department to safeguard infant lives in Chicago during this summer. The milk supply is to receive first attention, and food contamination is to be considered. Nurses are to be provided for children who are seriously ill; medical attention is to be urged for the ailing; mothers will be instructed concerning proper clothing, care and food of children; day nurseries are to be established, and tent hospitals for babies will be provided in the eighth, sixteenth, seventeenth, nineteenth and twenty-ninth wards.

Alumni Elections.—The class of 1899, Rush Medical College, at its tenth annual meeting and dinner, June 2, elected the following officers: President, Dr. Harry C. King, Fort Smith, Ark.; vice-president, Dr. Stephen E. Gavin, Fond du Lac, Wis.; secretary-treasurer, Dr. John B. Ellis, Chicago, and historian, Dr. Benjamin H. Breakstone, Chicago. The annual alumni meeting of the Alumnae Association of the Woman's Medical School of the Northwestern University was held June 7, and the following officers were elected: President, Dr. Eliza H. Root, Chicago; vice-presidents, Drs. Annette S. Mack, Chicago, and Harriet E. Garrison, Dixon; secretary, Dr. Anna Ross Lapham, Chicago; treasurer, Dr. Mary C. Hollister, Chicago; historian, Dr. Anna White Sage, Chicago; and trustees, Drs. Louise Acres, Rachel Hickey Carr and Rose Willard, Chicago. The College of Physicians and Surgeons' Alumni Association, at its annual meeting, June 4, elected the following officers: President, Dr. Charles E. Humiston; vice-presidents, Drs. Calvin W. Harrison and Geoffrey J. Fleming; secretary, Dr. Philip H. Holmes; treasurer, Dr. Clyde D. Pence; necrologist, Dr. Louis J. Mitchell, and member of the executive committee, Dr. Bernard Fantus.

INDIANA

Dispensaries Consolidated.—Plans for consolidating the Indianapolis City Dispensary with the Bobbs Free Dispensary have been completed. They include the opening of a downtown emergency hospital at the State College.

District Society Meetings.—At the annual meeting of the Second District Medical Society, held in Bloomington, May 12, Dr. Henry W. Shirley, Shoals, was elected president; Dr. Thomas N. Braxton, Logansport, vice-president, and Dr. Thomas A. Hays, Burns City, secretary. The next annual meeting will be held at Trinity Springs.

Hospital Notes.—The Indiana Branch of the National Red Cross Society proposes to build open-air movable cottages near Evansville under the auspices of the Vanderburgh County Antituberculosis Association. Six cottages will be built as soon as a location can be secured. The Evansville association has promised to take charge of the colony, and has pledged itself to raise the necessary funds. The Southeastern Hospital Commission has let a contract for four additional cottages to accommodate 225 patients on the hospital grounds near Columbus for \$163,000.

KENTUCKY

Cornerstone Laid.—The cornerstone of the Children's Free Hospital, Louisville, was laid May 15, with impressive ceremonies.

Baptist Sanitarium in Louisville.—The Kentucky Baptist Association has bought for \$44,000 property in Louisville known as the University College and Hospital, on Chestnut street, between Eighth and Ninth, and will spend \$100,000 or more in the establishment and equipment of a sanitarium.

Sanitary Investigation.—Mrs. Caroline Bartlett Crane, Kalamazoo, Mich., is making a tour of the principal cities in the state on invitation of the State Board of Health, investigating from a sanitary standpoint. She has spent a week in Louisville investigating slaughter houses, dairies, milk depots, schools and tenements. As a result of her investigation and of sensational charges said to have been made in her address in Harrodsburg, Dr. W. Horace Witherspoon is said to have filed suit in the Mercer Circuit Court against Mrs. Crane for \$1,995.

Milk Dispensary Opened.—The first milk dispensary of the Babies' Milk Fund Association was opened at Neighborhood House, Louisville, May 17. The object of the association is to provide pure, clean, modified milk for the babies of the poor at a minimum cost, and without expense where applicants are unable to pay. The cost is about 40 per cent. of the total cost of the milk, and the work is supported by voluntary contributions of the public. The association also has an educational department. The association nurse visits the homes of the children and gives practical instruction to mothers in regard to the hygiene of infants. Milk is furnished in individual feeding bottles for a period of twenty-four hours.

LOUISIANA

Ex-Internes Meet.—At the annual meeting of the Charity Hospital Alumni Association, New Orleans, the following officers were elected: President, Dr. Charles N. Chavigny, New Orleans; vice-presidents, Drs. Allen C. Eustis, Abbeville, and W. E. Sistrunk, Lake Charles; secretary, Dr. Lucien H. Landry, New Orleans, and treasurer, Dr. Philip W. Bohne, New Orleans.

Medical Society Organized.—The physicians of East Feliciana parish met in Clinton, May 20, to reorganize the parish medical society, and elected the following officers: President, Dr. Emmett L. Irwin, Clinton; vice-president, Dr. Albert J. Roberts, Olive Branch, and secretary, Dr. Robert P. Jones, Clinton. At the annual meeting of Plaquemines Parish Medical Society, at Pointe a la Hache, Dr. Charles Y. Seagle, Belair, was elected president; Dr. Hewitt L. Ballowe, Burns, vice-president, and Dr. Valery O. Schayot, Pointe a la Hache, secretary-treasurer (re-elected).

MARYLAND

Alumni Election.—At the annual meeting of the Medical Alumni Association of the University of Maryland, held May 31, it was decided not to disband and join the general alumni association. The following officers were elected: President, Dr. William H. Pearce, Baltimore; vice-presidents, Drs. Guy Steele, Cambridge, and Joseph T. Smith and Armenius C. Pole, Baltimore; recording secretary, Dr. Charles E. Sadtler, Baltimore; corresponding secretary, Dr. John Houff, Baltimore, and treasurer, Dr. John I. Pennington, Baltimore.

Baltimore

Cartright Prize Awarded.—Dr. S. O. Mast has been awarded the Cartright prize of \$500 for his thesis on "The Reactions of Lower Organisms to Light."

Must Raise Much Money.—The Johns Hopkins University trustees are about to enter on a vigorous campaign to raise the \$750,000 necessary to avail themselves of the \$250,000 offered by the General Education Board. The university is allowed eighteen months to raise the balance required.

Convicted Unlicensed Practitioner Appeals.—Robert H. Darrah, said to have been convicted on March 17 of practicing medicine without a license, has been sentenced to imprisonment in jail for thirty days, and a fine of \$32.25. An appeal was taken and he was released on a bond of \$1,000. The state's attorney stated that Darrah had been a persistent violator of the law for two years, while the defendant alleges that he was the pupil of a practicing physician.

MICHIGAN

Women Physicians Meet.—At the annual meeting of Blackwell Medical Society, held in Detroit May 19, Dr. Jeanne C. Solis, Ann Arbor, was elected president; Dr. Mary G. Haskins, Detroit, vice-president; Dr. Anna O'Dell, Detroit, secretary-treasurer, and Drs. Lucy J. Utter and Grace M. Clarke, Detroit, councilors.

Alumni Election.—At the annual dinner and meeting of the Detroit College of Medicine Alumni Association, held May 27, the following officers were elected: President, Dr. Richard E. Mercer, Detroit; vice-president, Dr. Ellsworth Mills, Holly; financial secretary, Dr. Frederick Buesser, Detroit, and historian, Dr. Fred W. Robinson, Sturgis.

Against Tuberculosis.—The Bay County Association for the Prevention and Relief of Tuberculosis was organized in Bay City, May 20. Dr. John McLurg was elected first vice-president; Dr. Frank E. Ruggles, secretary; and Dr. John W. Hauxhurst a member of the general committee.—Clinton County Association for the Study and Prevention of Tuberculosis was organized in St. Johns, May 21. Dr. Walter A. Scott was elected president and Dr. Frank C. Dunn, secretary.

MINNESOTA

New Building for State Sanatorium.—The legislature has appropriated \$60,000 for an addition to the main building of the State Sanatorium for Tuberculosis, Walker, and \$15,000 for the building of shacks for outdoor treatment.

Hospital.—St. Lucas Hospital, Faribault, was dedicated with impressive ceremonies May 16, under the auspices of the Evangelical Synod of the district. The building has cost \$80,000, is fire-proof and thoroughly equipped and contains 12 private rooms and a men's ward on the second floor, and on the third floor operating rooms, wards for women and children, and 21 private rooms.

Personal.—Dr. Owen J. Evans has succeeded the late Dr. Allen S. Whetstone as U. S. pension examining surgeon, Minneapolis.—Dr. Archibald E. Wilcox has succeeded Dr. Peter M. Holl, resigned, as superintendent of the Minneapolis City Hospital.—Dr. Edward A. Meyerding, St. Paul, has been appointed medical inspector of public schools.—Dr. George R. Curran, Mankato, first lieutenant and assistant surgeon, Second Infantry, N. G. Minn., has resigned.

MISSOURI

Commencement.—The twenty-eighth annual commencement exercises of the University Medical College, Kansas City, were held May 14, when a class of 47 was graduated. Dr. J. N. McCormack, Bowling Green, Ky., delivered the address to the graduating class.

College Election.—At the annual election of officers of the University Medical College, Kansas City, Dr. Jabez N. Jackson was elected president; Dr. George W. Davis, secretary; Dr. Caleb A. Ritter, treasurer; Dr. Walter M. Cross, member of the board of curators; Dr. Samuel C. James, member of the board of directors, and Dr. John M. Frankenburger, dean of the school, vice Dr. James E. Logan, retired.

Hospital Staff Chosen.—At the annual meeting of the Board of Control of Levering Hospital, Hannibal, the following official appointments of the medical staff were made: Physician in charge, Dr. James N. Baskett; attending surgeon, Dr. Thomas Chowning; consultants, Drs. Charles E. Paxon and Henry L. Banks; attending physician, Dr. Archie L. Shanks; consultants, Drs. John J. Farrell and Richard M. Winn; attending gynecologist, Dr. Elmer E. Waldo; consultants, Drs. William H. Hays and Isaac E. Hill; attending obstetrician and pediatrician, Dr. John J. Bourn; consultants, Drs. Arthur B. Blue and W. Cloy Guss; genitourinary diseases and syphilis, Dr. Richard Schmidt; consultants, Drs. C. E. Vandiver and Edward H. Bounds; pathologist, Dr. Clifton R. Dudley; attending oculist and aurist, Dr. Edward T. Hornback; consultants, Drs. Ulysses S. Smith and James S. Howell, and x-ray specialist, Dr. Isaac E. Hill.

NEBRASKA

Verdict in Favor of Physician.—In the case of Luther Rich versus Dr. Charles C. Allison, Omaha, in which damages of \$10,000 were claimed for the alleged leaving of a drainage tube in the chest following a surgical operation, the judge directed for the defendant May 25, as no evidence was adduced to show that a tube was used in the case.

Hospital Association Meeting.—The health officers of Nebraska met in Omaha, June 7, and organized the Nebraska Health Association, and elected the following officers: President, Dr. Daniel T. Quigley, North Platte; vice-president, Dr. Ralph W. Connell, Omaha; secretary, Dr. George H. Marvel, Aurora, and treasurer, Dr. J. H. Mackey, Norfolk.

Orthopedic Hospital.—The Nebraska Orthopedic Hospital will be located at 42d street and Dewey avenue, on a tract of more than six acres, purchased by the committee. This hos-

pital was authorized by the legislature of 1905, and is designed to provide hospital care for crippled and deformed children of the state, and is intended to take the place of the present hospital which occupies a portion of the Home for the Friendless at Lincoln.

Personnel of Hospital Staff.—The official list of the recently appointed staff of the Douglas County Hospital, Omaha, is as follows: Executive committee: Drs. Frank E. Coulter, Frederick W. Lake and Paul G. Woolley. Consulting staff: Dr. Wilson O. Bridges. Pathology: Dr. Paul G. Woolley. Internal medicine, heads of staff: Drs. William F. Milroy, Paul H. Ludington, Thomas Truelsen, Arthur D. Dunn, Millard Langfeld and Burton W. Christie; assistants, Drs. Rodney W. Bliss, A. C. Petersen, F. McClanahan, and Adolph Sachs. Surgery, heads of staff: Drs. Herschel P. Hamilton, John E. Summers, August F. Jonas, John P. Lord, Arthur C. Stokes and Ernest W. Powell; assistants, Drs. Robert R. Hollister and Samuel R. Hopkins. Gynecology: Drs. Palmer Findley, Ewing Brown and Walter O. Henry. Eye, ear, nose and throat: Drs. Frank S. Owen, Henry B. Lemere, Harry L. Arnold and Louis B. Bushmann. Skin and venereal: Drs. Alfred Schalek, Herbert C. Sumney, John J. Klick and John W. Hellwig. Nervous and mental: Drs. Frank E. Coulter, Joseph M. Aikin, Clement B. Little and H. A. Wigton. Obstetrics: Dr. Alonzo E. Mack, Andrew B. Somers, Charles Rosewater, Mary Strong and Charles W. Pollard. Pediatrics: Drs. Frederick W. Lake and Rudolph Rix. Hygiene and sanitation: Dr. Solon R. Towne.

NEW YORK

New Asylum Named.—Governor Hughes has signed Senator Allis' bill which gives the name of Letchworth Village to the Eastern New York State Custodial Asylum.

Requests to Albany Institutions.—The will of the late Jacob Lowenthal, Albany, bequeaths \$5,000 each to the Albany Hospital and the Albany Hospital for Incurables.

Personal.—Dr. Joseph R. Culklin, Rochester, was operated on May 27, for appendicitis.—Dr. John B. Neary, Troy, has been appointed chief surgeon at the new government hospital, Panama.—Dr. Jesse Crounse, Altamont, who has been seriously ill with septicemia due to an operation wound, is now believed to be convalescent.

Semi-Annual Meeting of Society.—The semi-annual meeting of the Medical Society of the County of Columbia was held at Chatham, May 11. It was announced that the annual meeting of the society would be held in Hudson, October 5, in connection with the meeting of the Third District Branch of the Medical Society of the State of New York.

Alumni Elections.—The following officers of the Alumni Association of the Medical Department of the University of Buffalo were elected May 25: President, Dr. Henry J. Nichols, Bradford, Pa.; vice-presidents, Drs. Marshall Clinton, Buffalo; Charles L. Preisch, Lockport; N. Victoria Chappell, Buffalo; Eugene B. Horton, Niagara Falls; and Edgar A. Forsyth, Buffalo; secretary, Dr. Franklin W. Barrows, Buffalo; treasurer, Dr. Herman K. DeGroat, Buffalo; and trustee, Dr. Albert T. Lytle, Buffalo.—The class of 1899 of the Medical Department of the University of Buffalo, at its annual meeting, May 25, elected the following officers: President, Dr. Charles L. Kelley, Franklinville; secretary, Dr. Dean O. Thompson, Buffalo; and executive committee, the secretary, Dr. Louis J. Beyer, George S. Staniland, New York City, and Francis M. O'Gorman.—At the thirty-sixth annual meeting of the Association of the Alumni of Albany Medical College, May 17, the following officers were elected: President, Dr. Sheldon Voorhees, Auburn; vice-presidents, Drs. Zophar F. Dunning, Philmont; John J. D. McAllister, New York City; Charles Burnstein, Rome; Marshal Latcher, Oneonta, and Christian G. Hacker, Albany; recording secretary, Dr. Jesse M. Mosher, Albany; corresponding secretary, Dr. Andrew MacFarlane, Albany; treasurer, Dr. Robert Babcock, Albany, and historian, Dr. Arthur J. Bedell, Albany.

Tuberculosis Campaign.—The new dispensary for the treatment of incipient cases of tuberculosis was opened in Cohoes, June 2. The work is under the supervision of the health officer, Dr. Albert Mott, and Drs. John Archibald, Joseph C. E. Daunais and William E. Curtin are in charge.—The Rochester Day Camp for the Treatment of Tuberculosis was reopened June 1, under the charge of Drs. J. Raymond Haggman and Edward G. Nugent.—A gift of \$1,000 has been made to the board of health of Watertown, to be used according to the best judgment of the health officer for the check-

ing of the spread of tuberculosis. It is proposed to establish a summer tent colony on the grounds of the State Hospital. —The Albany Chapter of the Red Cross Society has decided to establish a temporary camp for tuberculous patients near the city. The chapter now has about \$2,000 at its command for the establishment and maintenance of the camp.—Dr. Charles E. Townsend, president of the staff of St. Luke's Hospital, Newburgh, has announced that arrangements have been made whereby tuberculosis patients will be examined, instructed, and treated in the hospital, free of charge two afternoons of the week.—A consumptive day camp was opened at Buffalo for its second season, June 1, with thirty patients. Later on accommodation will be provided for fifty. The camp will be under the direction of George H. Eckel.

New York City

Office Building for Physicians.—A new office building, twelve stories in height, to be devoted entirely to offices of physicians and dentists, is to be erected on Joralemon street, Brooklyn, between Court and Clinton streets.

Tuberculosis Hospitals for the City.—Plans have been filed for four four-story buildings for the open air treatment of tuberculosis on North Brother Island. The buildings are to be of concrete, roofed with copper and slate, and will cost \$140,000.

Dermatological Election.—The following officers were elected at the annual meeting of the New York Dermatological Society, May 25: President, Dr. Samuel Sherwell, Brooklyn; secretary and treasurer, Dr. William B. Trimble, and executive committee, Drs. Henry H. Whitehouse, Andrew R. Robinson and George H. Fox.

Personal.—Dr. and Mrs. Walter B. James sailed for Europe June 9. Two days later Dr. James' residence on West 54th street was practically destroyed by fire. The loss was estimated at \$75,000, which does not cover the library, which was one of the best in this country.—Dr. and Mrs. Warren A. James, Dr. and Mrs. James Belden Gere and Dr. Beatrice M. Hinkle have sailed for Europe.

Private Ambulances Must Slow Down.—It has just been decided in Jefferson Market police court that drivers must obey the orders of the traffic police. While the city ordinance gives ambulances the right of way at all times, the charter places the control of street traffic in the hands of the police commissioner. The present decision was rendered necessary because although private ambulances rarely go out on emergency cases they have been dashing about town at top speed.

More Requests for Hebrew Charities.—The will of the late Ernest Ehrmann bequeaths \$5,000 each for the Mount Sinai Hospital, the Montefiore Home for Chronic Invalids and the Beth Israel Hospital. In each instance the bequest is to be devoted to the founding of a bed in perpetuity to be known as the Ernest Ehrmann bed. The testator also left \$10,000 to the Arthur Ehrmann memorial fund in connection with the United Hebrew Charities.

Physicians Graduated.—Fifty-two men and two women graduated June 9 from Cornell Medical School. The address to the graduating class was made by Prof. T. F. Crane, dean of the Cornell faculty, who made a strong plea for a more liberal education as the basis of a medical education.—The Fordam University School of Medicine held its first annual commencement June 1 and conferred the degree of doctor of medicine on eleven candidates. The program included the rectorial address by Rev. Daniel S. Quinn, president of Fordam University, and one by Dr. James J. Walsh on "The Profession for Six Thousand Years."

Plans Consumptive Home.—Believing that there is need of a special establishment in or near New York City where persons of means suffering from tuberculosis can receive treatment under the care of their own physicians and near their friends and business, Mme. Laurence Fiedler, who has already founded a hospital near Paris for poor girls, has started the present movement which has taken definite form in the shape of the Laurent Manor company. It is planned to take part of the earnings of the institution as a sinking fund for the purpose of establishing a free hospital for the treatment of the poor suffering from tuberculosis. The proposed establishment will offer the attractions and the organization of a high class hotel.

Charitable Bequests.—The will of Mrs. Anson G. Phelps, Jr., bequeaths \$10,000 to the Presbyterian Hospital and \$5,000 to the Lincoln Home and Hospital; also \$5,000 to the Tarrytown (N. Y.) Hospital.—According to the will of Mrs. Margaret J. P. Graves, about \$200,000 is to be distributed

among the hospitals of the city. St. Vincent's Hospital is to receive \$25,000; the Society of the New York Hospital, \$10,000; Mount Sinai Hospital, \$10,000; the Presbyterian Hospital, \$10,000 for general purposes and \$10,000 for the maintenance of the emergency ward; the New York Mothers' Home, \$10,000; the New York Infirmary for Women and Children, \$10,000; St. Luke's Hospital, \$20,000 for hospital society work and \$10,000 for the care and treatment of crippled children, and the Society for the Treatment of the Ruptured and Crippled, \$10,000.—The will of Frank J. Walgering leaves about \$81,000 to charitable institutions. Each of the following institutions receives \$5,000: St. Francis' Hospital, St. Francis' Home, St. Vincent's Hospital, Presbyterian Hospital, German Hospital and Dispensary, St. Joseph's Hospital for Consumptives, St. Catherine's Hospital, Brooklyn, and St. Gabriel's Sanitarium for Convalescents in the Adirondacks.

Buffalo

Contagious Disease Pavilion.—The Buffalo General Hospital is constructing a pavilion with a capacity of eight to ten patients for the treatment of patients suffering from communicable diseases.

Anti-Spitting Ordinance.—The Buffalo Health Department is prepared to enforce the anti-spitting ordinance which takes effect July 1. Small yellow cards bearing the words, "You are violating the law against spitting. You are subject to imprisonment or fine, or both. By order of the Health Department," are being prepared for distribution.

PENNSYLVANIA

Personal.—Dr. Otto F. Berrand, Erie, sailed for Europe June 10.—Dr. W. J. Winters, Shenandoah, was thrown from his carriage June 10 and seriously injured.

Jewish Charities.—At the recent annual meeting of the Federation of Jewish Charities it was reported that \$139,300 had been distributed to various charities during the past year. The following were some of the beneficiaries: Jewish Hospital, \$32,300; Jewish Foster Home, \$22,000; United Hebrew Charities, \$34,500; Jewish Maternity, \$9,500; and National Jewish Hospital for Consumptives, \$3,000.

Plans for Sanatoria.—Plans for the new Jewish Sanitarium for Consumptives, to be erected at Eagleville, at a cost of \$35,000, have been submitted. The main building will be the administration building, on each side of which will be an infirmary, one for men and one for women, surrounded by enclosed porches. Near the administration building a dining hall will be provided, and four shacks will be erected, each accommodating eight patients. These buildings will be located on a long slope, each having a different altitude. A new pavilion for tuberculosis patients is being erected at Byberry on the 700-acre tract recently purchased for a new almshouse. This building is being constructed for the accommodation of the city's poor consumptives.

State Tuberculosis Exhibit on Tour.—A new feature in the State Health Department's campaign against tuberculosis has been inaugurated by the health commissioner, who has sent on a tour throughout the state the exhibit which the department made at the recent International Congress on Tuberculosis at Washington. The exhibit consists of models of cottages, open air pavilions and tents in use at the State South Mountain Sanitarium. It includes a large relief map of the sanitarium and land assigned by the legislature to the department of health for sanitarium purposes. There are numerous charts and photographs illustrating the work of the department, and also a model dispensary illustrating how this part of the health department's work is conducted.

Philadelphia

Sanitarium Opened.—The Sanitarium Association of Philadelphia opens its sanitarium at Red Bank, N. J., June 12. This is the thirty-third annual opening of this institution for poor children.

Red Bank Sanitarium Opens.—The thirty-third annual opening of the Sanitarium for Children at Red Bank, N. J., was held at the institution June 12. One thousand children were conveyed from this city to the institution on steamboats. The opening address was delivered by Congressman George D. McCrea, president of the Sanitarium Association.

Portrait for the University of Pennsylvania.—A painting of the late Dr. John S. Dorsey was recently placed in the Medical Hall of the University of Pennsylvania. Dr. Dorsey was professor of materia medica and botany from 1816 to 1818, when he was elected professor of anatomy. He died a few days after his introductory lecture on that subject.

Personal.—Dr. James W. Kennedy was painfully injured in an automobile collision June 9.—Dr. Charles B. Penrose received the honorary degree of LL.D. from the University of Pennsylvania, June 10.—Dr. William C. Gorgas, President of the American Medical Association, received the honorary degree of LL.D. from Jefferson Medical College, June 7.—Drs. Alfred Stengel, Henry Norris and Dr. J. William White have gone to Europe.

Alumni Banquets.—The annual banquet of the Alumni Association of the Jefferson Medical College was held June 7. The following officers were elected: President, Dr. John M. Fisher; corresponding secretary, Dr. James T. Rugh; recording secretary, Dr. S. Mumford; treasurer, Dr. Randle C. Rosenberger, and chairman of the executive committee, Dr. Alfred Heineberg, all of Philadelphia.—The annual banquet of the Alumni Association of Medico-Chirurgical College was held at the Bellevue-Stratford, June 4. The following officers were elected: President, Dr. John H. Egan; secretary and treasurer, Dr. Arthur C. Morgan.

RHODE ISLAND

Personal.—Dr. Reginald Morse, Providence, has been appointed medical missionary, and will take station in India.—Dr. Fred B. Jewett, Howard, has been made superintendent of the State Almshouse, the State Workhouse, and the House of Correction.

Must Keep Register of Tuberculosis.—The Senate and House on April 13, passed concurrently an act providing that the State Board of Health shall keep a register of all cases of laryngeal and pulmonary tuberculosis. This act makes it obligatory on all physicians to report every case of tuberculosis on penalty of a fine of \$10.

VERMONT

New Isolation Hospital.—The aldermen of Rutland have appropriated \$2,500 for an isolation hospital for contagious diseases to be erected near the poor farm.

Personal.—The State Board of Health has appointed Dr. Charles F. Dalton, at present health officer of Burlington, to succeed Dr. Leonard P. Sprague as medicolegal chemist at the state laboratory of hygiene. Dr. Sprague will take up practice in Chateaugay, N. Y.

Meetings.—At the fourth annual session of the Association of Rutland Railroad Surgeons, held in Rutland, the following officers were elected: President, Dr. Clayton W. Bartlett, Bennington; vice-president, Dr. Frank M. Rogers, Alburt; secretary-treasurer, Dr. Stanton S. Eddy, Middlebury; and executive committee, Drs. James S. Hill, Bellows Falls; Clifford A. Pease, Burlington, and M. Richards Crain, Rutland.—Windham Medical Club, at its annual meeting in Bellows Falls, elected Dr. Fred L. Osgood, Townshend, president; Dr. Edward Kirkland, Bellows Falls, secretary, and Dr. James S. Hill, Bellows Falls, treasurer.—At the annual meeting of Franklin County Medical Society, held in St. Albans, May 20, the following officers were elected: President, Dr. Alan Davidson, St. Albans; vice-president, Dr. Charles A. Pratt, Enosburg Falls; secretary-treasurer, Dr. Edwin A. Hyatt, St. Albans; delegates to the state society, Drs. Albert D. Patton, East Fairfield; Arthur O. Morton, St. Albans; and Columbus S. Scofield, Richford, and censors, Drs. Francis W. Norris, Swanton; John Gibson, St. Albans, and Charles G. Abell, Enosburg Falls.

GENERAL NEWS AND COMMENT

Railway Surgeons Meet.—At the second annual convention of the Association of the Atlanta, Birmingham and Atlantic Railroad in Atlanta, May 20, the following officers were elected: President, Dr. Henry B. Disharoon, Roanoke, Ala.; vice-president, Dr. William W. Jarrell, Thomasville, Ga., and secretary, Dr. W. S. Goldsmith, Atlanta (re-elected).

Personal.—Dr. J. P. Perry, chief quarantine officer of the Canal Zone, returned May 18, from an inspection trip to the ports of the north coast of South America, and the islands of the Antilles.—Dr. and Mrs. Paul C. Freer, Manila, left for Europe by way of the Trans-Siberian Railroad, April 10. In the absence of Dr. Freer, Dr. Richard B. Strong assumes the duties of director of the bureau of science and dean of the medical school.—Dr. Fred B. Bowman, Manila, who has been ill with scarlet fever, is improving.

Alumni Meet.—On May 18, the Alumni Society of Harper Hospital, Detroit, was organized and the following officers were elected: Honorary president, Dr. Henry O. Walker, Detroit; president, Dr. Angus McLean, Detroit; vice-presidents,

Drs. Channing W. Barrett, Chicago; Preston M. Hickey, Detroit; and Earl S. Bullock, Silver City, N. M.; secretary-treasurer, Dr. Alexander W. Blain, Detroit; and executive board, Drs. Clark D. Brooks, William G. Hutchinson, Archibald D. McAlpine, and C. P. Clark, all of Detroit.

Leprosy Hospital to Be Erected.—The Hawaiian legislature has made an appropriation of \$40,000 for a leprosy hospital at Kalihi, and plans for the building will soon be ready.

Pension Examiners Meet.—At the annual meeting of the National Association of U. S. Pension Examining Surgeons, held in Atlantic City, the following officers were elected: President, Dr. Henry B. Walter, Harrisburg, Pa.; secretary, Dr. Philip Y. Eisenberg, Norristown, Pa.; treasurer, Dr. Charles H. Glidden, Little Falls, N. Y., and member of the executive committee for three years, Dr. S. Walter Woodyard, Greeneville, Tenn. The association will meet next year in Washington.

Carroll Fund.—The following subscriptions have been received since the last report:

Medical officers of the army.....	\$ 5.00
Escambia County Medical Society, Pensacola, Fla.....	5.12
New York Post-Graduate Hospital Alumni Association...	28.00
Iowa State Medical Society.....	100.00
Richmond County Medical Society, Augusta, Ga.....	15.00
Whitman County Medical Society, Pullman, Wash.....	10.00
Dr. Julius Harold Hurst, Montecito, Cal.....	5.00
"Three Friends," of New York City.....	3.10
Dr. S. Hoberman, Malden, Mass.....	2.00
Students of sophomore and freshman classes of Rush Medical College, Chicago.....	46.00
St. John-St. Charles Bi-Parish Medical Society, Reserve, La.....	5.00

\$ 224.22

Previously reported 5,168.64

Total amount received.....\$5,392.86

The Harvey Society.—The Harvey Society of New York calls the attention of the profession, and of all interested in the development and diffusion of knowledge of the medical and allied biologic sciences, to the permanent value of the lectures delivered under the auspices of the society. To make the work as widely accessible as possible, the council has decided to publish the collected lectures in book form at a price sufficient merely to defray the costs of publication. Two volumes have appeared already, the first containing the lectures of the year 1905-1906, and the second the lectures of 1906-1907. The lectures of 1907-1908 will be issued in a short time, and the volume containing the lectures for the current year is about to go to press. The price per volume is \$2, and permanent subscriptions may be sent to the secretary, Dr. Francis Carter Wood, 437 West Fifty-ninth street, New York City.

FOREIGN

Special Seroreaction in the Blood of the Insane.—Considerable interest has been aroused by the recent announcement of Mueh and Holzmänn that the serum of patients with dementia præcox and manic-depressive insanity constantly inhibits the hemolytic action of cobra venom, while other serums fail to display this property.

Cuban Scientific Commission.—The national board of health of Cuba has organized a special bureau for scientific research on subjects of practical utility for general hygiene. The bureau has been placed in charge of Dr. M. G. Lebrado, hitherto vice-director of the hospital "Las Animas," and one of the editors of the *Revista de Medicina y Cirugia* of Havana.

International Cancer Research.—The Germano-Ibero-American Association at Berlin is obtaining the cooperation of the different Spanish-American countries for the study of cancer, and the Argentine Republic has appointed E. Marino of Buenos Aires as the delegate in charge of the matter in Argentina, thus becoming a member of the International Cancer Research Association.

The Swedish Radium Society.—An association has been formed in Sweden for the purpose of studying radium and exploiting the radium-bearing ores of that country. It has been found that "kolm," a material found in the alum-slate quarries in the province of Westgothland, contains radium, and the association has obtained control of this district, as also of the new patented Helsing process for obtaining uranium and radium from kolm and other ores. The new association is said to be quite large and to include the great physicist, Svante Arrhenius, as one of its leading spirits. Other countries are also investigating their radium-bearing ores. Portugal having found some very encouraging deposits, and similar news comes from Mexico.

International American Congress of Medicine and Hygiene.—The Argentine government and medical profession invite the nations of America to cooperate in an international congress, to open May 25, 1910, the centennial of the birth of the republic. It is to be held at Buenos Aires, and the committee of organization is already actively at work. The official languages are Spanish, English, French and Portuguese, and the members of the profession in the three Americas are urged to cooperate in making the congress a scientific event. The secretary will send bulletins, membership blanks, etc., and special steam and rail rates on request. Address Faculty of Medical Sciences, Buenos Aires, Argentina. An exposition of appliances for hygiene will be made a special feature of the congress, and manufacturers are urged to exhibit.

Appeal for Data on Reinfection with Syphilis.—Prof. A. Neisser of Breslau appeals through the German medical journals to physicians the world around begging them to inform him if they know of any instance in medical practice or in the literature of progressive paralysis in which a reinfection of syphilis occurred with the existing paralysis. He is collecting data to determine whether a positive seroreaction indicates the presence somewhere in the body of a spirochete focus or whether it is merely an indication that the patient has had syphilis at some time in the past. Is it possible, he asks, for persons giving a positive reaction to contract an unmistakable primary sore followed by secondary lesions? True reinfection we know almost never occurs with existing manifestations of syphilis. We also know that the resistance on the part of the skin to renewed infection can not be ascribed to genuine immunity. Apparently all individuals with progressive paralysis give a positive seroreaction, and consequently if paralyses could be found bearing evidences of recent infection along with their psychosis, this would be an important argument in favor of the assumption that a positive reaction may be obtained even in the absence of existing disease or spirochetes.

Foreign Congresses in the Next Few Months.—The Twelfth International Antialcohol Congress is to be held in London the fourth week in July; the Eighth International Tuberculosis Conference at Stockholm the second week, while an interesting meeting of the medical staffs of the hospitals of Germany will be held the same week, probably at Berlin. In August, the Fourth Latin-American Congress will be held in Rio de Janeiro; in the second week of August the Sixth International Psychologic Congress meets at Geneva and the French Congress of Alienists and Neurologists at Nantes. In the third week the Second International Leprosy Conference meets at Bergen, Norway; the fourth week the Fifth International Dental Congress at Berlin. The International Medical, including the International Otiologic Congress, assemble at Budapest, August 29. A number of German congresses are to be held in September, including the Eighty-first *Naturforscher* Congress at Salzburg, the German Public Health Congress to meet at Zurich, and the German Neurologic Congress at Vienna the third week. The Ninth International Veterinary Congress opens at The Hague, September 13. The French hold their national surgical and medical congresses in October. Preparations are already under way for the Third International Congress of School Hygiene at Paris, March 29, 1910, and for the International American Congress of Medicine and Hygiene at Buenos Aires in May, 1910, the centenary of the Independence of the Argentine Republic.

LONDON LETTER

(From Our Regular Correspondent)

LONDON, June 5, 1909.

The International Congress of Applied Chemistry

The Seventh International Congress of Applied Chemistry, which met for the first time in London, was largely attended by chemists from all over the world. All branches of applied chemistry were represented and much of the proceedings was of medical importance. The variations in the strength of preparations of drugs according to the country in which they are prepared, was discussed in the section on pharmaceutical chemistry. The variations were ascribed to two sets of causes—variations in the strength of the roots, leaves, etc., employed and variations in the formulas. A recommendation to the congress to appoint an international committee to investigate the subject and report to the next congress in 1912, was passed. An Austrian chemist recommended the formation of an international commission for the purpose of arriving at uniform methods of testing all drugs.

Australian Institute of Tropical Medicine

An Institute of Tropical Medicine is being founded in Townsville, Queensland, where there is already a large general hospital, the committee of which has undertaken to set apart, free of charge, an isolated building in the grounds for the investigation of tropical diseases, and also to maintain in the wards of the hospital under special observation patients suffering from these diseases. The institute will be controlled by a committee appointed by the Universities of Sydney, Melbourne and Adelaide, and will include one representative of the government of Queensland. Applications are invited for the post of director, who must devote his whole time to organization, research and tuition. The position will carry with it a salary of \$3,000.

The Development of Trypanosomes in Tsetse Flies

Some time ago Dr. Kleine, director of the German organization against sleeping sickness, made the important announcement that the tsetse fly is not a mere vehicle for the carriage of trypanosomes, but that these organisms undergo in it a development analogous to that of the malarial parasite in the mosquito. Sir David Bruce, who is in charge of the Sleeping Sickness Commission in Uganda, has announced to the Royal Society that he has confirmed this observation. He has repeated Dr. Kleine's experiments with the *Trypanosoma gambiense* and *Glossina palpalis*, and also with a trypanosome of the dimorphon type. He has found the flies infective after 16, 19 and 22 days, but not before. It is thought that this discovery has considerable importance with regard to the prophylaxis of sleeping sickness, because once the cycle of development of the trypanosome is completed it may be capable of transmitting infection for long periods, just as the *Stegomyia fasciata* does yellow fever.

Remarkable Indemnity Fund

In 1905 an action for \$10,000 was brought against Mr. Lynn Thomas, the leading surgeon in South Wales, and Mr. W. Skryme, a general practitioner, by a patient who was dissatisfied with the result of the treatment of a fracture-dislocation of the upper end of the humerus. The jury disagreed and the case was again tried in 1906. As it was of considerable interest to the profession, a full report was given in THE JOURNAL of Jan. 5, 1907, p. 61. The plaintiff alleged that Mr. Skryme diagnosed only the dislocation which he wrongly attempted to reduce with his heel in the axilla and put the arm up in a sling. Mr. Thomas was then consulted and recommended that the treatment should be continued. Subsequently, a skiagram was made and showed a transverse fracture of the surgical neck of the humerus with displacement outward of the upper fragment. Union took place in this position with much loss of function. The case attracted great attention from the profession, for most of the leading surgeons of London gave evidence on one side or the other. Mr. Thomas said that he had not recommended the application of a splint because he had known gangrene to follow in a similar case. The jury appears to have been influenced by the evidence for the plaintiff that the treatment laid down in the text-books had not been followed, and awarded the damages of \$500. The low amount appeared to be the result of the fact that the verdict was a compromise between the divergent views of jurymen. The defendants, however, had to pay the costs. Though part of these were borne by the Medical Defence Union, the expenses of the trial were so great that defendants had to pay the large sum of \$15,000. An appeal over the signatures of the leading surgeons of this country, which was subsequently endorsed by eminent foreign surgeons, was made to indemnify the defendants against having to pay a penalty for following other treatment than that laid down in text-books. It was pointed out that the practice of surgery is constantly changing, and that it would be monstrous if progressive surgeons should be made liable for damages every time they adopted a treatment in advance of that laid down in text-books. The appeal was well responded to, sums varying from \$3.50 to \$50 being subscribed. The total amount received was \$9,000. The presentation of the fund will be made at Cardiff, June 4, by M. Lucas-Championnière, president of the International Surgical Society.

The Falling Birth Rate

The annual summary of the registrar-general, just issued, shows that the birth rate of England and Wales in 1908 was 26.5 per 1,000 of the population, being an increase of 0.2 over that of 1907, but a decrease of 1.6 compared with the decennial average.

The Children's Infirmary

The government, which has made a record in its provisions for the care of children, has made another new departure by establishing a children's infirmary at Carshalton in Surrey. Previously, there was no special infirmary for children among the institutions for the poor. The building has been erected at a cost of \$11,500,000, and will be devoted to sick and convalescent children from the workhouses and infirmaries of London. It is anticipated that it will provide accommodation for 1,000 children. Motor ambulances have been provided for patients who can not be conveyed by train. Mr. Burns, president of the local government board, gave an address at the opening ceremony in which he said that nothing was more creditable than the way in which modern society had responded to the call of the child.

PARIS LETTER

(From Our Regular Correspondent)

PARIS, June 3, 1909.

Prize in Naval Medicine

The prize in naval medicine has been awarded to Chastang for his memoir, "The Ear and Detonation; a Clinical and Therapeutic Study."

Congress of Alienists and Neurologists

The nineteenth congress of the alienists and neurologists of France and of French-speaking countries will be held at Nantes, August 2 to 8, under the presidency of Dr. Vallon, head physician of the Asile Ste. Anne, Paris. Three topics, bearing, respectively, on psychiatry ("The *Fugues* in Psychiatry," to be presented by Dr. Victor Parant fils of Toulouse), on neurology ("Chronic Chorea," by Dr. Sainton of Paris), and on legal medicine ("The Insane in the Army from the Medicolegal Point of View," by Drs. Granjux of Paris and Rayneau of Orleans) have been assigned for discussion.

Death of Dr. Bourneville

Dr. Bourneville, physician of the Bicêtre Hospital, has just died, aged 69. He was known especially for his works on abnormal children; he was also the promoter of municipal schools for nurses who are not members of religious orders. He founded the *Progrès médical* in 1873. Of late he had occupied the post of director of the Vallée Foundation, an annex of the Bicêtre for young girls of backward development.

Favoritism and Medical Studies

Even though the laws and regulations allow no one without the bachelor's degree to matriculate at a college of medicine, many students have evaded this requirement through the intervention of influential politicians. This favoritism is now eliciting a strong protest. A few days ago the Corporate Association of Medical Students in Paris organized, under the patronage of the French medical societies, a mass-meeting of protest against favoritism, and addressed to the Minister of Public Instruction a long letter in which some instructive facts are cited. For instance, an Algerian, son of a high dignitary, was permitted through favoritism to begin his medical studies without having taken any secondary studies at all. Physicians and students having protested, the favor was granted at Montpellier, and, to cap the climax, this Algerian was allowed to obtain his medical education at the expense of the state. A veterinary who wished to treat human beings was allowed to dispense with the first two years of medical studies.

The Minister of Public Instruction has now ordered that no student may become a candidate for any of the degrees or honors given by the state in any of the colleges or schools of higher education without placing on deposit the diploma required as a preliminary. Foreign students will be obliged to deposit their original diplomas, along with a translation made by a translator under affidavit. No exception is to be made hereafter.

The Corporate Association of Medical Students has another equally serious complaint, namely, that the provincial colleges, through favoritism, carry some students along without requiring them to attend either lectures or clinics. These phantom students sometimes live so far away that it would be physically impossible for them to be present at classes. For instance, a village schoolmaster was authorized to take a medical course while continuing to teach; he merely went, four times a year, for his quarterly enrolment. A professor in a high school over forty-three miles away from a medical school was allowed to enroll himself at this school without ceasing his duties; and in the same way a pharmacist did likewise, hoping no doubt to extract clinical experience from his phials. Still more re-

markable is the story of the naval pharmacist who was learning medicine on board of an armored cruiser.

Such instances of favoritism are not merely flagrant injustice toward regular medical students and physicians; but a real public danger.

The Number of Medical Students in the French Medical Colleges

The Minister of Public Instruction has just published the statistics of the students enrolled Jan. 15, 1909, in the colleges and schools of higher instruction. Following are the figures for the medical colleges: Paris has 3,576 students; in the provinces, the most important center is Lyons, in which there are 942 students in the mixed college of medicine and pharmacy; the mixed College of Bordeaux has 675 students; the College of Montpellier (medicine alone) has 606 students; the mixed College of Toulouse has 435 students; the College of Nancy has 337; and the mixed College of Lille has 271 students.

Out of the total of 6,842 students, there are 912 foreigners, of whom 559 are Russians, 76 Ottomans, 47 Bulgarians, 42 Roumanians, 20 Greeks, etc. There are only 5 students from the United States, of whom 3 are at Paris.

The total number of women medical students is 689, of whom 294 are French and 395 foreigners.

These figures have to do only with the seven colleges of medicine. Besides these, there are in France two other classes of institutions of medical instruction, namely, the schools of the full practice of medicine, of which there are four, at Algiers, Marseilles, Nantes and Rennes, with a total of 795 students; and preparatory schools of medicine, of which there are 12, with a total of 644 pupils.

The Pierre Budin Foundation

Prof. Pierre Budin, who died two years and a half ago, was the first in France to popularize the infant consultations, where several times a week babies are weighed and carefully examined, and where mothers come to receive valuable instructions. In an excellent work which I have mentioned in a preceding letter, Dr. Ausset of Lille has shown the good influence which these consultations have exercised on infantile mortality (THE JOURNAL, Jan. 23, 1909, lii, 310; see also THE JOURNAL, 1905, xlv, 1033).

Two years ago an association called the Pierre Budin Foundation was formed to honor the memory of the lamented professor and to establish a practical school of puericulture with an infant consultation. This model establishment was opened on May 24, under the presidency of M. Emile Loubet, former president of the French Republic, assisted by M. Paul Strauss, a senator, Professor Landouzy, dean of the college of medicine, M. Mirman, director of charities under the minister of the interior, M. Mesureur, director of the Public Charities of Paris, etc. An ode by Jean Richepin, addressed to Pierre Budin, on the subject of the children of France, closed the program, and the guests were at liberty to admire the perfect equipment of the school of puericulture and the infants' consultation—its garden for the mothers, its sterilizing room, its chemical laboratory, its reception room and weighing room, etc.

BERLIN LETTER

(From Our Regular Correspondent)

BERLIN, May 26, 1909.

Death of Professor Engelmann

Professor Engelmann, formerly director of the physiologic institute of this city, died on May 21, aged 66, from an apopleptic attack caused by arteriosclerosis of the brain. He was chiefly noted for his work on the physiology of the heart, but he was scarcely the equal of his predecessor, Du Bois-Reymond. Professor Rubner, who succeeds Engelmann, gives greater promise of rivalling the activity of Du Bois-Reymond.

Antituberculosis Convention

As usual, the convention instituted by the German central committee for the fight against tuberculosis held its meeting in Berlin in May of this year. The convention consists essentially of the general meeting of the central committee and the session of its executive board and a convention of physicians from the tuberculosis sanatoria. This year there was added a session of the board of directors of the recently founded commission for the campaign against lupus. To begin with the last, the transactions included a report of the work of the

committee to date and an address by Professor Lesser of this city on the modern treatment of lupus with the resulting discussion, the conclusion of which was that the Finsen treatment gives relatively the best results but that it must be supplemented by other methods.

The organization extends over the whole of Germany. The institutions for the campaign against tuberculosis are to be entrusted with the discovery and care of lupus patients. The existing lupus sanatoria are to be provided, where necessary, with the best apparatus possible and above all the necessary capital is to be collected. Including the \$7,500 (30,000 marks) which the German central committee contributes there are at present \$20,000 available. This sum is indeed small for the extensive plans of the association. In the general meeting of the German central committee for the tuberculosis campaign which was held under the presidency of the secretary of state (*Staatssekretär*) von Bethmann-Hollweg it was reported that the receipts of the committee were about \$108,000 of which \$89,000 were derived from a lottery which the government granted permission to the central committee to conduct. About \$40,000 were contributed to sanatoria and tuberculosis institutions. The number of places for intelligence and care has increased to 244. At present there are in Germany 99 public sanatoria for adults with 6,584 beds for men and 3,802 for women. In addition 2,013 beds are available in 34 private institutions. On the average, allowing three months for the occupancy of each bed by one patient, about 52,000 adult patients are treated annually. There are 18 children's sanatoria with 695 beds, and 7,329 beds are available in 79 institutions which exist for scrofulous children and those threatened with tuberculosis. The number of forest convalescent stations has risen to 92 and there are 7 forest schools. The question of disinfection in tuberculosis with especial reference to disinfection of dwellings was taken up. The essential prerequisite of thorough house disinfection, namely, the general requirement of notification of tuberculosis, is lacking in Germany as tuberculosis is not included in the law regarding epidemics. One must therefore be contented with the promotion of voluntary notification; notices are to be sent to the hygienic bureaus for this purpose and the disinfection of dwellings is to be carried out by them. As there are so far no suitable means for disinfection on a small scale, the emphasis must be placed on making the expectoration harmless. The disinfection of linen, especially of handkerchiefs, is important. Dr. Hamel, member of the imperial health office, presented a thorough report regarding the tuberculosis campaign in the United States, especially in New York, and its applicability to German conditions. The reporter made a thorough study of American tuberculosis institutions during his visit to the Washington tuberculosis congress last year. Both the official and voluntary organizations are highly commended. The American sanatoria enjoy a greater popularity than the German.

Fish Poisoning

A young bacteriologist presents in the last number of the *Deutsche medizinische Wochenschrift* an interesting contribution to the question of the origin of fish poisoning, new cases of which will surely be brought to notice with the beginning of hot weather. He has shown the presence of paratyphus bacilli in the ice in which sea-fish were packed for transportation and is of the opinion that the fish may become infected by these bacteria from the ice. He concludes that the usual packing of sea-fish in ice does not prevent the occurrence of fish poisoning and urges that the method of preserving fish be improved. Only natural ice from a source free from infection should be used for packing.

Antivaccination

In spite of the brilliant results which have followed compulsory vaccination in Germany, there exists with us a party, not numerous, but very obstinate, opposed to vaccination, on the ground that it is superfluous, an invasion of the freedom of the individual and dangerous to health. To be sure, there is no doubt that formerly a not inconsiderable injury was produced by vaccination. Many diseases of the skin, probably scrofula, and certainly syphilis, were conveyed by the formerly widespread custom of arm-to-arm vaccination. In preantiseptic times not a few infections occurred from vaccination, so that many a child has lost his life as a victim of the measure. But all these dangers of vaccination have grown constantly fewer and accidental bad results occur rarely at the present time. According to a recently published report on the results of vaccination in Prussia, in 1907, it appears that during that year eleven deaths occurred shortly after the

first vaccination and none after revaccination. Six of these fatal cases had no etiologic relation to vaccination, and the remaining five could not be attributed to any imperfection of the lymph or to faulty technic. One child died from gangrene of the skin around the vaccine vesicles, ten days after the operation; two died from gangrene of the vaccinated area several weeks after the vaccination, and it is probable that the disease arose from subsequent scratching of the vaccine vesicles. In two cases erysipelas was the cause of death. Complications of vaccination with favorable outcome were quite frequently observed. They are generally due to improper treatment of the pustules by the vaccinated or their relatives (rubbing, scratching, washing with a dirty sponge, unclean clothing, etc.). These complications consisted of inflammation and suppuration of the subcutaneous connective tissue, gangrenous changes in the vaccination pustules, suppuration of the neighboring lymph gland, erysipelas, eczema, general eruptions of the skin, appearance of vaccination pustules on other parts of the body (so-called generalized vaccinia) and transmission of pustules to unvaccinated persons. All these complications are greatly exaggerated by the opponents of vaccination and used as propaganda material to secure the repeal of the vaccination law. These efforts of the laity are supported by some physicians (fortunately, only a few). Last April an association of antivaccinationist physicians petitioned the imperial chancellor to appoint a non-partisan commission for the investigation of the question of compulsory vaccination. They complain that in spite of "alarming facts" and in spite of repeated protest from "unnumbered" opponents of vaccination, compulsory vaccination is still constantly enforced in Germany. They attribute the present comparative rarity of smallpox epidemics to modern hygiene; and they hold that the occurrence of over a million tuberculous cases in the German Empire yearly is largely due to compulsory vaccination.

It is not too severe a judgment to characterize an agitation of this sort as conscienceless. The physicians belonging to the executive committee of the association are mostly notorious for their participation in the so-called nature-cure movement and other attempts at quackery. Among them is also Professor Jäger of Stuttgart, the well-known "apostle of wool," and discoverer of the alleged fact, that "the soul can be smelled."

Students' Home at Kiel

At Kiel a few days ago there was laid the corner-stone of a recreation house for students. A building will be erected on a plot of ground which was transferred to the university by the city at cost price, \$48,000, which is to serve as a meeting place for the student body for intellectual recreation and athletics. In a park-like garden, adorned with old trees, on the Kriegshafen, will be placed a building designed as a casino for students and professors, which will contain, in addition to a large banqueting room, assembly rooms, reading rooms and rooms for gymnastics and fencing. In the garden, tennis-courts, race-courses and bowling alleys will be provided. Especial attention will be given to aquatic sports. The cost of construction, including the interior furnishing and exterior parking will be about \$84,000. The expenses will be met by large donations; among others, \$36,000 from the "doctors."

VIENNA LETTER

(From Our Regular Correspondent)

VIENNA, June 5, 1909.

An Accident Clinic in the Allgemeines Krankenhaus

Professor Hohenegg, director of the second surgical clinic, announced to the students that the accident ward, long desired by the leading professors of surgery in this city, has now been granted. This act shows the intimate connection between students and teacher. The two directors of the surgical clinic, who are also the principal teachers of surgery, Hohenegg and von Eiselsberg, will be jointly directors of the new ward. The advantages expected from the new clinic are very considerable from the standpoint of teaching of students. The regular lectures will be able to deal with the cases that come to the practitioner's notice better than heretofore. An agreement has been arrived at with the general first aid society or street ambulance society, the members of which are the first to be called to any case of accident or emergency in this city. This society will erect a branch office in the general hospital and there students and junior surgeons of the clinic will have to serve a term: nurses will be able to receive proper instruction as to the after-care of

injured persons, a point well worth mentioning in view of the low standard of knowledge displayed here by the majority of nurses in this respect. The transportation of injured persons from the place of accident to the hospital will be watched by students as well. Under the system at present in force both clinics had in the last year no more than 49 injuries to show during the ten months of the university year. All the other victims of accidents had to be conveyed according to regulations to the hospital nearest, and, as there are at present minor hospitals nearly in every district, the cases were lost for teaching purposes. The constant decline of the number of such patients was a long-standing grievance to the professors, and, while Billroth had, some twenty-five years ago, more than 300 cases a year, Albert and Gussenbauer, his successors, had to be content with two or three cases a week. The new ward will have 60 beds, with surgical and internal rooms. Arrangements have been made by the army medical corps to enable medical officers of the force to serve there a term of three months to profit from the opportunity thus offered to them.

Pharmacology

"HYDROCYANATE OF IRON—TILDEN"

W. A. Puckner and W. S. Hilpert

[CONTRIBUTION FROM THE CHEMICAL LABORATORY OF THE AMERICAN MEDICAL ASSOCIATION.]

Among the many inquiries received regarding the composition of secret remedies was one in reference to "Hydrocyanate of Iron" manufactured by The Tilden Company, New Lebanon, N. Y. This preparation is advertised as being "unexcelled as a remedy for epilepsy, hysteria, chorea, neurasthenia, locomotor ataxia, neuralgia, migraine, anemic headaches, and all convulsive or reflex neuroses dependent on impairment of the brain or spinal cord." It is also said to be "valuable in uterine reflex neuroses due to congestion; in amenorrhea due to anemia and chlorosis and suppressed menstruation."

The term "hydrocyanate of iron" is an unfamiliar one and is not found in any available reference work on chemistry. Thinking that the term might have been loosely applied to ferrocyanid of iron, or Prussian blue (a compound once suggested for epilepsy, but long ago considered useless), the correspondent wrote to the manufacturers asking if such were the case. The Tilden Company answered:

"... our preparation Hydrocyanate of Iron is not Prussian blue in any sense of the word. Prussian blue has no curative properties as applied to all forms of epilepsy. Prussian blue is Ferrocyanid of Iron while our preparation is Hydrocyanate of Iron."

The only statements in the Tilden Company's advertising matter, regarding the composition of hydrocyanate of iron are the following:

"Hydrocyanate of Iron (Tilden's) is a correct and scientific combination of well known principles."

"Hydrocyanate of Iron (Tilden's) combines well known properties of ferruginous salts with the sedative action of Hydrocyanic acid."

The last statement would lead one to expect the presence of available iron and cyanogen ions. In fact, the inference to be drawn from all the company's "literature" is that "hydrocyanate of iron" is a definite chemical compound in the same sense as is ferrocyanid of iron, and that inference is still further borne out in the letter to our correspondent. This being the case, the Tilden Company was again written to and asked for the chemical formula of "hydrocyanate of iron," with the following result:

"Replying to your inquiry regarding the formula of Hydrocyanate of Iron we beg to state, the composition of this preparation is a trade secret and we therefore do not care to furnish the desired information."

This reply verified the opinion already formed that "hydrocyanate of iron" is a secret preparation. Its analysis was then taken up in the Association's laboratory.

EXAMINATION OF THE TABLETS

The product appears on the market in cartons said to contain one ounce of one-grain tablets. On the cartons, in addition to the name of the preparation and the name and address of the manufacturers, are the names of diseases for which it

is recommended. The tablets, in the specimens analyzed, were dark blue, rather hard and slightly bitter in taste and had an average weight of 0.1382 gm., or about 2 grains. They were found to be practically insoluble in water and dilute mineral acids; aqueous oxalic acid solution partially dissolved them, yielding a blue solution. Boiling with alkali hydroxid solution decomposed the tablets, yielding iron in an insoluble form and a solution of alkali ferrocyanid, as demonstrated by the appearance of a deep blue precipitate on the addition of ferric chlorid solution. The portion insoluble in alkali when boiled with hydrochloric acid yielded a solution containing iron, approximately equivalent to 50 per cent. Prussian blue. These properties are all characteristic of Prussian blue and, taken together, identify Prussian blue as a constituent of "hydrocyanate of iron (Tilden)." The insoluble residue from the iron determination possessed the properties and constituents of talc and constituted practically one-half of the tablets. Extraction of the tablets with chloroform or ether in the presence of ammonium hydroxid yielded a small amount of organic material which contained bodies having the properties of, and responding to tests for, quinin or cinchona alkaloids and caffeine. The presence of a salicylate was also indicated.¹

From the analysis it is concluded that "hydrocyanate of iron (Tilden)" is essentially a mixture of approximately equal parts of talc and Prussian blue, containing traces of organic matter having the general properties of alkaloids.

COMMENT: When a firm exploits an abandoned remedy for so hopeless a disease as epilepsy under a name not known to chemistry and with a false representation of its pharmacologic qualities, such action may rightly be assumed to show ignorance or worse. "Hydrocyanate of iron," if it means anything, means the cyanid of iron, but the preparation put out under that name is, according to our chemists, not cyanid of iron, but the ferrocyanid of iron commonly known as Prussian blue. This substance has been tried for epilepsy and abandoned. Yet the firm recommends it as a "peerless remedy" for this disease. "The Tilden Company holds the key to the situation in the treatment of epilepsy. We have the remedy that does the work."

Not that epilepsy is the only disease for which this hypothetical chemical compound may be prescribed. Torticollis has been "successfully treated with hydrocyanate of iron." In chorea, we are told "a richer and better blood supply" should be furnished the nervous and vascular system and "the irritation of the motor centers" must be allayed.

"Hydrocyanate of iron serves admirably to accomplish both of these purposes. It carries the hemoglobin to the blood in its most easily assimilable form and its hydrocyanic acid possesses remarkable sedative powers. . . ."

It is not possible for it to have any value in anemia because of its insolubility, yet we are told:

"In conditions marked by poverty of the blood producing anemia or chlorosis, reacting on the nervous system and calling for a chalybeate, hydrocyanate of iron (Tilden's) takes a front rank among the remedies of this class, combining as it does the blood enriching qualities of ferrum with the sedative action of hydrocyanic acid."

As Prussian blue yields no appreciable quantity of hydrocyanic acid under the conditions existing in the animal organism, "the sedative action of hydrocyanic acid" must be as hypothetical as the chalybeate properties attributed to it.

It is strange that a manufacturer, in introducing a new chemical compound, should have to assure his customers that it "contains no opium or alkaloid, of that drug, cocain, chloral hydrate, conium or any of the bromids." Imagine a firm putting, let us say, potassium iodid—a definite chemical compound—on the market and solemnly guaranteeing that it contained no cocain or chloral hydrate!

Would the Tilden Company of twenty-five years ago have served such mental pabulum in its advertising matter?

One would think that the dictates of common humanity would protect the unfortunate epileptic from the machinations of the nostrum maker, especially from the exploitation of a remedy that has been tried and found wanting. A nostrum, however, merely has to measure up to one standard: Will it pay? Meeting this requirement nothing else matters.

1. Details of the quantitative analysis of "Hydrocyanate of Iron—Tilden" will appear in the Annual Report of the Chemical Laboratory of the American Medical Association or they may be had on request.

Correspondence

Sir Frederick Treves An Ardent Supporter of Animal Experimentation

To the Editor:—In the *Journal of Zoöphily* for May, 1909, p. 45, is a quotation from an address of Sir Frederick Treves, from which any unsuspecting reader would infer that Sir Frederick is utterly opposed to vivisection. I sent him a copy of that journal and have received in reply the letter which follows this. You observe that he refers to a letter published in the *London Times* on April 18, 1902 [which has appeared in *THE JOURNAL* and in other medical periodicals]. This was noticed editorially in the *British Medical Journal* on April 26, 1902, p. 1042. Inasmuch as the *British Medical Journal* is gone over with a microscope by the antivivisectionists every week, it is impossible that this should have escaped their attention, even if they did not see the original in the *London Times*.

In spite of these facts, this misquotation from Sir Frederick Treves is constantly and glaringly made in the *Journal of Zoöphily*, in some of the publications of the New England Antivivisection Society, and probably in others. Surely seven years after such a disclaimer common honesty would require that these allusions be suppressed.

W. W. KEEN, Philadelphia.

Prof. W. W. Keen:

Dear Sir:—I notice from certain papers sent me from America that the antivivisection party are as active in your country as in mine.

I notice also that the methods which have covered the antivivisection party with contempt and ridicule in this country are being reproduced in America.

In England the improper use of my name has very nearly ceased owing to the persistent circulation of the enclosed letter [the one in the *Times* above referred to.—ED.] and the repeated publication of the fact that I am—as every sane medical man must be—an ardent supporter of vivisection.

The fact that your name has been brought into the matter has led me to trouble you with this letter in the hope that you may be able to make use of it should you consider the matter worthy of notice.

FREDERICK TREVES,
Kingston-on-Thames, Eng.

Old-Age Pensions for Physicians

To the Editor:—I read with interest Dr. Magruder's letter, published in *THE JOURNAL*, May 22, p. 1682, suggesting the establishment of a national home for aged or infirm physicians. Would not a system of old-age pensions be preferable? Many physicians in need of such a retreat as a national home would provide, could not share its advantages because of distance, illness or domestic reasons. I believe that a pension fund placed in the keeping of a board composed of successful business men, or some trust company, the income from this fund to be paid to such worthy physicians as are in need by reason of old age, illness or accident is what we need.

C. BUSEY, M.D., Clearwater, Idaho.

Congregational Practice and Contract Practice

To the Editor:—Several press reports of my paper on "Congregational Practice," read by title before the American Academy of Medicine, tend to convey the idea that I favor the ordinary form of contract practice. Without anticipating the publication of the paper, I may say that it proposes a much broader scope of professional service, which would be put into execution only by a gradual development of professional and public opinion, the basis of payment being only one of the details. Ordinary contract practice starts with a false conception of the value of services and usually involves *bad faith* both as to demand and fulfillment.

A. L. BUNEDICT, Buffalo, N. Y.

Miscellany

THE MIDWIVES OF BALTIMORE

A Report to the Medical and Chirurgical Faculty of Maryland

MARY SHERWOOD, M.D., BALTIMORE

The Evening Dispensary for Working Women and Girls of Baltimore, in cooperation with the Mothers' Relief Society, organized three years ago an obstetric service which cares for indigent parturient women in their homes. Early in this service it was learned that the conditions of the practice of midwives in Baltimore city are, in the light of twentieth century medicine, well-nigh intolerable.

The investigation of the midwives of New York made by Miss Crowell under the auspices of the Public Health Committee of the Association of Neighborhood Workers in 1906 (*Charities and the Commons*, Jan. 12, 1907; abstracted in *THE JOURNAL*, Feb. 23, 1907, p. 712), with the legislation resulting therefrom, suggested a similar study in Baltimore as a basis for asking for legislation on the practice of midwives in Maryland. A special fund for this purpose was contributed to the organizations named by lay women who in their social and philanthropic work had been impressed by the conditions surrounding childbirth among the poor. A committee, consisting of Dr. Lillian Welsh, Dr. Elizabeth Hurdon, and myself, was appointed to direct the work.

The committee has had the cordial cooperation and active assistance of the health department in making this study. It was fortunate in securing the services of Miss Alice H. Small, a trained social worker, to undertake the actual investigation.

Miss Small has personally interviewed the 150 midwives in active practice in the City of Baltimore. The facts she has obtained have been tabulated in a form similar to the tables given in Miss Crowell's report. While our investigation was in progress a report on the midwives of Chicago was published in *THE JOURNAL* of the American Medical Association (April 25, 1908, 1, 1346). These two reports, with ours, give data for an interesting summary and comparison of the conditions of midwifery practice tolerated in three large American cities.

The committee desires to place before the faculty the following facts brought out in our investigation:

1. More than one-third of the births reported at the Health Department are reported by midwives. During the period covered by our tables the percentage of all births reported by midwives was 40.7.

2. There is no adequate registration of midwives, as the law making registration compulsory has no clause providing for notification of change of address; the only knowledge of such change is gained by birth certificates. The registration called for by the health department preliminary to our investigation was the first for many years.

3. No qualifications are required for registration as a midwife. Any one may qualify with no questions asked. Of the 150 included in our tables, 42 (28 per cent.) had foreign diplomas; 9 had American diplomas—worthless as indicating any adequate training; 99 (66 per cent.) gave no evidence of training of any kind. Thirty-seven (24.7 per cent.) could neither read nor write. Twenty-five (16.7 per cent.) could not speak English. In Chicago there is practically no illiteracy, and in New York the percentage is much lower than in Baltimore. The large number of negroes in our number accounts for the high percentage here.

4. There is absolutely no supervision of the work of these midwives. The one law relating to the practice of midwives, secured by this faculty largely through the efforts of Dr. Hirma Woods, provides a penalty for neglect of attention to the eyes, yet an analysis of their practice shows that 3 only out of 150 use a weak solution of nitrate of silver for the eyes, while the remainder use anything from breast-milk to bichlorid of mercury of unknown strength. Sixty-six per cent. care for abnormal cases; they perform version and remove the delayed placenta by internal manipulation. Of the bags examined 41 were found to be clean and in good order; 51 were dirty; 44 midwives had none. A very small number use antiseptics for the hands and sterilized tape for the cord. On account of lack of supervision even well-trained

midwives take no precautions to insure asepsis. One foreign midwife showed a sterilizing apparatus required in her native country, whose use in her adopted country would, she said, expose her to ridicule.

The practice of midwives has been controlled in France since 1803; in Austria, Norway and Sweden, since 1810; in Belgium since 1818; in Russia and in Prussia for many years. Finally, after a long and bitter controversy, Great Britain has adopted and put in operation (1903) an act establishing a "statutory certified midwife."

This report is presented to the Medical and Chirurgical Faculty of Maryland in the hope that it will take the initiative in a movement to secure the better training of midwives and to regulate their practice in the City of Baltimore and the State of Maryland.

Some Fallacies in the Care and Treatment of Children.—In summing up this subject, Dr. H. W. Cheney (*Quarterly Bulletin of Northwestern University Medical School*, March, 1909) gives the following pithy advice:

Don't put a flaxseed poultice or a clay mixture on the child whose breathing is already embarrassed.

Don't allow the filthy "baby comforter" in your presence without a protest.

Don't blame the baby's teeth for a disease you do not take the trouble to find.

Don't be afraid of fresh flowing air for children at all times.

Don't forget to examine the new-born babe and circumsise if necessary.

Don't prescribe medicine when other measures are better—and have the courage to tell your patients so.

Railroad Accidents.—According to Accident Bulletin No. 30, of the Interstate Commerce Commission, the number of persons killed in train accidents during October, November and December, 1908, was 184, and of injured 2,924. Accidents of other kinds—employés killed at work, passengers getting on and off cars, etc.—bring the total number of casualties up to 17,644 (798 killed and 16,846 injured). The number of passengers killed in collisions and derailments, namely 34, is only two-thirds as large as in the last preceding quarter, and if those killed in one case under very unusual circumstances be deducted, the number is reduced to 21, or exactly the same as one year ago. The total number of collisions and derailments in the quarter now under review was 2,684 (collisions 1,373, derailments 1,311) of which 206 collisions and 130 derailments affected passenger trains.

Human Muscular Activity and Pulse Rate.—T. A. Aulo (*Skandin. Arch. f. Physiol.*, xxi, 146) performs a series of experiments on human subjects which verify the observations

of Johansson on animals. It is claimed that the increase in pulse rate during muscular activity is accomplished through the cardiac center, motor impulses being sent to the heart by way of the cardiac nerves. Increased respiration which accompanies muscular exercise is a sufficient explanation for the increase in the pulse rate. An increase of blood pressure does not affect the pulse rate. Although there is usually a parallelism between body temperature and pulse frequency, yet an increase in body temperature is to be looked on more as a result than an explanation of an increased pulse rate. The latter appears first. The products of metabolism after violent exercise were thrown into the circulation by massage. No change in the pulse rate was experienced. Massage and electrical stimulation of the skin also had no effect on the pulse rate. Peripheral centripetal nerves have no appreciable influence on the activity of the heart.

Stokes-Adams Disease and the Nerves of the Bundle of His.—J. Gordon Wilson, in a communication to the Royal Society, London, February 17 (reported in *Nature*, March 4, 1909), combats the myogenic theory of the Stokes-Adams syndrome. He mentions that both Tawara and Retzer had found nerve fibers and cells in the atrio-ventricular bundle, and gives the results of his own researches. The material used was obtained from the pig, calf and sheep, and the methylene blue "vital" method was followed. His conclusions were that the atrio-ventricular bundle, besides containing a special type of muscular fiber, differing from the ordinary heart muscle, contains an important and intricate nerve mechanism, in which are seen ganglion cells, monopolar and multipolar, the processes of which pass to adjacent cells and nerve fibers and to the muscle fibers and through the muscle bundle so far as it was examined; abundant nerve fibers running through it in strands; an intricate plexus of varicose fibers around the muscle fibers and an ample vascular supply with well-marked vascular nerves and sensory endings. These findings demonstrate that the interruption of an important nerve pathway must be reckoned with in the pathology of Stokes-Adams disease, and that this is at least as important a factor as the muscular involvement.

The Proportion of the Sexes.—At the session of the Royal Society, London (reported in *Nature*, March 11), Mr. Walter Heape presented a paper based on the statistics of births issued by the chief sanitary officer of Cuba, 1904-1906, covering 177,704 births, namely whites 135,881, and colored 41,823, including still births. These statistics show the following points: 1. There is a racial difference in the proportion of the sexes born; for whites, 108.44 males; for colored 101.12 males, for every 100 females. This agrees with other statistics for both races. 2. In both living births and still-births in both races there is a consistent variation in the proportion of the sexes produced by legitimate as compared with illegitimate union, for whites, legitimate 109, illegitimate 105.95 males per 100 females; for colored, legitimate 107.73, illegitimate 97.91 males per 100 females. There is therefore a marked increase in the proportion of females born in illegitimate births and it is asserted that they are chiefly induced by individual physiologic conditions affecting the metabolic activity of the woman. 3. In both whites and colored there are two sharply defined breeding seasons each year correlated with marked climatic changes tending to increase individual metabolic activity. At these times of greatest fertility the largest proportion of females are born. 4. A considerably higher proportion of females are born in towns than in country districts, where life is harder. 5. Although heredity in the main governs the proportions of the sexes born in the two races, there are sometimes variations under certain conditions, and these are similar in character for both races. These conditions are directly associated with forces which affect the metabolic activity of the mother, and suggest the probability that the ripening and production of ova of the different sexes is influenced thereby. Thus it is held that a struggle for existence is always going on among the sexual ovarian ova, and that these extraneous forces influence the result. Speaking generally it appears that the greater the metabolic activity of the ovary the more females are produced.

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS will not be noticed. Queries for this column must be accompanied by the writer's name and address, but the request of the writer not to publish name or address will be faithfully observed.

CHEWING GUM IN THE MALE BLADDER

To the Editor.—A young man, aged 28, well-developed, was referred to me from Portsmouth, Ohio, June 5, 1909. His physician was Dr. Merchant of Columbus, Ohio. The patient was a masturbator and used chewing gum in the form of a bougie; one day he lost control of the gum, which worked into the bladder. Examination showed a decidedly contracted meatus. Performed meatotomy not only to allow introduction of cystoscope, but in the hope that the contracted meatus was the cause of irritation inducing masturbation. Through the cystoscope the gum was seen doubled on itself in the form of a horseshoe. In the absence of operating cystoscope perineal section was performed and the gum delivered without difficulty. Though the gum had been in the bladder for thirty-five days there was no incontinence.

STANLEY S. WILCOX, Columbus, Ohio.

HAT-PIN IN THE MALE URETHRA

To the Editor.—I wish to report another case of a hat-pin in the male urethra. I was consulted by W. E., aged 57, who had inserted a six-inch hat-pin in his urethra and it had escaped from his grasp and the point was imbedded in the urethra about one inch from the meatus. I moved it by grasping the hat-pin with a pair of common hemostat forceps, pushing it back till the point was disengaged, then lifting the point of the pin between the blades of the forceps it was removed with no further injury to the urethra.

M. P. MRSSENGER, M.D., Oakfield, N. Y.

The Public Service

Army Changes

Memorandum of changes of stations and duties of medical officers, U. S. Army, for the week ended June 12, 1909:

Bispham, William N., major, ordered from San Francisco to Fort Leavenworth, Kan., for duty at the U. S. Military Prison.

Lamble, John S., Jr., 1st lieutenant, granted leave of absence for 16 days.

Blanchard, Robert M., captain, ordered to duty with troops from Fort Sheridan, Ill., at Toledo, O., military tournament, July 5 to 10.

Pipes, Henry F., captain, granted leave of absence for 1 month.

LaGarde, Louis A., lieutenant-colonel, when relieved at Denver, will proceed to Washington, D. C., for temporary duty at the Army Medical School.

Russell, Frederick F., major, granted leave of absence for 1 month, 15 days.

Christie, Arthur C., 1st lieutenant, granted leave of absence for 1 month, on arrival in the United States.

Gilchrist, Harry L., major, granted leave of absence for 1 month, about June 20.

Freeman, Paul L., captain, ordered from Fort Riley, Kan., to Fort Leavenworth, Kan., for temporary duty, about July 1.

Howell, Park, captain, relieved from duty at the Army General Hospital, Fort Bayard, N. M., and ordered to Fort Huachuca, Ariz., for duty.

Hoff, John Van R., colonel, granted leave of absence for 7 days.

Baker, Frank C., major, when relieved from duty at Fort Oglethorpe, Ga., will proceed to Fort Moultrie, S. C., for duty.

Haitcock, Frederick M., major, relieved from further duty at Fort Meade, S. D., will proceed at the expiration of his present leave of absence to Fort Wayne, Mich., for duty.

Conzelmann, Fred J., 1st lieutenant, M. R. C., relieved from duty at Fort Williams, Me., will proceed to Fort Caswell, N. C., for duty.

McPheters, Samuel B., 1st lieutenant, M. R. C., honorably discharged from the service of the United States, his services being no longer required.

Suggs, Frank, 1st lieutenant, M. R. C., ordered from Fort Niagara, N. Y., to Fort Strong, Mass., for temporary duty.

Keir, Robert W., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

Hayne, James A., 1st lieutenant, M. R. C., ordered to active duty. Will proceed to Fort Assiniboine, Mont., for duty.

Brown, Polk D., 1st lieutenant, M. R. C., ordered to Fort Clark, Texas, to march with troops to Fort Sam Houston, Texas.

Dunbar, Lee R., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

Frank, Clarence D., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

Goldthwaite, Ralph H., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

Hill, Eben C., 1st lieutenant, M. R. C., granted leave of absence for 6 days.

Leary, Thomas J., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

Mueller, Armin, 1st lieutenant, M. R. C., granted leave of absence for 14 days.

Shields, William S., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

Heath, George D., Jr., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

McDiarmid, Norman L., 1st lieutenant, M. R. C., granted leave of absence for 10 days.

Smith, William H., 1st lieutenant, M. R. C., granted leave of absence for 14 days.

Snow, Corydon G., 1st Lieut., M. R. C., granted leave of absence for five days.

Waring, John B. II., 1st Lieut., M. R. C., granted leave of absence for 7 days.

Bastion, Joseph E., 1st Lieut., M. R. C., ordered to duty with troops marching from Fort D. A. Russell, Wyo., to Fort Robinson, Neb.

Garcia, Leon C., 1st Lieut., M. R. C., granted leave of absence for 15 days.

Stayer, Morrison C., 1st Lieut., M. R. C., granted leave of absence for 10 days.

Slater, Ernest F., 1st Lieut., M. R. C., relieved from duty at Madison Barracks, N. Y.; will proceed to Fort Adams, R. I., for duty.

Davis, Addison D., 1st Lieut., M. R. C., granted leave of absence for 8 days.

Bierbower, Henry C., 1st Lieut., M. R. C., granted leave of absence for 2 months, when relieved from duty in the Philippines Division.

Hasseltine, Hermon E., 1st Lieut., M. R. C., granted leave of absence for 14 days.

Mount, James R., 1st Lieut., M. R. C., granted an extension of 10 days to his leave of absence.

Baker, Charles L., 1st Lieut., M. R. C., relieved from duty at Fort Huachuca, Ariz.; will proceed to the Presidio of San Francisco, Cal., for duty.

Poster, George B., Jr., 1st Lieut., M. R. C., ordered from Fort Totten, N. Y., to Fort Strong, Mass., for temporary duty.

Griswold, W. Church, 1st Lieut., M. R. C., relieved from duty at Fort Du Pont, Del.; will proceed to Fort Oglethorpe, Ga., for duty.

Murray, Wilson, 1st Lieut., M. R. C., ordered from Fort William Henry Harrison, Mont., to Fort Yellowstone, Wyo., for temporary duty.

Kearny, Richard A., 1st Lieut., M. R. C., honorably discharged from the service of the United States, his services being no longer required.

Holmes, Thomas G., 1st Lieut., M. R. C., relieved from duty in the Philippines Division; will proceed to San Francisco, and thence to his home, Detroit, Mich., for orders.

Navy Changes

Changes in the Medical Corps, U. S. Navy, for the week ended June 12, 1909:

The following officers have been detached from the Naval Medical School, Washington, D. C., and ordered as follows:

Bell, W. H., surgeon, Bureau of Medicine and Surgery, Navy Department, Washington, D. C.

Kennedy, R. M., surgeon, home and granted leave for 1 month.

Orvis, R. T., surgeon, to duty at the Naval Hospital, Navy Yard, New York.

Ledbetter, R. E., surgeon, to the Naval Academy, Annapolis, Md.

Murphy, J. F., P. A. surgeon, home to wait orders.

Smith, C. G., P. A. surgeon, to duty at the Naval Hospital, Norfolk, Va.

Wheeler, I. H., P. A. surgeon, to the Hancock.

Rodman, S. S., P. A. surgeon, to examination for promotion and then to wait orders.

Strite, C. E., asst.-surgeon, to Naval Recruiting Station, Baltimore.

Robnett, A. H., Cohn, I. F., Reed, E. D., Eyttinge, E. O. J., Woods, E. L., Brooks, F. H., Munger, C. B., and Olson, G. M., asst.-surgeons, to examination for promotion and then to wait orders.

Poster, T. G., asst.-surgeon, to duty at the Naval Prison, Portsmouth, N. H.

Blackwood, N. J., surgeon, to the Navy Yard, Washington, D. C.

Brown, E. W., asst.-surgeon, to the Vermont.

Riddick, W. J., acting asst.-surgeon, to the Navy Yard, Charleston, S. C.

Trotter, C. E., acting asst.-surgeon, ordered to duty at the Naval Hospital, Portsmouth, N. H.

Jenkins, H. E., acting asst.-surgeon, ordered to duty at the Naval Hospital, Norfolk, Va.

Cecil, A. B., acting asst.-surgeon, ordered to duty at the Naval Hospital, New York.

Bass, J. A., acting asst.-surgeon, ordered to duty at the Naval Hospital, Naval Home, Philadelphia.

Walton, D. C., ordered to duty at the Naval Hospital, Norfolk, Va.

DeValin, C. M., surgeon, detached from the Navy Yard, Washington, D. C., and ordered to the Marine Recruiting Station, Philadelphia.

Whitmore, G. B., asst.-surgeon, detached from the Naval Recruiting Station, Baltimore, and ordered to the Wisconsin.

Traynor, J. P., P. A. surgeon, detached from the Georgia and ordered to the Navy Yard, Boston.

Moran, C. L., asst.-surgeon, detached from the Navy Yard, Boston, and ordered to the Georgia.

Cuthbertson, R., asst.-surgeon detached from duty at the Naval Hospital, Mare Island, Cal., and ordered to the West Virginia.

Raison, T. W., asst.-surgeon, detached from duty on board the West Virginia and ordered to the Naval Hospital, Mare Island, Cal.

Smith, F. W., asst.-surgeon, detached from the Wisconsin and resignation accepted, to take effect June 15, 1909.

Peck, A. E., P. A. surgeon, detached from the Naval Medical School, Washington, D. C., and ordered to examination for promotion and then to wait orders.

Smith, C. G., P. A. surgeon, orders of June 4, to duty at the Naval Hospital, Norfolk, Va., revoked; detached from the Naval Medical School, Washington, D. C., and ordered to examination for promotion and then to wait orders.

Public Health and Marine-Hospital Service

List of changes of stations and duties of commissioned and other officers of the Public Health and Marine-Hospital Service for the seven days ended June 9, 1909:

Baillache, P. H., surgeon, granted 7 days' leave of absence from June 8, 1909, under paragraph 210, Service Regulations.

Gwyn, M. K., P. A. surgeon, granted 10 days' leave of absence from June 11, 1909.

Long, J. D., P. A. surgeon, granted 14 days' leave of absence from June 1, 1909.

Trask, J. W., P. A. surgeon, granted 2 days' leave of absence from June 8, 1909.

Spratt, R. D., P. A. surgeon, granted 20 days' leave of absence from June 2, 1909.

Brady, J. E., acting asst.-surgeon, granted 3 days' leave of absence from June 17, 1909.

Browne, R. W., acting asst.-surgeon, granted 5 days' leave of absence from June 7, 1909, under paragraph 210, Service Regulations.

Gregory, George A., acting asst.-surgeon, leave granted May 3, 1909, for 7 days from May 4, 1909, amended to read 5 days from May 4, 1909.

Hughes, Charles W., acting asst.-surgeon, granted 15 days' leave of absence from June 5, 1909.

Onuf, B., acting asst.-surgeon, granted 4 days' leave of absence from May 26, 1909, under paragraph 210, Service Regulations.

Rodman, J. C., acting asst.-surgeon, granted 7 days' leave of absence from June 8, 1909.

Schwartz, Louis, acting asst.-surgeon, granted 2 days' leave of absence from May 18, 1909, under paragraph 210, Service Regulations.

Simonson, G. T., acting asst.-surgeon, granted 2 days' leave of absence from June 8, 1909.

Slamberg, N. L. A. K., acting asst.-surgeon, granted 30 days' leave of absence from May 27, 1909.

Thornton, M. J., acting asst.-surgeon, granted 6 days' leave of absence from May 18, 1909, under paragraph 210, Service Regulations.

Walker, T. Dyson, acting asst.-surgeon, granted 14 days' leave of absence from June 2, 1909.

Gibson, R. H., pharmacist, granted 11 days' leave of absence from June 8, 1909.

Scott, E. B., pharmacist, granted 6 days' leave of absence from June 14, 1909.

Troxler, R. F., pharmacist, granted 1 day's leave of absence in May, 1909, under paragraph 210, Service Regulations.

Van Ness, George I., Jr., pharmacist, granted 30 days' leave of absence from June 10, 1909, without pay.

Megaw, H., pharmacist, granted 1 day's leave of absence, June 1, 1909, under paragraph 191, Service Regulations.

Stump, F. A., pharmacist, leave granted May 11, 1909, for 30 days from May 15, 1909, amended to read 30 days from May 27, 1909.

BOARD CONVENED

Board of medical officers convened to meet at the Bureau June 14, 1909, for the examination of candidates for admission to the service. Detail for the board: Surgeon L. L. Williams, chairman; P. A. Surgeon John McMullen; P. A. Surgeon A. M. Stimson, recorder. June 5, 1909.

APPOINTMENT

Dr. Edward G. Whipple appointed an acting asst.-surgeon for duty at Malone, N. Y. June 8, 1909.

RESIGNATION

Pharmacist R. H. Gibson resigned, to take effect June 18, 1909.

Health Reports

The following cases of smallpox, cholera and plague have been reported to the Surgeon-General, Public Health and Marine-Hospital Service, during the week ended June 11, 1909:

SMALLPOX—UNITED STATES

Alabama: Birmingham, May 15-22, 1 case.

California: San Francisco, May 15-22, 4 cases.

District of Columbia: Washington, May 22-29, 1 case.

Georgia: Macon, May 16-30, 13 cases.

Illinois: Chicago, May 22-29, 2 cases, 1 death; Danville, May 23-30, 5 cases; Springfield, May 21-28, 1 case.

Indiana: Indianapolis, May 23-30, 1 case; South Bend, May 15-29, 7 cases.

Iowa: Cedar Rapids, May 1-31, 3 cases; Davenport, May 23-30, 2 cases.

Kansas: Kansas City, May 15-29, 7 cases; Wichita, 11 cases.

Kentucky: Lexington, May 15-29, 3 cases.

Louisiana: New Orleans, May 15-29, 14 cases.

Maine: Van Buren, May 15-22, 3 cases.

Massachusetts: Northfield, April 1-24, 2 cases.

Michigan: Grand Rapids, May 15-29, 8 cases; Saginaw, May 8-22, 6 cases.

Minnesota: Duluth, May 20-27, 2 cases.

Missouri: Kansas City, May 22-29, 2 cases; Neosho, March 15, 6 cases; St. Louis, May 22-27, 1 case.

Montana: Butte, May 20-27, 1 case.

Ohio: Ashtabula, May 22-29, 1 case, 1 death; Cincinnati, May 14-27, 11 cases; Columbus, May 22-29, 1 case.

Tennessee: Nashville, May 22-29, 3 cases.

Texas: Fort Worth, May 1-26, 20 cases, 1 death; Galveston, May 21-28, 1 case; San Antonio, May 8-29, 13 cases, 1 death.

Utah: State of, April 1-30, 81 cases.

Washington: Spokane, May 8-22, 15 cases.

West Virginia: Wheeling, May 22-29, 1 case.

SMALLPOX—INSULAR

Philippine Islands: Manila, April 17-24, 13 cases.

SMALLPOX—FOREIGN

Brazil: Bahia, April 16-30, 5 cases, 1 death.

Canada: Halifax, May 15-22, 4 cases.

China: Amoy, April 17-24, present; Canton, March 27-April 17, 20 cases; Tientsin, April 17-May 1, 8 cases.

Egypt: Cairo, April 29-May 6, 4 cases, 9 deaths.

Great Britain: Bristol, May 8-15, 2 cases; Cardiff, April 24-May 1, 1 death.

India: Bombay, April 27-May 4, 17 deaths; Calcutta, April 19-24, 131 deaths; Madras, April 24-31, 5 deaths; Rangoon, April 17-24, 2 deaths.

Japan: Formosa, April 24-May 1, 1 case.

Java: Batavia, April 17-24, 4 cases, 1 death.

Mexico: Chihuahua, May 9-23, 2 cases; Mexico City, March 27-April 17, 93 deaths; Monterey, May 16-23, 3 deaths.

Russia: Moscow, April 24-May 8, 46 cases, 29 deaths; Odessa, May 1-8, 1 case; Riga, May 8-15, 2 cases; St. Petersburg, April 17-24, 22 cases, 7 deaths.
Siam: Bangkok, April 1-30, 6 cases, 2 deaths.
Spain: Almeria, April 1-30, 6 deaths; Barcelona, May 10-17, 6 deaths; Valencia, May 1-8, 8 cases, 1 death.
Uruguay: Montevideo, March 1-31, 8 deaths.

CHOLERA—INSULAR

Philippine Islands: Provinces, April 17-24, 17 cases, 30 deaths.

CHOLERA—FOREIGN

India: Bombay, April 27-May 4, 18 deaths; Calcutta, April 17-24, 98 deaths.
Siam: Bangkok, April 1-30, 1 case, 1 death.
Straits Settlements: Singapore, April 8-24, 5 deaths.

PLAGUE

Azores: Fayal, March 1-31, present; Terceira, April 1-30, 2 cases, 1 death.
China: Amoy, April 17-24, present; Canton, April 3-17, 20 cases, 13 deaths; Chang Poo, April 26, epidemic.
India: April 17-24, 4,681 cases, 4,007 deaths; Bombay, April 27-May 4, 430 deaths; Calcutta, April 17-24, 117 deaths; Rangoon, 24 deaths.
Japan: Formosa, April 10-May 1, 209 cases, 173 deaths; Osaka, April 25-May 1, 1 case, 1 death; Yokohama, May 15-18, 8 cases, 2 deaths.
Persia: Bahrein, May 12, 3 cases, 2 deaths.
Siam: Bangkok, April 1-30, 3 cases, 1 death.
Straits Settlements: Singapore, May 18-24, 1 death.
Trinidad: May 27, 1 death.
Venezuela: Caracas, May 20-June 3, 6 cases, 3 deaths.

Medical Education and State Boards of Registration

COMING EXAMINATIONS

ARIZONA: Phoenix, July 5-6. Sec., Dr. Anell Martin.
ARKANSAS: Homeopathic, Little Rock, July 13. Sec., Dr. P. C. Williams, Texarkana.
ARKANSAS: Regular, Little Rock, July 13. Sec., Dr. F. T. Murphy, Brinkley.
COLORADO: Denver, July 6. Sec., Dr. S. D. VanMeter, 1723 Tremont Place.
CONNECTICUT: Regular, New Haven, July 13-14. Sec., Dr. Charles A. Tuttle, 196 York St.; Homeopathic, New Haven, July 13. Sec., Dr. Edwin C. M. Hall, 82 Grand Ave.; Eclectic, New Haven, July 13. Sec., Dr. T. S. Hodge, 17 Main St., Torrington.
DISTRICT OF COLUMBIA: Washington, July 13-16. Sec., Dr. George C. Ober, 210 B St., S. E.
INDIANA: 120 State House, Indianapolis, July 13-15. Sec., Dr. W. T. Gott.
IOWA: Des Moines, June 1-3 and June 22-24; Iowa City, June 8-10. Sec., Dr. Louis A. Thomas, Des Moines.
KENTUCKY: Louisville, July 6. Sec., Dr. J. N. McCormack, Bowling Green.
MAINE: State House, Augusta, July 13-14. Sec., Dr. Frank W. Searle, 806 Congress St., Portland.
MASSACHUSETTS: State House, Boston, July 13-15. Sec., Dr. Edwin B. Harvey, Room 159, State House.
NEW HAMPSHIRE: Concord, June 29-30. Regent, Mr. H. C. Morrison.
NEW MEXICO: Santa Fe, July 12. Sec., Dr. J. A. Massie.
NEW YORK: Albany, June 22-25. Chief of Examinations Division, Dr. Charles F. Wheelock, Albany.
NORTH DAKOTA: Grand Forks, July 6-8. Sec., Dr. H. M. Wheeler.
OKLAHOMA: Guthrie, July 13. Sec., Dr. Frank P. Davis, Enid.
OREGON: Portland, July 6. Sec., Dr. R. C. Coffey.
PENNSYLVANIA: Philadelphia and Pittsburg, June 22-25. Sec., Mr. Nathan C. Schaeffer, Harrisburg.
RHODE ISLAND: Room 313, State House, Providence, July 1-2. Sec., Dr. Gardner T. Swarts, 315 State House.
SOUTH DAKOTA: Watertown, July 14-15. Sec., Dr. H. E. McNutt, Aberdeen.
TEXAS: Cleburne, June 22-24. Sec., Dr. M. E. Daniel, Honey Grove.
UTAH: Salt Lake City, July 5. Sec., Dr. G. F. Harding, 310 Templeton Bldg.
VERMONT: Burlington, July 13-15. Sec., Dr. W. Scott Nay, Underhill.
VIRGINIA: Richmond, June 22-25. Sec., Dr. R. S. Martin, Stuart.
WASHINGTON: Seattle, July 6-8. Sec., Dr. Kenneth B. Turner, Walker Bldg.
WEST VIRGINIA: Charleston, July 13-15. Sec., Dr. H. A. Barbee, Point Pleasant.
WISCONSIN: Madison, July 13-15. Sec., Dr. J. V. Stevens, Jefferson.
WYOMING: Laramie, June 23-25. Sec., Dr. S. B. Miller.

Higher Entrance Requirements Adopted

We are informed that the faculty of University Medical College, Kansas City, voted that, beginning with the college session of 1910-11, in addition to a four-year high school education, a year's college work be required to include courses in physics, chemistry, biology and foreign language. Only about ten of the better class of medical colleges remain which have not adopted this advanced standard.

Marriages

WILLIAM A. STEEL, M.D., to Miss Frieda Spierling, both of Philadelphia, June 4.
HENRY A. STECKER, M.D., to Miss Nellie M. Carrol, both of Philadelphia, June 2.
HENRY C. DOOLING, M.D., to Miss Nellie S. Essler, both of Clayton, N. J., June 3.
BURTON G. MCGARRY, M.D., Fenton, Mich., to Miss Hazel J. Brown, of Howell, Mich., June 3.
EARLE G. SHAFFER, M.D., Ely, Nev., to Miss Tina Hartnagle, of Denver, at Golden, Colo., May 29.
EDWARD MELLUS, M.D., West Newton, Mass., to Miss Marion Heath, of Augusta, Maine, June 1.
SPENCER P. BASS, M.D., Tarboro, N. C., to Miss Ethel Denver Pike, at Leesburg, Va., May 26.
ARTHUR HUBERT LONGSTREET, M.D., to Mrs. Miriam Annette Kent, both of Brooklyn, N. Y., May 26.
ALBERT E. STRIPP, M.D., Laurel, Mont., to Miss Montana Mildy Tschudy of Billings, Mont., June 3.
JAMES EDWARD BENSON, M.D., Cockeysville, Md., to Miss Laura Taylor, at Hagerstown, Md., June 1.
ARTHUR G. VADEN, M.D., Matthews, Va., to Miss Mabel L. Anderton, in Middlesex county, Va., June 3.
HARRY M. ROBINSON, M.D., New York City, to Miss Verna Beatrice Wilson, at Violetville, Md., May 25.

Deaths

Richard E. Haughton, M.D. Western Reserve University, Cleveland, 1853; Jefferson Medical College, Philadelphia, 1861; since 1857 a member of the American Medical Association, and for many years a member of the Mississippi Valley Medical Association; in 1873, professor of descriptive and surgical anatomy in Indiana Medical College; in 1874, made professor of physiology in the College of Physicians and Surgeons, Indianapolis, holding this chair for four years; in 1879, one of the founders of, and for fifteen years a professor in the Central College of Physicians and Surgeons, Indianapolis; one of the oldest and best known practitioners of Indiana; died at his home in Richmond, June 4, from chronic bronchitis, aged 81. Wayne County Medical Society, at a special meeting, held June 4, took action on the death of Dr. Haughton, and the society as a body attended the funeral two days later.

Valery O. Schayot, M.D. Tulane University, New Orleans, 1891; of Pointe a la Hache; a member of the Louisiana State Medical Society; from 1897 to 1900, coroner of Plaquemines parish; and from that time on parish health officer, president of the parish board of health, and secretary of the parish medical society; died in the New Orleans Sanitarium, May 29, from pneumonia, aged 39.

Joseph Leo De Varona, M.D. Cornell University Medical College, New York City, 1905; physician to the genitourinary department of Williamsburg Hospital; assistant visiting cystoscopist to St. Katherine's Hospital, and a member of the staff of St. Vincent's Hospital, Brooklyn; died at the home of his sister in Newark, N. J., May 29, aged 28.

Pliny Rand Watts, M.D. New York Homeopathic Medical College, New York City, 1887; once president of the California State Homeopathic Medical Society; president of, and surgeon to, the Sutter Heights Hospital, Sacramento, Cal.; died in the hospital, June 1, four days after an operation for appendicitis, aged 45.

William Riley Blakeslee, M.D. University of Pennsylvania, Philadelphia, 1853; surgeon of the One Hundred and Fifteenth Pennsylvania Volunteer Infantry during the Civil War; and local surgeon for the Pennsylvania Railroad; died at his home in Coatesville, Pa., June 3, from cerebral hemorrhage, aged 86.

Ernest A. von Boeckh, M.D. Atlanta College of Physicians and Surgeons, 1906; formerly in the hospital corps of the Army with service in the Philippine Islands; for two years an interne in Grady Hospital, Atlanta; died at his home in that city, from pleurisy, June 2, aged 31.

Joseph F. Cole, M.D. Atlanta Medical College, 1875; a member of the American Medical Association; secretary of the Carroll County (Ga.) Medical Society, secretary of the board of health and sanitary inspector of Carrollton; died suddenly at his home, June 1, aged 57.

John J. Schubert, M.D. Rush Medical College, Chicago, 1888; of Kankakee, Ill.; a member of the Illinois State Medical Society; in 1880, a member of the executive committee of the Illinois Pharmaceutical Association; died in the Presbyterian Hospital, Chicago, June 2, from cirrhosis of the liver, aged 49.

William Judson Riggs, M.D. Jefferson Medical College, Philadelphia, 1872; of Pittsburg; assistant surgeon, U. S. Navy, 1873 to 1876; a member of the Medical Society of the State of Pennsylvania; died at the home of his daughter in Cambridge Springs, Pa., May 31, from heart disease, aged 59.

Ryland D. Pratt, M.D. University of Louisville (Ky.), 1882; of Shelbyville, Ky.; a member of the American Medical Association; referee for Shelby county; and local surgeon for the Chesapeake and Ohio Railway; died in Mercy Hospital, Chicago, June 1, after a surgical operation, aged 49.

John M. Huffman, M.D. Jefferson Medical College, Philadelphia, 1870; a veteran of the Civil War; for many years a practitioner of Savannah, Mo., and later a resident of St. Joseph; died suddenly in Long Beach, Cal., May 25, from heart disease, aged 66.

Charles Ludwig Koch, M.D. Rush Medical College, Chicago, 1877; Chicago Homeopathic Medical College, 1878; of Quincy, Ill.; died suddenly, May 29, at a sanitarium in St. Louis, while being prepared for an operation, aged 50.

James Barney Welsh, M.D. Medical College of Ohio, Cincinnati, 1858; for many years U. S. pension examining surgeon for Preble county, Ohio, and a member of the board of education; died at his home in Eaton, May 29, aged 88.

Cornelius Robert Reagan, M.D. New York University, New York City, 1893; local surgeon for the New York Central Railroad; died suddenly at his home in North Tonawanda, N. Y., June 1, from angina pectoris, aged 45.

Elizabeth E. Francis, M.D. Homeopathic Medical College of St. Louis, Mo., 1898; of St. Louis; died May 31, from the effect of carbolic acid, said to have been self-administered with suicidal intent, aged 48.

Richard Mott Durbin, M.D. Cleveland College of Physicians and Surgeons, 1883; of Woodville, Ohio, and once mayor of that city; died near Hessville, Ohio, May 30, from cancer of the esophagus, aged 52.

Harry Annis Hill, M.D. University of Pennsylvania, Philadelphia, 1901; of Bethlehem, Pa.; died in St. Luke's Hospital in that city, April 23, from a self-inflicted gunshot wound of the head, aged 30.

James Gardner Laing, M.D. Berkshire Medical College, Pittsfield, Mass., 1854; Albany (N. Y.) Medical College, 1855; died at his home in Dallas, Pa., April 24, from chronic nephritis, aged 78.

Joseph Ulysses Roach, M.D. Tennessee Medical College, Knoxville, 1898; of Lafolette, Tenn.; died in the Lincoln Memorial Hospital, Knoxville, June 3, after a surgical operation, aged 32.

Silas M. Gleason, M.D. Hahnemann Medical College, Chicago, 1880; a member of the American Medical Association; died at his home in Ionia, Mich., May 31, from nephritis, aged 53.

W. E. Pearson, M.D. Medical College of the State of South Carolina, Charleston, 1859; of Scooba, Miss.; a Confederate veteran; died in Meriden, May 31, from cerebral hemorrhage, aged 73.

Elizabeth Marshall Knell, M.D. Homeopathic Medical College of Missouri, St. Louis, 1866; formerly of Baltimore; died at her home in Slatehill, Pa., June 4, from septicemia, aged 54.

George Albert Moulton, M.D. Rush Medical College, Chicago, 1885; a member of the Colorado State Medical Society; died at his home in Alma, May 7, from influenza, aged 49.

Armeritus B. Bixby, M.D. Castleton (Vt.) Medical College, 1858; a surgeon during the Civil War; died at his home in Poultney, Vt., May 3, from chronic pyelitis, aged 74.

Philip B. Tolford, M.D. Starling Medical College, Columbia, 1898; of Pittsford, Mich.; died in Sylvania, Ohio, May 28, after an operation for appendiceal abscess, aged 35.

Edward Franklin Gage, M.D. Harvard Medical School, Boston, 1893; a member of the Massachusetts Medical Society; died at his home in Winthrop, May 31, aged 46.

Alexander Fairley, M.D. Tulane University, New Orleans, 1876; a member of the Mississippi State Medical Association; died at his home in Mount Olive, May 29.

Richard Henry Hudson, one of the oldest residents of Sierre Madre, Cal., died at his home Nov. 16, 1908, from disease of the stomach and heart, aged 68.

Frank McClintock Macklin, M.D. Columbus (Ohio) Medical College, 1890; died at his home in Tarlton, Ohio, May 31, after an operation for appendicitis, aged 43.

Harriette Daggett Beebe, M.D. Pulte Medical College, Cincinnati, 1883; died at her home in Minneapolis, Minn., Nov. 19, 1908, from nephritis, aged 68.

Orin C. McCracken, a pioneer practitioner of California; died at his home in Oakland, April 2, from senile debility and chronic nephritis, aged 95.

John M. Kitchen, M.D. Willamette University, Salem, Ore., 1877; a Confederate veteran; died at his home in Stayton, Ore., March 16, aged 66.

Moses Livingston Allen, M.D. Western Reserve University, Cleveland, 1888; died at his home in Cleveland, June 3, from influenza, aged 55.

George Inglis, M.D. Pennsylvania Medical College, Philadelphia; of Pittsburg; died in Denver, Colo., June 5, from pneumonia, aged 78.

John C. Outhet, M.D. Barnes Medical College, St. Louis, 1899; of Chicago; died in San Mateo, Cal., June 7, from pneumonia, aged 34.

William M. Cunningham, M.D. Tulane University, New Orleans, 1878; died at his home in Bastrop, Texas, May 24, aged 59.

George W. McMurray, M.D. University of Nashville, Tenn., 1858; died suddenly at his home in Hurricane, Tenn., May 21, aged 70.

William J. Bricker (license, Ill., 1878, years of practice); died at his home near Makanda, Ill., February 12, aged 67.

Eugene J. Setze, M.D. Medical College of Georgia, Augusta, 1852; died at his home in Marietta, Ga., May 30, aged 80.

Development of Milk Laboratories, Foodstuffs They Can Provide, and Principles of Infant Feeding

DR. THOMAS MORGAN ROTCH, Boston: There has been little real progress in infant feeding the last four or five years. We never have accomplished in so-called artificial feeding what has been done by Nature's process of feeding from the human breast, but there is no question that in many cases human breast milk is exceedingly bad for young infants. The baby is fed on routine mixtures as a rule, with less scientific knowledge, less real practical knowledge, and almost with ignorance, to a greater extent than occurs in any other branch of our profession. There is no rule for feeding babies. During the first year of life each individual differs from another. A large amount of the practical knowledge has come from the farmers, and the only way is to learn from all who can give it to us. The profession at large is very far behind what it ought to be. Cheap milk is a dangerous factor. There are eighteen model farms in this country and one in London in connection with the laboratories in large cities. On these farms absolute care is taken of the milk, the cow is kept as cleanly as possible, the pail is protected with a top over it, and the milkers are absolutely clean. I do not believe in milking machines; I think the human hand produces better milk than any machine. Cows should not be fed before milking as dust arises. All physicians should see that the

milk is brought in almost direct to the consumer. In one case a baby, the child of wealthy parents, was sent across the water. The mother refused to nurse it. It was fed first in Boston, then went to New York to take the steamer. It carried with it about 200 gallons of milk heated twice to 155 degrees, which went through the Straits of Gibraltar, to Southern France, and was still used after arriving there. If a baby does not digest fat well the digestion of the baby must be fitted to take it, and we make a combination of food fitted for that special baby. Not one man in a thousand can tell you why he gives barley water for diarrhea. It is simply a little peculiarity of the human race. If one combines the elements and knows how to use them he will make a tremendous stride in infant feeding. In Stockholm for a half century babies afflicted with diarrhea have been given butter-milk. America has now taken that matter up and is meeting with great success. In fact, all other countries are twenty years behind us in the matter of infant feeding. We have the best farms in the world, the best research laboratories for milk, and have young American men who come to the front and are not going to be kept down by tradition.

DISCUSSION

MR. C. D. HOWARD, Concord: The whole matter of artificial feeding is still in its infancy. "Patent" foods should be regarded as not only expensive but very poor substitutes. Until the milk-laboratory becomes a more generally established institution the average physician will be compelled to figure the thing out as best he can. In regard to the various brands of milk sugar found for sale in the stores, after making an examination of them I find that the better known brands, those selling at a somewhat higher price, are no better in regard to adulteration than the others. In fact, the brand that sells at the highest price—especially recommended by the packers as being an article of exceptional excellence—was found to be the poorest in the lot.

Milk and Disease

DR. H. W. N. BENNETT, Manchester: Milk is a constant factor in our health, a means of preventing disease, of nourishing patients through acute illness, and is especially important to infants and invalids. We buy milk in the belief that we are getting pure food, but too often receive a mixture of fecal contamination and virulent bacterial poisons, loaded with potential death. If milk were a transparent fluid it would show evidence of its condition to the naked eye. A similar amount of bacterial growth in broth, gelatin, beer, jelly, etc., would result in its condemnation even by the untrained eye. That the milk supply is responsible for a large proportion of the infantile death rate is shown by the decrease in the death rate when attention is paid to milk. In childhood, contagion in two important acute diseases, diphtheria and scarlet fever, is conveyed by milk. When thus conveyed they are epidemic. To the epidemic diseases must also be added typhoid fever. Trask has compiled 179 typhoid epidemics spread by milk, 107 of which occurred in the United States. In 96 of these epidemics all patients were reported as living in houses supplied with the infected milk.

DISCUSSION

DR. GEORGE C. WILKINS, Manchester: The remedy, or rather the prevention of the infection of milk by bacteria must come from a cleaner and more intelligent handling of the milk at the dairy. Two methods can be used for improving this condition: an efficient system of dairy inspection under the State Board of Health, not only into the methods of handling but into the health of the cows and employes; and the placing of added commercial value on clean milk.

DR. H. W. N. BENNETT, Manchester: I have found several farmers trying to sterilize the milking pails by pouring water brought from the kitchen, from one to another, and that water when it starts at the house would be 212° F., the first pail 165°, second 147°, third 127°, and the lowest point at which hot water will kill bacteria is 150° F.

ASSOCIATION OF AMERICAN PHYSICIANS

Twenty-fourth Annual Meeting, held at Washington, D. C., May 11-12, 1909

(Concluded from page 1979)

Changes in Metabolism Produced by Exclusion of Pancreatic Juice from Intestines

DRS. J. H. PRATT, P. D. LAMSON and H. K. MARKS, Boston: The head of the pancreas was separated from the duodenum, the ducts tied and a portion of the great omentum placed between the pancreas and duodenum. In a dog in which the ducts were tied, but no barrier of living tissue placed between the cut ends and intestinal wall, a small fistulous tract formed and pancreatic juice entered the intestines. Failure to exclude all the pancreatic secretion explains the results obtained by recent investigators who found no marked disturbance of metabolism after ligating the ducts. In all four dogs of the present series there was great interference with the absorption of nitrogen and fat. There was marked loss of weight. The stools were very large. The splitting of the fat was normal.

DISCUSSION

DR. W. G. MACCALLUM, Baltimore: Dr. Pratt tells me that there was some disturbance of carbohydrate metabolism in these cases. It is well known that ligation of the pancreatic duct or its obstruction finally leads to atrophy of the secreting portion of the pancreas, whereas the islands of Langerhans remain intact, and this is the basis of the dispute. Opie and others have assumed, and apparently proved, that the islands of Langerhans alone are responsible for the maintenance of proper carbohydrate metabolism, whereas others think that this is not yet proved, but that in all probability all the pancreatic tissue is necessary.

DR. J. H. PRATT: I have tested the tolerance for carbohydrates in two dogs that survived operation for two months or more. I found that, while a healthy dog would take 75 grams of glucose with a non-carbohydrate diet before any glycosuria developed, in my two dogs a marked glycosuria developed when 35 grams of glucose was given. I found no increase of tolerance as time passed. My observations show that in the first case that came to autopsy two months after the operation, the pancreas, which had formerly been 10 centimeters long, was nothing but a shriveled, firm bit of scar tissue about 3 centimeters long. Cross-sections showed some scattered areas of epithelial cells between wide bands of connective tissue, and not a trace of the islands of Langerhans could be found.

Exophthalmos in Chronic Nephritis

DR. L. F. BARKER, Baltimore: The occurrence of exophthalmos in nephritis is not mentioned in any text-books, and at Johns Hopkins Hospital recently we have done some special work to determine in what proportion of cases it occurs. Out of 33 cases of chronic nephritis in the wards that have been studied since January 1 of this year, 16 presented this condition. This is more than could be merely coincidences. The degree of exophthalmos varied apparently with the degree of uremic poisoning, though not in all cases. It was rather striking that retinitis is often associated with the exophthalmos. There was hypertension in 12 out of the 16 cases. It is our opinion that the intoxication leads to a tonic contraction of the muscle fibers passing from the septum orbitale to the eye, and that this causes the exophthalmos.

DISCUSSION

DR. WILLIAM OSLER, Oxford, England: These are all cases with high blood pressure, and the question is whether that may not have some association, because we know in the inequality of the pupils in aneurism it is largely a matter, not as we had supposed of the sympathetic irritation, but of the blood pressure.

DR. W. S. THAYER, Baltimore: I can heartily confirm all that Dr. Barker has said. I have often been helped as I entered the sick room by noticing the slight staring expression in the eyes of the patient, which would at once suggest chronic nephritis. I had always supposed it was due to high blood pressure. I do not feel that it is a sign of importance.

DR. JAMES TYSON, Philadelphia: I am sorry to say that in a considerable experience in cases of chronic nephritis it has never occurred to me to observe this condition. Now, as I look back over my experience I can recall cases, but I confess it never impressed me as being a part of the symptomatology of the disease. I can not help but think that sometimes this condition must be a coincidence. Especially in the colored race the eyes are rather protuberant independently of association with any condition.

DR. W. H. THOMPSON, New York: For a number of years I have directed the attention of students to the staring expression of the eyes as a very unfavorable sign in chronic nephritis. I ascribed it at that time to the immobility of the pupil, and in some of the cases undoubtedly it was so, for the pupil does not react to light.

Clinical Resemblances Between Pneumococcus and Meningococcus Infections

DR. ROBERT B. PREBLE, Chicago: Certain phenomena occur so constantly in pneumococcus infections that I have come to regard them as the specific effects of this particular organism. These effects are acute at onset, leucocytosis, herpetic eruption usually over one or two branches of the fifth or seventh nerves and a low excretion of chlorids. None is absolutely peculiar to this organism, but the combination is peculiar, there being no other organism except the meningococcus which produces this combination. There is no reference in the literature to a low chlorid excretion in meningitis, but in the cases which I have examined I have found the excretion of chlorids low. There is also a striking similarity between the seasonal distribution of the two infections. Certain complications which we have come to associate with pneumococcus infections, such as arthritis, pleuritis, pericarditis and endocarditis, also occur in meningococcus infections. In view of these resemblances between pneumococcus and meningococcus infections, it has occurred to me that the meningococcus may be the pneumococcus with its virulence lessened.

DISCUSSION

DR. WILLIAM OSLER, Oxford, England: Many of us have had brought before us the great similarity of these two diseases, and yet there are striking peculiarities and differences when we consider simply the meningitis. The pneumococcus infection is uniformly fatal. The pneumococcus meningitis is rarely, if ever, a spinal affair, whereas, as we all know, the meningococcus infection may be a spinal condition only or a cerebrospinal. Endocarditis, which is so common in pneumococcus infection, is rare in cerebrospinal fever. There is no question about the similarity in the seasonal conditions, but I think the two diseases are clinically rather sharply separated from each other—much more so than the organisms are bacteriologically.

DR. HENRY KOPLIK, New York: I think when we consider the entire subject the great similarity between the two infections is manifest, especially in the cerebral symptoms. The more I see of pneumonia with cerebral symptoms, the more I am impressed with the great difficulty at the outset of determining the presence or absence of a meningitis in a given case of pneumonia. We must also remember that in a pneumococcus infection of the lung, complicated with meningitis or peritonitis or endocarditis, these complications may be due to the streptococcus.

DR. L. F. BARKER, Baltimore: The term meningismus as contrasted with meningitis can not be too much emphasized, it seems to me. We all know how common it is in pneumonia, typhoid fever and similar infections to see retraction of the neck and other signs which make us suspect meningitis, and yet lumbar puncture in so many of these cases is negative. If they come to autopsy there is found no meningitis. Often these patients recover in a few days, usually without any definite signs of meningitis. I think that meningismus must be recognized as a definite clinical phenomenon, probably toxic in its origin, and not due to an actual infection of the meninges.

DR. J. J. KINYOUN, Washington, D. C.: Has Dr. Preble made any experiments with the autolysis of the pneumococcal cultures as compared with the meningococcus? Some experi-

ments made two or three years ago with these organisms showed that there was no autolytic toxin formed in the pneumococcus, whether the organism was of a virulent type or not, whereas it was an easy matter to obtain an autolytic toxin from the meningococcus.

DR. LEWIS A. CONNOR, New York: Has Dr. Preble any data bearing on the question of the chlorid excretion in other blood infections—septicemia—particularly streptococcus septicemia? In other words, is he convinced that a low chlorid excretion is a peculiarity of pneumococcus and meningococcus septicemia?

DR. R. PREBLE: I have made no studies on the autolysis. A low chlorid excretion is shared by all acute infections, but there is no other infection in which the excretion of chlorids reaches so low a point—so low sometimes that the urine seems to contain practically no chlorids at all—and that peculiarity of the urine is shared by the meningococcus infection, but not by any other that I know of. I am sorry that the discussion has been on the unimportant aspects of the matter, and not on the four points of resemblance in the clinical effects.

The Present Status of the Serum Treatment of Epidemic Cerebrospinal Meningitis

DR. SIMON FLEXNER, New York: In the more than two years which have elapsed since the serum was first issued more than 1,000 cases of epidemic meningitis, diagnosed bacteriologically, have been treated with it. The histories of over 800 such cases have been collected, but they have not all been subjected to analysis. The last careful analysis which I made covered about 550 cases. I have contended and still contend that the real test of the serum must come at some future time when an epidemic exists, when the serum can be applied at the beginning of the disease. When the serum was perfected, the epidemic which had been raging in this country had practically ceased. In the epidemic in Scotland and Ireland about a year after the American epidemic, the introduction and use of the serum either greatly modified the disease, or the disease was on the point of turning at the time, because the results were in contrast with those which had previously existed. The mortality had been about the same as in this country, namely, 75 per cent. The introduction of the serum in Edinburgh reduced the mortality to about 40 per cent., and in Belfast to less than 30 per cent. The reports received from France are not conclusive, but are very interesting. In Netter's latest report he said he had treated up to that time 10 children under 2 years of age, of which 1 had died, while all the others recovered. Calmette reports that of 14 soldiers taken ill within a few days at the barracks, 13 recovered and 1 died. There have been two localized outbreaks in this country, one at Jefferson Barracks, Mo., and another at McKinney, Texas. At Jefferson Barracks there were 6 cases. In the first soldier to have the disease it was not recognized, and he died without any specific treatment. Subsequently, there were 5 cases. The surgeon made the diagnosis by lumbar puncture in some of the cases even before the localizing symptoms appeared, gave the serum and the patients all recovered. At McKinney, Texas, there had been 5 cases in rapid succession, in all of which the patients had died. The doctors then procured some serum, and 5 subsequent patients who received the serum all recovered. It seems from the evidence at hand that the serum is effective, at least in many cases—not in all.

DISCUSSION

DR. A. C. ABBOTT, Philadelphia: Experience in Philadelphia bears out what Dr. Flexner has said with regard to the presence of an epidemic. The winter before last about 20 patients were treated with the serum, but there was not an epidemic in the city, and many of the patients came to the hospital late in the disease. Notwithstanding this, the results were better than with any other treatment tried. It is my practice to withdraw from the spinal canal the same amount of fluid I intend to inject, thus diminishing the subsequent escape of the serum from the canal.

DR. HENRY KOPLIK, New York: I feel that in this serum we at last have a weapon against this scourge. The results have

been especially gratifying in children under 2 years of age. Hitherto, from a clinical standpoint, physicians have felt that patients of this age were lost. If the child did recover from the meningitis, there was always left some cerebral defect. Up to the present time I have had in my service 6 babies ranging from 5 months to 2 years of age. Of these, 3 made complete recoveries.

DR. W. H. THOMPSON, New York: If this serum continues to give as favorable results as we have now good reason to hope, it is indeed a boon to humanity. Some years ago in Roosevelt Hospital 30 cases occurred in my ward, and of those the first 16 patients all died except 1, and of the remaining 14 all lived except 1. The treatment was the same with all. Therefore, in order to judge the efficacy of any treatment we should wait until not only a great many cases are treated, but the time in the epidemic should be correctly noted.

DR. LEWIS A. CONNOR, New York: The cases treated at the Hudson Street Hospital have been of the worst type, many of them ambulance cases. I do not think, therefore, that our experience was a fair test of the treatment.

DR. L. F. BARKER, Baltimore: At Johns Hopkins Hospital about the same number of cases of meningitis were treated with the serum in one year as had been admitted to the hospital in the previous eighteen or nineteen years of the institution's existence. During these years the mortality was about 80 per cent., and the recoveries about 20 per cent. During this one year when the serum was used the mortality was only about 20 per cent., recoveries about 80 per cent. The figures were just reversed. To us it was a very striking experience, and we feel much encouraged.

DR. JAMES EWING, New York: There are two problems here: Does the injection of a quantity of serum into the spinal canal reduce the mortality, and, if so, how? The first is clinical, the second belongs to the laboratory. The reports show satisfactorily that it does reduce mortality. I feel, however, that the mechanism or action of the serum is still entirely undecided. I think laboratory men as a rule are inclined to believe that the reduction in the mortality of meningitis from the use of this serum may be due to its normal bactericidal action. Dr. Flexner should accomplish something without an epidemic at reaching a conclusion if he would inoculate a certain number of subjects with normal horse serum in the same way that he does with the meningitis serum. If that could be done in 100 cases I think the laboratory men would be satisfied.

DR. S. FLEXNER: I do not believe it would be ethical to inject normal horse serum so long as we could get the other serum. Personally, I would not accept the responsibility of carrying out that experiment on human beings. Experiments have been carried out on monkeys, though not on a large scale, and in them there was apparently a considerable difference. The experimental work on animals was interrupted on the supposition that the final decision would come from the application of the serum in the treatment of the disease in man.

The Cammidge Reaction in Experimental Lesions of the Pancreas

DRS. JOHN SPEESE and EDWARD H. GOODMAN, Philadelphia: The Cammidge reaction is a constant feature in acute hemorrhagic pancreatitis, in mechanical injuries to the gland (crushing of the tail, partial extirpation) and in total extirpation. In certain cases of the subacute type of pancreatitis, the reaction is inconstant. The nature of the phenylhydrazin compound is not definitely established. If pentose, it is not that derived from the pentose-yielding material of the pancreas. A positive reaction is indicative of altered carbohydrate metabolism due to disturbance of the internal secretion of the pancreas.

A Case of Scarletina and Diphtheria Successfully Treated Without Medicine

DR. W. H. THOMPSON, New York: The patient was a girl aged 5 who was first attacked with scarlatina and on the seventh day developed diphtheria. When I saw her first, in consultation, the membrane had extended over the pharynx,

uvula, and into the nose, and had a very fetid odor. She was wholly unable to swallow. The further complications were abscesses in both ears, pneumonia and pleurisy on left side and persistent heart weakness with very intermittent pulse. She wholly recovered after thorough douching of the throat with two gallons of hot water every two hours. This result I regard as in keeping with my recommendation to douche the throat in every case of scarlatina from the first onset of symptoms, so as to prevent invasion by streptococci, which, in my opinion, are the main cause of the complications of both scarlatina and diphtheria.

Influence of Ductless Glands on Pancreas

DRS. RALPH PEMBERTON and J. EDWIN SWEET, Philadelphia: The inhibition of pancreatic secretion by adrenalin is, in part at least, independent of systemic blood pressure, as shown by its persistence when the blood pressure is much below normal and by other evidence. The inhibition by extracts of pituitary and suprarenal bodies also occurs when the pancreas is stimulated by its normal excitant, hydrochloric acid in the duodenum. In dogs rendered diabetic by extirpation of the pancreas the mucosa of the duodenum remains abundant, in striking contrast to the emaciation of other tissues; and acid extracts of the mucosa are as active as, if not more so than, those from normal animals. Studies of the inhibition of pancreatic flow by adrenalin in thyroidectomized and parathyroidectomized dogs have indicated no clear departure from the normal in this regard. The evidence now at hand indicates that the suprarenal glands exercise at all times an inhibitory power on the pancreas and that on the removal of this influence by ablation, the pancreas secretes more rapidly. The agonal period of life is accompanied by an exacerbation of the normal rate of pancreatic flow.

Clinical and Experimental Observations on Adrenalin

DR. J. T. HALSEY, New Orleans: Oral administration of ordinary amounts of adrenalin does not cause changes in blood pressure or heart action. Subcutaneously administered in doses of from 1/100 to 1/40 gr. adrenalin is uncertain in its effects on the blood pressure, but usually causes a slight rise and may cause a marked rise with distinctly more forcible heart action. Given intramuscularly in this dosage it usually causes a rise in blood pressure which may be so great as to cause alarming symptoms and perhaps serious results. The initial dose in any case should be a small one, for individuals vary markedly in the degree to which they react to suprarenal active principle when administered hypodermically.

The Importance of Blood Culture in the Study of Infections of Otic Origin

DRS. E. LIBMAN and H. L. CELLER, New York: The investigations of the blood for bacteria are of great importance to the otologist and to the clinician in the study of borderline cases. Positive findings often give the indication for important therapeutic procedures. Incidentally, the studies give the opportunity for investigation of the rapidity with which the body can get rid of a bacteremia.

Wassermann Reaction in Cardiac and Vascular Disease

DRS. JOSEPH COLLINS and B. SACHS, New York: We have collected a large number of cases of cardiac and vascular disease in order to test the value of the Wassermann reaction, with reference to the claim that the test is positive in many of these, and above all in aortic insufficiency. The results of these various tests tend to prove the great importance of syphilis as an etiologic factor in disease of the heart and blood vessels.

ARKANSAS MEDICAL SOCIETY

Thirty-third Annual Meeting, held at Pine Bluff, May 13-21, 1909

The officers elected and resolutions adopted regarding public health were given in *THE JOURNAL*, June 5, 1909, page 1843.

Symposium on Tuberculosis

A symposium on tuberculosis to which the public was invited was given under the auspices of the Arkansas Association for the Relief and Control of Tuberculosis; it was well attended and aroused great interest. The following were the papers read: "The Causation, Mode of Prevention, and Hygiene of Tuberculosis," by Dr. E. R. Dibrell, Little Rock; "The Economic Importance of Tuberculosis," by Dr. J. S. Shibley, Paris; "The Protection of Schools from Tuberculosis," by Prof. Junius Jordan, superintendent of schools, Pine Bluff; "Prophylaxis of Tuberculosis," by Dr. D. S. Warren, P. A. Surgeon, U. S. Public Health and Marine-Hospital Service.

President's Address: Education of Public Concerning Preventable Diseases

Dr. J. CLEGG, Siloam Springs, said that the profession should enlighten the public in regard to sanitation and hygiene. He deplored the annual inroads of tuberculosis, diphtheria, typhoid, malaria, and the vast amount of cost, poverty, crime and human misery incident thereto. While the task was herculean and the results possibly long delayed, still the great need was everywhere apparent, and the presence of the sorrow-faced women, the sickly babes and the yellow-skinned men, were a constant reminder both to the profession and the public of the value of prophylaxis and the great need of the education of the laity. He favored state aid to medical schools, hospitals and laboratories, and higher standards of medical education, literary attainments and mental capacity for those desiring to enter the profession. Industry and observation plus thought and learning made the ideal practitioner. He condemned in severest terms so-called medical journals conducted not for altruistic motives, conveying no information of new truths and discoveries in the advancement of medical science, but published in the interest of some worthless proprietary or quack remedy. Such journals were truly caviars in the fleece of lambs. It was absurd to require of medical men learning and literary qual-

fications, while faith-cure, scientist, and mental-suggestion dabblers were permitted to foist themselves on the public. He emphasized the great need of a state board of health with authority to compel action in matters of sanitation and hygiene. He recommended the distribution of antitoxins at convenient places in the hands of competent custodians, and that an effort be made to abolish the duty on surgical instruments and physicians' accessories, that exorbitant prices might be discountenanced. He counseled cooperative work in county societies; much had been done and much should be done to increase the efficiency and helpfulness of every county society.

Advances in Research Work in Syphilology

Dr. ELLIS, Hot Springs, referred to the rapid strides in research work, serodiagnosis of syphilis, and the new methods for demonstrating the presence of spirochetes. He favored the inhalation method of administering mercury, especially in cases of syphilitic sore throat. He believed syphilis should be deemed notifiable, and that affected individuals should be restricted during the infective period. He recommended regulations in regard to indiscriminate use of drinking fountains and other public utilities; referred to restrictions of railroads and life-insurance companies regarding syphilitics, which he said should stimulate the profession to renewed effort toward palliation and eradication. He also mentioned the increase in pellagra in the south and suggested inauguration of a rigid system of inspection of maize.

Prevention of Disease

Dr. H. H. NEHRSS, Wesson, dwelt on the duty of the practitioner to the laity in the prevention of disease. He believed in extended education along sanitary lines; favored the teaching of hygiene in the public and private schools; and stated his belief that the profession should share the blame for defective health regulations and lax indifference to duty in failing to enforce cleanliness everywhere.

Advances in Surgery

Dr. A. E. SWEATLAND, Little Rock, called attention to the tremendous advancement in surgery; emphasized the great value of prompt operative measures; condemned vigorously dilatory conservatism; referred to the great improvement in gall-bladder surgery, and treatment of uterine displacements; and condemned the shortening of round ligament in uterine and ovarian fixations.

Responsibility of the Surgeon in Gynecologic Conditions

Dr. C. S. PETTUS, El Dorado, condemned in severest terms the laxity in appreciation of responsibility on the part of the surgeon, and the wholesale extirpation of the female reproductive organs. He reminded the profession of the care and sympathy due the pregnant woman, and commended future womanhood to the care of the conscientious gynecologist.

Other Papers Read

The following papers were also contributed: "Duration of Treatment of Syphilis," Dr. E. C. Hay, Hot Springs; "Pneumococcus Endocarditis," Dr. C. H. Hoffman, Little Rock; "Clinical Observations in Mastoid Surgery (with Demonstrations)," Dr. Robert Caldwell, Little Rock; "The Education of the Laity," Dr. John S. Jenkins, Pine Bluff; "Race Suicide from the Physician's Viewpoint," Dr. E. E. Barlow, Dermott; "The Office Treatment of the More Common Diseases of the Rectum," Dr. C. P. Meriwether, Little Rock; "Polypharmacy and Therapeutics," Dr. L. P. Gibson, Little Rock; "Report of a Medicolegal Case," Dr. H. C. Dunavant, Osceola; "Tetanus, with Report of Cases," Dr. G. A. Warren, Black Rock; "Pernicious Malaria," Dr. F. O. Mahoney, Huttig; "Vital Statistics," Dr. D. S. Warren, P. A. Surgeon U. S. Public Health and Marine-Hospital Service, St. Louis; "Acute Dilatation of the Stomach and Duodenum," Dr. C. H. Carhile, Bentonville; "Amebiasis," Dr. J. T. Jelks, Memphis, Tenn.; "Venereal Prophylaxis," Dr. G. A. Hebert, Hot Springs; "Therapeutic Value of Some of the Electric Modalities," Dr. W. T. Lowe, Pine Bluff; "Physiologic Laws Governing the Action of Purga-

tives," Dr. G. E. Petty, Memphis, Tenn.: "Postoperative Reus," Dr. Anderson Watkins, Little Rock: "Appendicostomy in Treatment of Epilepsy," Dr. J. P. Runyan, Little Rock: "A Case of Neuroparalytic, or Trophic Ulcer, Treated Surgically," Dr. R. C. Dorr, Batesville: "An Interesting Case of Abdominal Surgery," Dr. G. S. Brown, Conway: "Emergency Surgery," Dr. J. A. Foltz, Fort Smith: "Ectopic Pregnancy," Dr. G. E. Cannon, Magnolia: "Extrauterine Pregnancy," Drs. W. V. Laws and W. Chestnut, Hot Springs: "Neuroses Due to Pelvic Lesions Treated Surgically," Dr. W. C. Dunaway, Little Rock: "Too Much Operative Gynecology," Dr. J. W. Meek, Camden: "The Relief of Suffering During Labor," Dr. G. W. Murphy, Strong: "Report of a Case of Uremia," Dr. J. A. Moore, Lishon.

MEDICAL ASSOCIATION OF GEORGIA

Fiftieth Annual Meeting, held at Macon, April 21-23, 1909

The President, DR. T. D. COLEMAN, in the Chair

A list of the officers elected was given in THE JOURNAL, May 8, 1909, page 1503.

History of Modern Treatment of Penetrating Wounds of the Abdomen

DR. THOMAS R. WRIGHT, Augusta, read an interesting paper giving a summary of the modern treatment of penetrating wounds of the abdomen, which was considered so valuable by the association that it was recommended that a copy be sent to every physician in the state.

Symposium on Pellagra

Papers on this subject were read by the following: Drs. N. P. Walker, Milledgeville, Lawrence Lee and Earnest S. Cross, Savannah, and H. F. Harris, Atlanta.

The Common House Fly the Principal Cause of Typhoid Fever

DR. J. W. PALMER, Ailey, read this paper, and Dr. J. G. Dean, Dawson, offered the following resolution, which was adopted:

Resolved: That there shall be appointed a "typhoid fly" committee, consisting of five executive members and one member from each county of the state, whose duty it shall be to educate the public by giving public lectures, especially to public schools, high schools and colleges, and through the press on the dangers of the common house fly, and other insects which are notorious for conveying typhoid fever and other diseases.

State Sanitarium for Tuberculosis

The Committee on Public Policy and Legislation reported that last June a bill introduced in the Georgia legislature, providing for the establishment of a state sanitarium for tuberculosis, was passed and an appropriation made for that purpose.

Contribution to Carroll Fund

On motion of Dr. Thomas J. McArthur, an appropriation of \$100 was voted toward the fund for raising the mortgage on the home of the late Major James Carroll.

Antirabic Serum

Two papers were read on this subject by Drs. J. N. Brawner, Atlanta, and J. E. Paullin, giving reports from the Georgia Pasteur Institute and the Georgia State Board of Health, showing that there is a marked increase of rabies in the state.

Following the reading of these papers, Dr. Claude A. Smith, Atlanta, said that as it has been demonstrated in Great Britain and other countries that rabies can be stamped out by the muzzling of dogs, the Committee on Public Policy and Legislation of the association should be asked to take up the matter of securing the enactment of the bill which was introduced before the legislature requiring the muzzling of dogs; and that, if in the judgment of the committee it be wise, the cooperation of the lay press be secured in disseminating knowledge regarding this disease, and in the enactment of the bill.

ILLINOIS STATE MEDICAL SOCIETY

Fifty-Ninth Annual Meeting, Held at Quincy, May 18-20, 1909

(Concluded from page 1973)

Recognition and Treatment of Extrauterine Pregnancy

DR. CHANNING W. BARRETT, Chicago: From a study of implantation and the progress of the ovum there are grounds for the conception that the ovum is a parasite living at the expense of its host. Previous pelvic disease, frequently of gonathical origin, seems to play an important part as an etiologic factor. A study of the pathology indicates in the case of extrauterine pregnancy, a parasitic growth which develops malignant tendencies due to the incapacity of the maternal tissues to cope with it. The extrauterine ovum is suicidal and matricidal in its tendencies. The risk to the mother is largely, though not entirely, that of hemorrhage.

The less frequent causes of death or morbidity are sepsis, obstruction of bowels, fistulas, etc. The prognosis for the ovum is so uniformly bad that it should receive no consideration except in cases of visible embryo. The menace of extrauterine pregnancy to life and health of the host is so great that an early diagnosis and prompt removal of the ovum is of prime importance. Extrauterine pregnancy should be thought of when a woman of child-bearing age gives a history of sudden, severe pain in the region of the ovary, with a hemorrhage from the uterus, accompanied by collapse, and evidences of concealed hemorrhage; a pelvic mass helps to confirm the diagnosis. The more urgent the symptoms, the greater the need of operation, as the collapse is due to hemorrhage and vessels may still be bleeding or hemorrhage may be resumed. The clinical evidence is that patients do die of hemorrhage, experiments on dogs to the contrary notwithstanding. Pathology indicates and clinical evidence teaches that prompt surgical measures will decidedly lower the mortality. Suprapubic instead of vaginal incision should be chosen in all unruptured cases, and in most old cases, unless contraindicated by sepsis or pus accumulation. No vaginal puncture or exploration should be undertaken for diagnostic or therapeutic purposes unless preparations have been made for immediate laparotomy.

Embolic Aneurisms

DRS. V. L. SCHRAGER AND DEAN D. LEWIS, Chicago: This paper deals with four aneurisms observed in three patients suffering with endocarditis. The relationship between embolism and aneurism formation has been definitely established, as in some cases the sharp, calcified embolus has been found in the aneurismal sac; while in other cases the bacteria which have been recovered from the aneurism were the same as those found in the vegetations upon the valves of the heart. About sixty cases of aneurism of this type are recorded in the literature. The frequent involvement of the cerebral and superior mesenteric artery is noted. It is interesting that veterinarians have recognized for some time the occurrence of parasitic aneurisms in the horse, the *Strongylus armatus* being found in the sac. These aneurisms develop most frequently at the bifurcation of arteries where the emboli are apt to lodge. Embolic aneurisms differ from the ordinary type in that they are often multiple. Four and five aneurisms have been seen in the arch of the aorta, while in some cases a brachial aneurism has been associated with one of the superior mesenteric. In one case an aneurism of the right brachial and right popliteal aneurism developed almost simultaneously. The diagnosis is readily made when the aneurism develops on peripheral arteries. But one case is recorded in which the diagnosis of aneurism of the superior mesenteric artery was made during life.

Medical Treatment of Exophthalmic Goiter

DR. D'ORSAY HECHT, Chicago: In our modern conception of the therapeutics of exophthalmic goiter I think we need take into account little else than a consideration of the efficacy of bed rest and serum, on the one hand, and bed rest and surgical intervention, on the other. This abridgement of the subject-matter appeals to me as both convenient and ample for current discussion. Eulenberg has probably been the staunchest protagonist of the medical treatment of this dis-

case, and his defense of it is based on a consideration of 600 carefully recorded cases. He has taken the stand that exophthalmic goiter should not even be regarded as debatable borderland, and that we should not swerve to the surgical side until the medical treatment is regarded as entirely hopeless. Perhaps in the light of increasingly convincing surgical statistics of a most favorable kind Eulenberg will recede from his original position. The rest cure remains probably the essential, if not the only rational, medical treatment, and when it is advised it should not be done indifferently, but with due emphasis as to the exact length of time the patient will be required to remain in bed. Patients are more readily reconciled to a bed rest régime when one specifies that it is to take place for two, three, four or six months. The technic, in a general way, is much the same as that applied in the so-called Weir Mitchell treatment. The earlier these patients are subjected to this treatment, the better, and I might add that the neurologist not infrequently is the first to see them, at which time they present merely quick fatigue nervousness, sweating, feelings of anxiety and apprehension, together with marked sleeplessness. There can be no doubt that bed rest when given early has a most profound influence for good on the toxemia.

In my hands antithyroidin Moebius has given some satisfaction. This product is derived from thyroidectomized sheep. It is put up in small vials of 10 c.c. and kept stable by the addition of 0.5 per cent. carbolic acid solution. It is given by mouth in an ascending dosage of from 5 to 40 or 50 drops diluted in a wine glass of water three times a day, after meals. My experience with it has been rather gratifying in the eight cases in which it was used, and I may add without serious or even adverse results. In two patients there was an increase in symptoms, with a slight rise of temperature that called for its discontinuance. In no case was it used for longer than six weeks, nor was the dosage ever carried beyond forty drops. Rogers and Beebe have been the latest investigators in the field of serotherapy in this disease, their product being referred to as a specific (cytolytic) serum, derived from human thyroid glands. They report its use in many hundreds of cases, but dwell particularly on a series of 105 patients personally treated by Rogers, up to Jan. 1, 1908, giving results which are relatively good, although to me not entirely convincing. Their serum is given hypodermatically under the skin, preferably on the outer upper aspect of the arm, at the lower insertion of the deltoid, and they report in many cases a local and in some a systemic reaction of considerable intensity. Although their arguments in behalf of a specific serum are sound, nevertheless I doubt if in our present state of serologic therapy a specific serum can be made that will not of necessity contain substances so toxic for the body as to be harmful and ever dangerous. If we could produce a serum that would be specific for thyroid and neutralize only the toxins of hyperthyroidism without in any way influencing other metabolic processes, then indeed we would arrive at an ideal solution of the therapeutic problem of this disease. That would put surgical intervention into disuse. Of organotherapeutic specialties, or of the value of electrotherapy I need say little except to emphasize their negative value. The symptomatic remedies that have at one time or another been used are quinin hydrobromate, grs. 5, combined with ergotin, gr. 1, a formula strongly advocated by Forelheimer, who records good results in over 40 cases. My experience with it is limited and not gratifying. A long list of remedies might contain a few that could be considered of avail but not necessarily of much service. I may recommend, however, administration of small doses, from 15 to 30 grains, of sodium phosphate given with water, three times a day, after meals, particularly in early cases in which the patients are taking the rest cure. Whether this acts only as an eliminant and so reduces the toxemia, I do not know but I can subscribe to its good effect. Where there is diarrhea and the sodium phosphate has a tendency to increase it, it is well to substitute the phosphate of potassium, as recommended by Bramwell. In conclusion, I would say that called on to treat a case of incipient Graves' disease, I should encourage immediate bed rest with a view to early operative interference. In advising the latter I would specify and insist if I dared that only a surgeon competent and experienced in thyroid surgery be called on to perform operation. I believe that to temporize and to tide patients over from

one exacerbation of acute thyroidism to another and so on for several periods before advising operation means subjecting them needlessly to constantly increasing toxemia, diminished resistance, goiter heart, etc., eventually bringing them into the realms of a high mortality.

Surgical Treatment of Exophthalmic Goiter

DR. CARL E. BLACK, of Jacksonville, reviewed the principles connected with the surgery of the thyroid gland. He compared the surgical with the medical treatment; how and why cases should be selected for surgical in preference to medical treatment, and cited an illustrative case.

Thyroidectomy for Dementia Præcox

DR. ALLEN B. KANAVEL, Chicago, presented a preliminary report of the results in 10 old cases of dementia præcox. Following Berkeley's suggestion of the relation of the thyroid gland to dementia præcox and his report that certain patients had been benefited, and through the courtesy of C. C. Willhite, several well-established cases of dementia præcox were placed under the observation of Dr. Louis J. Pollock, who made a careful study of the condition for a number of weeks. These patients have been operated on in association with Dr. Eustace, and the glands have been carefully studied from the pathologic point of view in association with Professor F. R. Zeit. Microscopic sections of the gland were shown and the clinical histories of the cases following operation were discussed with a short review of the results in this series of old cases and in the series of early cases reported by Berkeley.

Medicolegal

Liability for Bad Effects of Indicated Second Operation—Admissibility of Radiographs—Future Pain and Suffering

The Supreme Court of Pennsylvania lays, in the personal injury case of Wallace vs. Pennsylvania Railroad Co., that on September 7 the plaintiff, while a passenger, was injured in a collision between two of the defendant's trains, sustaining a fracture of both bones of his left limb between the knee and ankle. He was at once removed to a city hospital, where he was placed in charge of a physician and surgeon in the employ of the defendant company, who proceeded without delay to place the injured limb in alignment and apply splints. The plaintiff remained in the hospital under treatment for nearly a month, when, being able to go about on crutches, he was

taken to his home. About the middle of November following, the same surgeon removed the plaster cast and directed moderate use of the limb.

The plaintiff testified that after the removal of the cast he suffered pain in his limb so severe that he was scarcely able to endure it. Because of its continued severity, he procured radiographs to be taken of the injured part, and, in view of what these were supposed to disclose, he employed a surgeon of repute. The latter, from an examination of the radiographs and the patient, concluded that what caused the pain was an overriding of the fibula to the extent of three-fourths of an inch, and that an operation was necessary to make the small bones unite squarely, and thus relieve the pressure on the vessels and nerves of the foot resulting from the overriding. The operation involved not only an incision, but a severance of the bones which had partially united, the removal of the oblique ends, and the bringing them into a more perfect apposition and securing them in proper place by artificial tendons. This operation was performed by this second surgeon, with the assistance of another surgeon, and in the presence of several, at the same hospital where the patient was first treated.

This second surgeon testified that he found the conditions to be just as the radiographs represented them, and in addition he found the tissues about the place of fracture devitalized; the blood supply having been interfered with by the pressure of the bone.

Several months later another operation was required for the removal of a piece of dead bone which resulted from the devitalized tissues.

The railroad company contended, among other things, that if the jury found that the second operation caused the dead bone, and that this dead bone was not a sequence or result of the original injury, they should not take this dead bone into account in making up their verdict. But the court thinks that this point was rightly refused because it did not comprehend sufficient matters of fact to justify the conclusion sought to be drawn. If the operation was performed in good faith, before the recovery of the plaintiff from the original injury, with a view to promote and insure complete recovery or mitigate the plaintiff's pain, either by correcting what had been done or by supplementing it, by a surgeon in whose skill and judgment the ordinarily prudent person would have a right to rely, the consequences following the operation and resulting directly therefrom were in a legal sense the sequence and result of the original accident.

The court also considers that it was entirely proper to allow the second surgeon to state the grounds on which he based his conclusion as to what caused the pain from which the plaintiff suffered, and prevailed with him in determining that an operation was necessary. His conclusions were based largely on what the radiographs revealed. This circumstance made the radiographs admissible in evidence. While it was not a material inquiry in the case whether the operation was a prejudicial one or not, if made in good faith by one on whose skill the plaintiff had a right to rely, yet it was around this question that the controversy was waged; the defendant company insisting that no excuse whatever existed for the operation. Under such circumstances it would have been most unjust to the witness to refuse him permission to show by the radiograph what directed his judgment. He testified that when operating he found the conditions to be just as the pictures represented. In view of this testimony the objection that they were not taken by a professional came to nothing.

Again, the court says that nothing is better settled than that in cases of personal injury pain and suffering are to be reckoned as distinct elements for which compensation is to be allowed. It is equally well settled that this rule admits of compensation for future as well as past pain and suffering.

With what degree of certainty must it be made to appear that the future pain and suffering will ensue before compensation for them can be allowed?

In the multitude of cases of like character which have come before this court for review, one unvarying rule has been observed regarding the quantity of proof required, and it is this: The jury may and should award compensation for future

pain and suffering whenever the evidence furnishes just ground for the belief that such pain and suffering will likely or probably ensue. This standard has met with the approval and sanction of this court in every case, and that without qualification.

With such explicit and repeated recognition by the Pennsylvania courts of a rule which admits compensation for pain and suffering likely to ensue, it comes to nothing to show that in some jurisdictions recovery for these is allowed only when it is made to appear that they are reasonably certain to result. This court is not called on to vindicate the justice or reasonableness of the rule which obtains in Pennsylvania. It is only necessary to assert it and express the court's continued adherence to it. All that is required in Pennsylvania is that there be sufficient evidence from which the jury may fairly derive the conclusion that the chances that the plaintiff will endure future pain and suffering preponderate over those that he will not. Such preponderance denotes probability or likelihood, and that is sufficient.

Requisites to Liability of Parents for Failure to Provide Medical Attendance for Minor Child

The Supreme Court of New Jersey says that in the case of *State vs. Watson and wife*, where the defendants were convicted of manslaughter, the specific charge was a failure to provide medical attendance for their minor child, aged 7 years.

The court, however, does not find it necessary to consider the interesting, and, in New Jersey, novel question which was argued as to how far the religious belief of the defendants, who were Christian Scientists, would excuse them. It simply holds that the conviction could not be sustained under the New Jersey statute because the jury had no opportunity to find whether the neglect was wilful.

The case was tried, apparently, the court says, without regard to the New Jersey Act of March 22, 1901, which provides that any person having the care, custody or control of any minor child, who shall wilfully neglect to supply the same with sufficient food, clothing, and regular school education, or who shall wilfully abandon or neglect the same, shall be guilty of a misdemeanor. This act did not seem to have been called to the attention of the trial judge, and he, therefore, did not put to the jury the question whether the parents had wilfully neglected the child. However strong the evidence may have been on this point, the defendants were entitled to the verdict of a jury thereon.

Instead of submitting this question, the case was tried as arising under the common law. The judge properly charged the jury in one part of his charge that the defendants could not be convicted unless the jury found that they were guilty of culpable negligence, and in another part of the charge he put to them the question whether the child died as the result of their being grossly negligent; but in other portions of the charge he told them that, as it had been proved that the defendants did provide medical attendance, they must consider whether they provided this aid with the same diligence that a reasonable and prudent person would have done, and subsequently charged that, if they found that the defendants called in medical aid as soon as a reasonable and prudent person would have believed it to be necessary, the verdict must be not guilty, and toward the end of his charge the judge defined negligence as the omission to do something which a reasonable man, guided by those considerations which ordinarily regulate the conduct of human affairs, would do, and that in this case negligence, if it existed at all, was the failure to observe, for the protection of the interests of another person, that degree of care, precaution and vigilance which the circumstances justly demanded, whereby others suffered injury—failure to do what a reasonable and prudent person would have done.

The Supreme Court thinks that the effect of this charge was to allow the jury to infer that the defendants had been grossly and culpably negligent if they failed to furnish medical aid with the promptness of a reasonable and prudent person. This ignored the distinction between such negligence

as forms the basis of civil liability and that gross and more culpable negligence which is required at common law to constitute a crime. The charge was therefore faulty as a definition of the common-law offense.

The court also says that under a somewhat similar statute to that of New Jersey it has been held in England that the religious belief of the parents was not a sufficient defense. *Queen vs. Senior* (1899), 1 Q. B. 283.

Law as to Privileged Communications Not Abolished

The Court of Appeals of New York says, in the case of *Hömnnyack vs. Prudential Insurance Co. of America*, that, by the first section of Chapter 331 of the Laws of New York of 1905, Section 834 of the New York Code of Civil Procedure, which prohibits physicians or professional registered nurses from disclosing professional information, was amended by adding a provision intended to remove the privilege, and permit the disclosure of information acquired by physicians or nurses in treating their patients, where it should appear that the information so acquired indicated that the patient had been the victim or subject of a crime. Then Section 2 of said Chapter 331 provided: "Nothing in this act contained shall affect any actions or proceedings now pending." But the court holds that the plain meaning of this was that the amendment added to Section 834 by Chapter 331 of the Laws of 1905 should not affect any pending actions or proceedings. It was the amendment which was not to have any effect on suits already begun. The provision had no application to the pre-existing part of the section which remained unchanged by the amendment. That was left still in full force and effect. Under the contrary construction contended for, the court would have to hold that the legislature had abolished the law of privileged communications in favor of physicians so far as that law may have been applicable to innumerable litigations then pending in New York state. An intention thus to change a long established rule of evidence should not be imputed to the lawmakers in the absence of a clearer manifestation thereof than was to be found in this amendatory statute.

- 5 *Adams-Stokes Syndrome (Heart Block). A. A. Robinson, Ogden, Utah.
- 6 The Present Status of Prostatectomy. J. B. Squier, New York.

5. **Adams-Stokes Syndrome.**—Heart block, according to Robinson, is not a specific disease, but a combination of symptoms in which the Adams-Stokes syndrome is constant. Its etiology, therefore, varies with the individual case; its effects are most noticeably shown on the vascular system, the other organs suffering as a result of the faulty cardiac action. Though varying in degree, a slowing of the ventricular action is a constant feature: the ventricular beat may be from twenty-three to twenty-eight a minute. Because the right auricle does not empty itself, it becomes distended and by back pressure produces a congestion in the great vessels of the neck. The cerebral symptoms are due to the reduced flow of blood from the left ventricle and may manifest themselves as convulsions, epileptiform attacks, vertigo, syncope or coma. The prognosis in this condition is bad and there is no very satisfactory treatment.

8. **Cutaneous Cyst Formations.**—Robinson gives the results of his studies of those pathologic conditions of the skin described as follicular cysts, horn cysts, sebaceous cysts, comedo and milium. He states that there has been more or less difference of opinion regarding the mode of origin, the anatomic seat, and the structure of these lesions. In his opinion the views given by a majority of writers on dermatology are not the result of personal experience but merely the reiteration of statements of previous authors. According to Robinson, cysts of the pilosebaceous system should be classified according to the character of their contents as horn cysts, mixed cysts and sebaceous cysts. It is possible, he believes, for a pure horn cyst to exist but not for a pure sebaceous cyst. A sebum cyst never arises primarily in the secretory part of the sebaceous gland nor in a special excretory duct of this structure, but always in some part of the common excretory duct of the pilosebaceous system. On the other hand, a pure horn cyst may be found in the follicle opening or on one side of the excretory duct and by changing the position of the orifice may make it invisible or appear to have no connection with the cyst. Whether a horn cyst appears as a milium-like body or not, it usually arises from the external root sheath of the hair. In some cases it is due to misplaced embryonic rudiments from follicle or epidermis when the cyst is separated from the follicle. An isolated cyst may arise from the horn cyst and appear later as an independent formation. Robinson closes his paper with the description of a case in which the objective characters resembled the comedo or milium condition, in fact, it was regarded by several dermatologists as an atypical form of one or the other of these formations. Robinson is of the opinion, however, that it was an independent condition, a clinical entity, and one which he has been unable to find described in literature on cutaneous diseases.

22. **Ligation or Excision of Thrombosed Veins.**—Williams analyzes the reported cases of ligation or excision of thrombosed veins in puerperal pyemia and finds that the gross mortality does not differ materially from that following expectant treatment. By deducting incurable cases and those in which the technic was faulty, a corrected mortality of 21.4 per cent. is obtained for the transperitoneal method of operation. Williams reports five cases with a mortality of 20 per cent.

The indication for the operation is given whenever a positive diagnosis can be made by feeling a worm-like mass at the outer portion of the broad ligament, in patients suffering from chills and a hectic temperature. In case the thrombosed vessels can not be palpated through the vagina, the determination to interfere should be governed entirely by the general condition of the patient and if this is serious and shows no signs of improvement, the abdomen should be opened, provided that peritonitis or broad-ligament abscess has not developed. Excision of the thrombosed vessels is rarely necessary and only when the vessel appears likely to rupture or is surrounded by periphlebitic inflammation should it be substituted for ligation. If there is reason to believe that the hypogastric veins are involved, they should be exposed and ligated before closing the peritoneal incision over the spermatic vein. The prognosis becomes more serious in proportion to the number of veins which must be ligated. The transperitoneal is preferable to the extraperitoneal route. It is technically easier, affords a much more extensive view of the vessels, and with proper precautions, scarcely increases the likelihood of peritoneal infection. The vaginal route suggested by Taylor, Latzo, and others is applicable only to a small class of cases in which the thrombotic process is limited to the vessels of the broad ligament. As such diagnosis can not be made Williams considers that laparotomy should be done in all cases in which interference appears to be indicated.

29. Bone Ash in the Diet of Dogs.—Lothrop employs bone ash in metabolism experiments on dogs, because he finds that it lessens putrescence of the feces and makes the feces more convenient to handle. His experiments were undertaken to determine whether this use of bone ash affects the metabolism in such a way as to interfere with metabolism experiments. He concludes that the use of bone ash seems to offer no metabolic disadvantages whatever.

34. Gastric Ulcer.—The treatment which Lichty uses in most cases is similar to that first described by von Leube and Ziemessen, except that he uses a more mixed diet when he begins feeding by mouth. The 140 cases are divided into three classes according to treatment. The first class consisted of 92 patients who were treated by diet, medication and other measures. Of these, 3 are unimproved, 52 improved, 33 well, and 4 have died. The second class consisted of 32 patients who were treated by rectal feeding. Of these, 8 improved, 22 are well, and 2 have died. The third class consisted of 16 patients and includes those treated surgically. Of these, 1 is unimproved, 6 are improved, 7 are well and 2 have died. The mortality in the 140 cases is 5 per cent. Four of the 8

patients who died became carcinomatous and 3 died of perforation. The number of cases which Lichty has studied in this compilation, while not large enough to furnish conclusions, serve as the basis for the following observations: 1. The 140 cases reported occurred among about 1,395 gastric cases, which are included in over 8,000 patients which make up a general practice. 2. The mortality need not be high. The most frequent cause of death is cancer, the next frequent is perforation. Death from hemorrhage in an uncomplicated ulcer did not occur in the series. 3. The medical treatment of gastric ulcer gives results which show that it has a definite place in the general treatment of gastric ulcer, and only those cases having certain complications become surgical.

35. Idem.—According to Muller the indications for surgical treatment are perforation, repeated hemorrhage, pyloric stenosis, perigastric adhesions, dilatation and hour-glass contraction. Symptoms indicating disturbance in secretory function which fail to respond to prolonged medical treatment, and especially when motor disturbances become prominent, should lead to operation. The most important point in the surgical treatment, to the general practitioner, is the after-history of patients on whom gastrojejunostomy has been performed.

37. Fumigation and House Isolation in Contagious Diseases.—Youngman says that in Williamsport for the past two years they have used for fumigation in contagious diseases a pint of 40 per cent. formaldehyd to 8 ounces of potassium permanganate for each 1,000 cubic feet of space. With this process they have had no trouble. It is quick and effective, a saver of time and apparatus, and comparatively safe. He upholds the criticized rule, that where a case of scarlet fever or diphtheria exists and the patient is effectually isolated in a remote part of the house with a nurse, holding no direct communication with the rest of the household, and the physician in attendance gives assurances that this will be carried out, the health board, if satisfied that the public will not be endangered, will omit the placard. This works, particularly in hotels and boarding houses, with benefit to the people directly concerned; prevents loss of business, and also the sequestering of cases. Placarding is done to protect the public. If the public is protected by as complete isolation as is possible in any house, what is the use of simply advertising the disease? Absolute quarantine with guards is usually only a bluff. It can be, and is, broken in spite of all guards, if the quarantined people are so inclined. To carry out absolute quarantine would be so expensive that the city fathers would succumb to financial nightmare, and then it would be ineffectual. So the best we can do is to persuade and educate the people by word of mouth and printed rules bearing on the particular disease in question. This works well with the great majority. With others, force is necessary.

61. **Surgery of the Stomach.**—Deaver discusses gastric ulcer and its complications, malignant disease, gastropnoia and dilatation of the stomach. He insists on the great frequency of ulcer, and says that a long rest in early cases is the essential indication; but it has been abundantly proved that it is impossible to provide rest by medical means for a sufficient time to permit a cure in the majority of cases. Gastric drainage is the solution, and gastroenterostomy, the treatment of choice in cases of simple chronic persistent symptom-giving ulcers of the stomach and duodenum. In regard to cancer, he insists on the importance of acting on suspicion. There is little use in the practitioner bothering his head about a diagnosis if he insists on certainty. By the time he is certain of his diagnosis, he is also certain of a prognosis. "The latest device which has been invented to defer operation until it is too late is gastric analysis." In dilatation of the stomach in the presence of a patulous pylorus an operation may be serviceable and give truly brilliant results. Deaver has never seen a fatal case of acute dilatation of the stomach, such as is described in the literature, which fact he attributes to the early and free use of the stomach tube in all cases which show accumulation of fluid or gas in the stomach. The treatment of dilatation is early recognition of the onset and prevention by means of lavage. Elevation of the foot of the bed, by preventing sagging downward of the stomach, and the obstruction of the duodenum by the root of the mesentery as the intestines prolapse downward, may be valuable adjuncts, whether in primary cases or as a complication.

62. **Cold in the Head.**—Grayson says that the treatment of this condition has not advanced much from that employed by our professional grandfathers, or even apparently from the period of the Egyptian dynasties. Besides the microbic infection, there are commonplace non-microbic colds in the head, due only to exposure and chilling, and not free from the possibility of serious results. Underlying all acute cases of rhinitis is a chronic catarrhal rhinitis. If we were to imagine a perfectly normal man, a severe chilling would be followed by no more than a transient congestion of the internal structures, with a coincident rise of temperature, which would disappear under the recovery of control by the vascular inhibitory mechanism. In the physical degenerate man of our acquaintance, however, there are so many spots of enfeebled resistance, so many of actual, or more or less latent, disease, that a severe chill is almost certain to be followed by a tedious struggle to overcome the ill effects. Grayson believes that back of the predisposing chronic rhinitis is always an equally chronic predisposing intestinal toxemia. He holds that an acute coryza represents the results of a triple pathogenetic alliance—a chronic rhinitis, a chronic intestinal toxemia, and an exposure to an accidental stress of some kind, not necessarily thermometric or hydrometric, for just as effective as these are others of an emotional, dietetic, dynamic or microbic nature. Although in all cases the general principles of treatment will be the same, considerable discrimination in the matter of detail must be exercised in the individual case, because of the varying nature of the exciting cause. The rational treatment

for acute rhinitis will be directly and vigorously addressed to the predisposing systemic conditions. Begin with a cathartic dose of one of the natural saline waters. The patient should fast for twenty-four hours, and several times during this period he should, for fifteen or twenty minutes, indulge in the most active exercise of which he is safely capable. For those to whom, owing to age or some organic unsoundness, it would be unsuitable, the cabinet bath or some other non-depressant method of promoting diaphoresis is to be preferred. If drugs must be used, to fortify the patient's confidence, let them be only such as will harmonize with the foregoing therapeutic plan—the salicylates or their synthetic substitutes, the saline laxatives on rising and retiring, a few minims of aromatic spirit of ammonia or tincture of nuxvomica. These may not help very greatly, but at least they will not delay the relief afforded by the hygienic measures. Local treatment can be no more than palliative. Before making any application or even spraying, it is wise to reduce oversensibility by a preliminary spray of 1 or 2 per cent. solution of cocain. Two or three drops of this should be used in each fossa. A small tuft of cotton on a light and slender applicator, moistened with the 2 per cent. cocain solution, carried up to the middle turbinates, will enable us to reach and flush almost the entire nasal chamber with an alkaline antiseptic wash. The mucosa should be covered with a protective and soothing fluid or powder: Two parts of zinc stearate, with menthol, and one part of zinc stearate with balsam of Peru, dusted throughout the fossæ from a nasal insufflator.

66. **A Health Commissioner's Reminiscences.**—Reynolds interestingly reports his ten years' experience as health commissioner for Chicago, in reference to the water supply, milk inspection, antitoxin treatment of diphtheria, vaccination and smallpox, infant feeding, venereal diseases, and the sterilization of criminals.

68. **Christian Science.**—Kohn gives an admirably reasoned exposition of the factors that enter into Christian Science success, notably self-limiting of disease, diseases of spontaneous remission, the effect of fear, coincidence, etc. Many interesting examples are given of cures subsequent to the adoption of Christian Science, which are clearly coincidental. The following is a typical case: An old lady was suffering from what we may term recurrent hysteria with melancholia. The attacks, which were accompanied by fits of profound mental depression, usually lasted from six to twenty months, and she had a number of such attacks, each of which was followed in the past by freedom from the disease for from six to eighteen months. When Kohn first called to see her, she had rapidly drifted from doctor to doctor, had even tried osteopathy, and at the time of his first visit he saw a copy of the "Key to the Scriptures" lying on her table. After a time she recovered, and as usual came a relapse, and after a year or more at the various sanatoria she, for the second time, embraced Christian Science, and, wonders to behold, in three weeks she was well. She now forgets that she made similar recoveries long before the days of Eddyism, and could not possibly be convinced that what she thought was a marvel from on high, was merely a coincidence, and that the tractors, or blue glass, or Dowie could have done the same, providing her time was up. She even forgets her former fruitless study of Christian Science. What is more, when the vicious circle swings around again, she will have another attack, in spite of the "Key to the Scriptures," which will probably look tarnished by that time.

72 Trifluorol Neuritis Treated by Alcohol Injections. R J Walker, Saugatuck

69 Incipient Tuberculosis.—Johnston says that too many wait until bacilli are present in the sputum before making up their minds as to the diagnosis of tuberculosis. One has to be constantly on guard for the incipient signs, loss of weight, failing appetite, general debility, and increased pulse rate and a daily slight elevation of temperature, or many cases of incipient disease will escape notice. Repeated examinations of the chest may have to be made before distinct physical signs are detected. Of these, one of the earliest is a change from the continuous breezy, inspiratory rhythm to an interrupted cogwheel rhythm. Next in importance is the finding of fine crepitant rales on inspiration. Cough may or may not be present. Hemoptysis when present, is most important. Ninety per cent of cases of hemoptysis are said to be followed sooner or later by evidences of pulmonary tuberculosis. Percussion of the chest is frequently negative in the incipient stage. One of the most reliable signs of consolidation is the whispering voice sign. Johnston's experience leads him to believe that the ophthalmic test is much less reliable than the hypodermic test in incipient disease. Recent investigations have shown tuberculosis to be much more prevalent among infants and children than it was formerly supposed to be. He particularly emphasizes the fact that fine crackling rales often constitute the only physical signs to be found in incipient cases of pulmonary tuberculosis, and if they are persistently localized in one lung, they may be considered almost pathognomonic of this disease.

8 Vaccine Treatment of Double Pneumonia Following Childbirth.—Batten reports the case of a woman of 27 who had an attack of influenza with bronchitis, beginning three weeks before her confinement and from the effects of which she had not fully recovered. Four days after delivery pneumonia began in the left side and on the fourteenth day after her confinement an alarming dyspnea occurred which was attributed to infarcts of the lung. Examination of the sputum and also of swabbings of the uterus showed pneumococci. From these organisms a vaccine was prepared and injected. The patient's condition which had been desperate, improved forty eight hours after injection and a repetition of the vaccine treatment was followed by further improvement. The opsonic index to the pneumococci which was 0.49 rose to 1.43 after the injection. The injection of a double dose nine days after increased the index to 1.5. There was gradual convalescence and complete recovery. In Batten's opinion her recovery was due to the vaccine injected.

13 Partial Thyroidectomy.—Dunhill bases his conclusions on his experience in 113 operations in which partial thyroidectomy was performed in the great majority of cases (88) for exophthalmic goiter. All the latter patients had been treated medically until it had become apparent to the physician or the patient that improvement was not taking place. The author believes that in patients who are not definitely improving under medical treatment there can be no question as to the necessity for surgical interference so that a state of equilibrium as regards the output of thyroid secretion may be regained and maintained. He believes that there is no need to fear death either at or following operation, provided it is performed under local anesthesia. Dunhill divides the cases into four classes. 1 Cases presenting all the classical signs, but without organic heart disease, in which the patients are still able to do some work. 2 Cases with classical signs and organic changes in the heart. 3 Cases with incompletely developed signs but often presenting great toxemia. 4 Exophthalmic goiter secondary to ordinary goiter. In regard to response to operative treatment, cases of the first class are very favorable. Practically complete recovery can be promised and the period of convalescence is short. Cases of the second class are usually regarded as too far advanced for operation but in Dunhill's opinion this statement is not true. He would go so far as to say that no case, unless the patient is almost moribund, is too far advanced to obtain immense relief from operation. The extent of relief is in inverse ratio to the extent of organic heart lesion. Under local anesthesia the danger of the operation, even in the most advanced cases, is practically nil. The third class of case he regards as the worst type to handle. There appears to be an altered secretion and not simply an excessive one. Removal of half the gland does not give the relief of certain symptoms that it affords in typical cases. Every patient should be treated medically, for three months, and if there is continuous improvement medical treatment should be persevered with. Operations should be performed as soon as it is recognized that the patient is not improving. At the same time, it should be clearly recognized that it is practically never too late to operate, and that the operation in itself need never prove fatal if performed under local anesthesia. Under general anesthesia the operation can not be recommended as safe. Local anesthesia makes it possible to avoid injury to the recurrent laryngeal nerve, as the effect on the voice from pressure on this nerve may be immediately detected. The danger of injury from vomiting is also much less. The anesthesia is usually very good, though a little dragging sensation is felt while the deep connections of the gland are being divided. As much gland substance should be removed as is necessary to effect a cure, but not more. Usually one lobe and the isthmus should be removed at the first operation and half of the other lobe at a subsequent operation some months after the first. Dunhill attributes his one death to the fact that he crushed a lobe before dividing it. He believes that crushing the lobe causes a retention of toxic substances, the absorption of which may prove fatal. Avoidance of crushing and free drainage are of the greatest importance. The severity of the operation is not to be underrated. All handling should be of the gentlest nature. The vessels are increased in number and size and they are very brittle. If one gets off the track hemorrhage may be uncontrollable and, if the operation is prolonged, the bleeding is bound to be excessive.

Medical Press and Circular, London

May 19

- 21 *The Feeble-Minded and their Care. G. H. Savage.
 22 *Blackwater Fever and the Intimate Pathology of Malaria.
 C. A. Bentley and S. R. Christophers.
 23 Acute Multiple Sclerosis. H. Koch.
 24 Some Enlargements of the Kidney. L. G. Gunn.

21. **The Feeble-Minded.**—Savage lays down the following principles: 1. All persons who, whatever the form or degree of their mental disorder, are unfit to take part in the struggle of civilized life, are to be considered as feeble-minded. 2. Persons suffering from disease should be looked on rather from the standpoint of disease than with the social view. 3. If the mentally weak are to be properly recognized and treated, their condition must be reported early. 4. The control or treatment must be continued as long as needed. 5. It is essential that the whole of the insane and weak-minded should be under one definite line of control.

He discusses at length the various phases of feeble-mindedness, and dwells on recurring insanity. Such individuals can not be considered as permanently insane. Heredity is the strongest factor in these cases. Children begotten of very aged fathers are often weakminded—not from age *per se*, but because aged lust is often a sign of lack of higher control. Simple consanguinity, as in the case of cousins, etc., is not an important point *per se*; but should there be neuroses in either branch, then it intensifies the effect. He concludes that some neuroses are much more readily transmitted than are others. There is a simple all-around feebleness. Such individuals are said to be easily led; to be wanting in will and in adaptability. All these simple things are readily transmitted. Anything allied to epilepsy seems also to be likely to be represented in the next generation by feeble-mindedness. One has also to remember the child who might otherwise have developed all right, but who is affected with some acute disorder in early life, especially if that disorder be a nervous one. With care, such children may be reared and trained to become useful members of society. One child having convulsions at 2 years of age has never been the same since. Many children become weak-minded as a result of some febrile attack. Savage saw a child who was said to have had meningitis. Meningitis is sometimes recovered from, but many children who have febrile attacks have not meningitis; but they may be left permanently weak-minded. An interesting point is the frequency with which feeble-minded children are found to have had, early in life, some interference with respiration. There is a history that the child was all right until it had measles, followed by bronchitis. A still more common occurrence is to find permanent mental enfeeblement follow whooping cough. That in itself is a nervous disorder.

22. **Blackwater Fever.**—Bentley and Christopher discuss the different species of material parasite, the question of blood destruction, and find that two distinct processes may result from the action of a hemolytic serum, which they name, respectively, erythrokatalysis and dysemia: (a) An easily produced and constant effect due to the holding up in the organs and ultimate phagocytosis of red cells. (b) A condition which may or may not supervene, characterized by actual solution of the cells within the blood stream, the accompanying hemoglobinemia being followed by the occurrence of hemoglobinuria. They conclude that in blackwater fever there is reason to believe that we are not dealing with the effects of a toxin elaborated by the malarial parasite, but with the action of substances produced by the human organism itself; in other words, with the effects of an autolysin. And if human autolysin is to occur, what diseased condition is more likely to produce it than malaria? Malaria actually gives rise within man's body to the very condition we try to bring about in the attempt to produce an autolysin experimentally. Under the circumstances which appear necessary for the occurrence of blackwater fever, it is obvious that repeated and persistent blood destruction and resorption must result, and, say the authors, we see again that if this hypothesis, which is only a hypothesis, be the true one, why the malignant tertian parasite, its special action on the red cells, and consequent stimulation to their phagocytosis, should above all be the one

concerned in the causation of blackwater fever. This is hypothesis, but it may serve its purpose of indicating in a very broad and general way how blackwater may be malarial in origin and yet not be malaria.

31. **Gas in the Stomach.**—Cahill deprecates the loose manner in which the terms fermentation and putrefaction are used in reference to flatulence. He contrasts them as follows:

FERMENTATION

1. Involves carbohydrates.
2. Produces acids mainly.
3. Numerous bacteria, especially long threads and yeasts or fungi.
4. Mainly in stomach or upper portion of alimentary canal.

PUTREFACTION

1. Involves fats and proteids.
2. Produces alkalies mainly.
3. Colon bacillus mainly.
4. Mainly in lower bowel and colon.

He enumerates and describes the various causal factors in the production of gastric gas, namely: (1) Air swallowing; (2) chemie gastric respiration; (3) mechanic gastric respiration; (4) inorganic production of carbon dioxide; (5) organic production of carbon dioxide and associated gases; (6) spasm of cardia or pressure from without. He urges more careful investigation in this class of cases, in place of the resort to routine mixtures for flatulence.

33. **Erroneous Results of Testing with Only One Functional Ear.**—Yearsley says that from time to time cases have been shown, of persons hearing well after removal of the stapes or with serious labyrinthine lesions. He quotes the case of a child of 12, recently under his care, who had some carious bone removed, establishing a communication with the middle ear some years ago, and on whom he subsequently performed the radical mastoid operation, the patient making a slow recovery. In this case, the labyrinth had received sufficient damage to render the equilibratory portion functionally inactive, and it is at least doubtful whether the cochlea was intact, yet careful tests of the hearing, repeated by Yearsley himself, showed a large amount of hearing in the operated ear. The subsequent use of Barany's noise producer to the left ear, however, clearly demonstrated that the hearing of the right ear was *nil*, yet his patient, a sharp intelligent child, insists that she can hear with her right ear. Yearsley suggests that the reported wonderful cases of restoration of hearing after serious interference with the labyrinth are probably of this character.

34. **Septicemic Form of Cerebrospinal Meningitis.**—Cohen regards the microbe causing the syndrome of this form of meningitis as a special bacillus, previously confounded with the influenza bacillus. It is found in the blood and induces, besides the meningeal lesions, purulent effusions in serous cavities. The infection occurs by way of the upper air passages, and he was able to reproduce it thus at will in animals, to

vaccinate them against infection and to cure other animals with the serum of the immunized animals. In the three clinical cases reported, the first child had bronchopneumonia and left-sided purulent pleurisy besides the meningitis; the second, bronchopneumonia and empyema in the left maxillary sinus, and the third bronchopneumonia and a suppurating process in the left wrist.

37. Gastric Diseases in Children.—Fischl is professor of diseases of children at Prague, and he here remarks that congenital stenosis of the pylorus and congenital megacolon are almost unknown in his country. He thinks that this has some connection with the universal prevalence of breast nursing. He deplors the way in which subacute and chronic catarrhal affections of the stomach in children are treated by old routine methods instead of utilizing the modern means of diagnosing chronic gastric affections and thus learning the bases for effectual treatment. One great mistake of parents is in considering milk as a drink instead of a food; the children are urged to drink it in addition to their regular food; a stomach affection may often be cured by merely restricting the child to a pint of milk in the twenty-four hours. The diet should be light; the meat should be chopped fine and vegetables given in the form of purées. Constipation should be combated by suppositories or enemas, and a wet pack should be applied around the abdomen and back when the child goes to bed, and left till morning. If necessary to stimulate the appetite, he orders 10 or 15 drops half an hour before meals of compound tincture of cinchona or bitter tincture, avoiding preparations containing alcohol and glycerin. In case of much anemia he gives a little iron, preferably a mixture of 1 gm. carbonate of iron with 5 gm. sugar, divided into ten doses, two of which are taken during the day in milk. The severest cases may require lavage of the stomach and complete fasting at first. In conclusion, Fischl expatiates on the importance of curing gastric affections in children, as many adults suffering from stomach trouble can trace its origin back into childhood.

41 *Treatment of Aneurisms on the Limbs. Sencert. Commenced in No. 3

40. "Tunnelization" with Transplanted Flap in Treatment of Hypospadias.—Nové-Josserand gives a minute illustrated description of his method of remedying hypospadias and epispadias. The only objections that have been made to this method are the insufficient caliber of the new-formed urethra and the persistence of a fistula at the junction of the new passage with the old. It is easy to remedy these if they occur, the results of the technic on the whole having proved extremely satisfactory in his hands. It is applicable in all cases of loss of substance in the urethra, of traumatic or inflammatory origin, and it ensures a new and permeable urethral passage, of the proper length. The skin flap is cut from the thigh and is twisted spirally over a sound to form a tube with the raw side out, or is rolled up over the sound like a cigarette paper; the edges are caught together with very fine catgut. The sound with its outer tube of skin is then drawn into the new tunnel by means of a special clamp which bulges where it seizes the sound and skin tube, thus preventing dislodgement of the latter as the sound is pulled through the new tunnel.

41. Treatment of Aneurism on the Limbs.—Sencert gives a number of rules as to what arteries stand ligating, and the best points for the ligation, deduced from comparative study of cases in his own and others' experience, with other suggestions for treatment of aneurisms on arms and legs.

46 *Prevention of Blindness. (Prévention de la cécité dans le travail.) Metals. Id. (Traitement de l'ophtalmie des nouveau-nés par le protargol.) Id.

42. Cerebrospinal Meningitis.—Vaillard states that during the first three months of this year 139 cases of epidemic cerebrospinal meningitis developed in 45 garrisons throughout France, with 38 deaths. The value of serotherapy was demonstrated in a number of the epidemics. The patient is isolated and his two neighbors in the dormitory are also isolated for 15 days, and all the men in the dormitory are kept apart from the other troops and are examined for the germs. The rooms are disinfected. Among 372 men thus isolated 72 germ-carriers were discovered, but only one of these carriers developed the disease later.

43. Emigrants and Trachoma.—Chantemesse says that 288 persons with trachoma have been treated at the Quinze-Vingts hospital during the last two years; most of them were emigrants passing through Paris on their way to America.

44. Abscess of the Brain.—Boinet gives the details of 11 cases, study of which shows that abscess of the brain is often the manifestation of a general infection or the direct action of germs from foci elsewhere. In some cases, the pneumococcus was found in pure cultures, in others a suppurative meningitis, and in one case the abscess in the right occipital lobe was the result of puerperal infection. Operative success depends on the stage of the abscess. When intervention occurs early, the abscess is encysted and occupies only the tolerant regions of the gray substance and psychomotor centers. Later than this, the abscess spreads and entails complications.

45. Epidemic Cerebrospinal Meningitis.—Netter has had 69 cases of epidemic meningitis in his charge and estimates that there have been fully 300 cases in Paris during the prevailing epidemic. He is enthusiastic over the benefits of serotherapy, stating that it not only attenuates and shortens the course of the disease, but seems to prevent the development of sequels. He used serum of six different makes, but found Flexner's superior to the others. He continues the injections for three or four days, even when the disease seems to be favorably modified by the first injections. In one case, he made 10 injections in the course of two weeks, injecting 265 c.c. of serum; treatment in this severe case did not commence until the tenth day of the disease. He advocates injecting the serum in every case suggesting the possibility of epidemic meningitis, without waiting for the results of bacteriologic examination. No harm followed the injection in several cases in his experience in which the disease proved to be of other origin. The injection was made into the lateral ventricle in 4 infants with contractures so severe that lumbar puncture was impossible or there was reason to suppose that the communication between the ventricle and the spinal canal was interrupted. The details of 48 cases are tabulated; the list includes one of his own children, a child of 11, promptly cured by 3 injections of Flexner's serum, a total of 90 c.c. He acknowledges that he was himself the carrier in this case; meningococci were cultivated from his own nasopharyngeal mucus. He had had an intense coryza during the few days before his child's illness, following a long call on a meningitis patient whom he sent to the hospital the same day. This was just five days before his child developed symptoms. Direct contagion seemed evident in 10 of his cases, but the rarity of familial cases, the long intervals between the cases, and the almost total absence of direct transmission during the course of the disease, seem to indicate that convalescents and healthy carriers are responsible for the propagation of the disease. Nothing observed suggests direct, immediate contagion, by places or objects, while everything is in favor of the intermediation of germ-carriers and transmission by old convalescents. He found that 25.7 per cent. of 35 persons examined in 11 families, including 2 well-to-do families, were

healthy carriers. In well-ventilated apartments, in hospitals, etc., the proportion of carriers is very small, and physicians and nurses are rarely attacked. There was only a single case of the kind in the recent Silesia epidemic with 3,700 patients. His experience has confirmed the assumption that the patients retain the meningococci only a short time, and it has also shown that meningitis, like pneumonia, displays a predilection for the winter and spring months, the maximum in March. There seems to be something in the season, he thinks, which exalts the virulence of the germs of these diseases in these special months, as also possibly of influenza, scarlet fever, mumps, etc. External influences modify the virulence of the meningococci and favor their diffusion, these influences being felt simultaneously over large areas of country and affecting the germs harbored by healthy carriers. This assumption explains the almost simultaneous development of meningitis epidemics in places without direct communication.

46. **Prevention of Injury of Vision in Various Trades and in the New-Born.**—Motais has found an alarming percentage of defective vision in certain trades requiring close application of the eyes or in which these organs are exposed to injury from fumes or dust, and suggests a number of measures for prophylaxis. His suggestions in regard to prevention of ophthalmia neonatorum were given in the Paris Letter, page 1849.

48 Ring Discoloration of the Skin. (Livedo annularis.) L.-M. Bonnet.

47. **Osteomyelitis of the Vertebrae.**—Kirmisson reports a case of vertebral osteomyelitis, the fourth he has encountered in his long practice. The patient was a little girl with a spindle-shaped tumor in the left dorsolumbar region, following the direction of the sacrolumbar muscles, and fully 15 cm. long by 7 wide, the lower end on a level with the iliac crest and the top reaching to the eleventh and twelfth dorsal vertebrae. The tumor was hot and fluctuating, slightly painful, but there was no suggestion of a tendency to a gibbus and the spine could be flexed readily. The tumor had developed in the course of fifteen days; the child had been suffering from chilblains during the month or two before. Puncture revealed numbers of staphylococci, and the child was at once anesthetized and the focus opened by a long incision, and the cavity cauterized with pure carbolic acid, neutralized with alcohol; drainage was provided. The child was soon cured. He adds that it is important in such cases to avoid touching the bones, as in all cases of osteomyelitis. The bones should be left intact, and the prognosis depends on whether they are involved or not, especially whether the lesion involves the body of the vertebra or the arches. If the spongiosa of the vertebra is affected the lesion rapidly spreads and the vessels become involved, as also the venous plexus in and outside of the spine, with serious sequels and pyohemia. When the process is limited to the posterior segment, the prognosis is much more favorable. In 43 cases collected by Grisel in 1903 the body was involved in 22 with 22 deaths, and the arch alone in 21 with 16 recoveries. When the abscess is in the lumbar region the psoas muscle may become involved, with suppurative psoitis and destruction of muscular tissue; this has been observed a number of times in young children, but sequesters and fistulas are rare.

50. **Chromocystoscopy.**—THE JOURNAL, Jan. 2, 1904, page 69, published a detailed description of this new method of testing the functioning of the kidneys by the elimination in the urine of a stain injected into the buttocks. Joseph here relates his experiences with it to date, and quotes other writers who after a period of skepticism are now using the test as a routine diagnostic measure (THE JOURNAL of Dec. 5, 1908, page 2005). He states that it has fulfilled all its promises and more, and frequently does away with the necessity for catheterization of the ureters and other functional tests. In seventeen cases in which the operation was done on the findings of chromocystoscopy alone, they were confirmed in every respect. A few minutes after injection of the stain the blue urine can be seen spurting from the ureter mouths. The interval before its appearance, the intensity of the stain, the number of jets to the minute, the force of the jet—all these points are borne in mind in comparing the urine from

the two kidneys. If one ureter eliminates dark blue urine while there is no trace of the stain in the urine from the other kidney, this may be due to obstruction by a stone, to compression of the ureter by an abscess or to such extensive destruction of kidney tissue that it is impermeable for the stain. It may be important then to catheterize the ureter. With an incipient tuberculous focus, the hyperemia may induce exaggerated functioning of the kidney at first, and bacteriologic examination of the urine is then more instructive than chromocystoscopy. But as soon as this stage is past, the change in the elimination of the blue urine is so striking that the surgeon can never mistake it. In one case reported, the diagnosis of a left tuberculous pyonephrosis was unmistakable, but the condition of the other kidney was dubious, as cystitic lesions rendered catheterization of the ureter impossible; the general condition was extremely bad, and there was considerable edema. Chromocystoscopy, however, showed that the right kidney was functioning normally, and the left kidney was successfully removed. A number of such instances are related where even cystoscopy was barely possible and the mouths of the ureters unfindable. The blue jet cleared away all doubts and permitted proper treatment. It shows whether the kidney is capable of taking up from the blood the urine-producing substances and of eliminating them in due amounts and time; this information is liable to be much more reliable than that obtained from catheterization of the ureters, as he illustrates by several examples. One particularly instructive case was that of a woman requiring nephrectomy on account of multiple abscesses. The blue jet from the other kidney was normal and this kidney functioned satisfactorily until the woman succumbed to an intercurrent affection when the remaining kidney was found extremely small and not fully developed, yet its functional capacity had been ample. If its condition had been known, the surgeon would never have dared

to trust to it. The chromocystoscopy is thus a guide to the true functional capacity of the organ, regardless of anything else. In high fever the urine may turn blue in one minute instead of requiring the usual interval of five minutes. He thinks that this suggests that the general conditions in the circulation have not been sufficiently regarded hitherto in functional tests of the kidney. Joseph concludes his long article with an account of a case in which a woman complained of intense kidney stone colics, but he advised against operating, as the chromocystoscopic findings were normal. Stones voided in the urine and occasional hematuria were accepted by the surgeon, however, as sufficient reason for operating. The kidney was exposed, but found normal, and the woman confessed that she made up the stones out of tooth powder and blotting paper and pushed them into her bladder with a hairpin, with which she had also induced the hematuria.

51. Serodiagnosis of Syphilis Under Influence of Treatment.—This communication analyzes the findings in 1,512 cases of certain or suspected syphilis and 320 non-syphilitic patients. The findings confirm the specific importance of the test and show that energetic mercurial treatment is able to transform the positive into a negative reaction in a large proportion of cases. Calomel proved most energetic in this respect, with mercury salicylate next. A strong positive reaction was obtained in 23 out of 107 prostitutes, with apparently no signs or history of syphilis; the serodiagnosis is thus able to reveal syphilis in latent cases. Fourteen were given energetic mercurial treatment on the basis of the seroreaction alone, and in half of these the findings became negative by the end of the course. There were only 3 positive responses in the 320 control cases, and one of these patients had scarlet fever; another had scars suggesting a possibility of old syphilitic infection, and the third had a soft chancre which possibly may have been traceable to mixed infection.

53 Means to Prevent Conception.—Lehmann suggests that possibly the use of chemical means to destroy the spermatozoa may be responsible for certain deformities in the fetus as the spermatozoon may be injured while yet retaining vitality enough to fertilize the ovum.

56 *Stenosis of the Pylorus in Infants. (Die Pfortnerenge im Säuglingsalter.) W. Kaupé. Commenced in No 5

56 Stenosis of the Pylorus in Infants.—Kaupé has found 346 articles in the literature on this subject of congenital stenosis of the pylorus, and concludes from study of them that the etiology of the condition is still a mystery. The symptoms are sometimes ascribed to dyspepsia, atrophy, inanition, syphilis, etc., and the true cause ignored. When the vomiting is not accompanied by signs of indigestion, pyloric stenosis should be suspected, as also when the stools contain meconium and there is a tendency to constipation. Visible peristalsis in the stomach is an unmistakable sign, but it may require great patience to watch for it. Palpation of the hypertrophied pylorus (possibly under chloroform) and scanty urine further confirm the diagnosis, especially in connection with the failure of therapeutic measures. The consensus of opinion seems to be in favor of regarding the condition as exclusively belonging to the domain of internal medicine. Regulation of the diet is the main point according to most of the writers. Breast milk is preferable, drawn and given with a spoon, a little at a time every hour, supplemented possibly by lavage of the stomach. Carlsbad salts are recommended by some to prevent acidity, and opium by others, while some denounce it as liable to increase the acidity by promoting gastric secretion. Strumpell recommends atropin, Heubner tincture of valerian with a trace of opium. Magnesia proved beneficial in one case. A number of writers urge operation if internal measures do not promptly relieve, and cases are on record in which children three and five weeks old were successfully operated on.

- 64 *Perils of Hyperemic Treatment** (Ueber die Gefahren des Bluteschen Stauungsverfahrens.) A. Schafer.

57. Curable Dystrophia.—Jendrassik adds two more to the few cases on record in which partial paralysis dating from childhood was evidently the result of insufficient developing power of certain elements, and when the organism entered on a phase of exceptionally energetic growth, these elements shared in the increased vitality and developed to such an extent as to restore conditions nearly to normal. In one of his cases the improvement was probably to be ascribed to the vigorous gymnastic exercises which the patient, a young man, perseveringly kept up. The familial nature of the dystrophy was peculiarly evident in this case, as the patient's sister, brother and uncle presented the same kind of disturbances, but in them they had continued a slowly progressive course to almost complete helplessness. His other patient was a girl of ten with insufficiency of muscular action with loss of tendon reflexes and weakness in the muscles of the back, abdomen and shoulders. Two years later great improvement was apparent; the tendon reflexes were normal or nearly so, and the girl was able to take part in mountain climbing, etc., although still somewhat awkward with her hands.

59 Traumatic Neuroses.—Schlesinger raises a warning voice that the symptoms ascribed to a traumatic neurosis are liable in many cases to be due to some pre-existing affection. He was able to examine 100 victims of various accidents in the textile trades within ten days of the accident, and he was amazed at the large proportion of pathologic conditions encountered. Only 22 of the 100 persons were found normal; 58 of the others had exaggerated tendon reflexes, attenuated in 6, with complete absence in 2, the visual field was normal in only 69, only 38 were free from dermatography; 30 from tremor of the lids, and the pulse rate in 28 was abnormal. In one case the symptoms indicated intense neurasthenia, probably attributable to still manifest syphilis. If the man had not been examined early, before sufficient time had elapsed for development of a functional neurosis, the condition would have been regarded as a typical traumatic neurosis. His findings emphasize the importance of a complete examination as early after the accident as possible to detect pre-existing affections, and thus be able to separate them from new symptoms for which the accident is responsible.

60 See Berlin Letter, page 1850

63 Treatment of Alopecia Areata with Ultraviolet Rays.—Joachim gives several illustrations to show the rapid improvement under phototherapy with the ultraviolet rays. Success was obtained in many cases in which previous measures applied for months had failed to benefit.

64. Dangers of Constriction Hyperemia.—Schafer calls attention to two cases which show that there is possible danger in the application of the constricting band. In one case the Roentgen findings proved misleading and constriction was applied for supposed otitis and periostitis, when in reality the trouble was a sarcoma. The only effectual treatment, amputation, was postponed so long while hyperemia was being applied that he fears for the ultimate outcome in this case, and he warns others not to fall into this same error in similar cases of destructive processes in the bones. In the other case, neuritis developed in the radial nerve below the band, although there was no evidence of atrophy from the pressure.

66. Carcinoma in the Common Bile Duct Near the Papilla.—Morian has encountered four cases of this kind and performed a palliative operation in three, while a radical operation was possible in the fourth case, and the patient is still in good condition and well nourished, without signs of metastasis, nine months since the intervention. Patients with carcinoma of the papilla are generally seen late, when the cachexia is advanced and there is considerable cholemia, but more than half of the patients in the seven cases on record in which a radical operation was possible, survived the intervention. In his case transduodenal excision preceded the cholecystenterostomy.

68. Anastomosis of Saphenous Vein to Peritoneum for Ascites.—THE JOURNAL recently published (May 22, page 1183) an account of Ruotte's method of treating chronic ascites with cirrhosis of the liver by suturing to the peritoneum, just above Poupart's ligament, the peripheral end of the saphenous vein, severed 8 cm. above its mouth. Soyesima here reports from Kyoto three cases in which this treatment was applied with success in one case. He lauds this operation as an important addition to our surgical measures against ascites from cirrhosis of the liver. In the first case reported, the patient, a man of 38, feels constantly well, with no trace of ascites, and a year has elapsed since the operation which proved successful after omentopexy, decapsulation of both kidneys and continuous drainage of the abdominal cavity had failed to cure. In the other cases the ascites was the result of pericarditic pseudocirrhosis of the liver, and neither cardiomyolysis nor decapsulation of the right kidney, splenopexy or hepatopexy or the Ruotte operation gave relief; the latter failed also in the third case.

70. Idiopathic Osteopsathyrosis.—In Matsuoka's case the Roentgen rays showed eighteen fractures which had occurred in the course of two years; the patient was a girl of 6, whose older sister displayed the same tendency to abnormal fragility of the bones. The fractures occurred symmetrically. He insists that the affection has nothing in common with rachitis.

72. Primary Tuberculosis of the Spleen.—Ciaccio summarizes from the literature nine cases of a primary tuberculous process in the spleen and reports another from his own experience. His patient was a woman of 45, free from tuberculous antecedents or family history, and except that she was rather pale, seemed healthy and well nourished. A sensation of oppression and slight pain and tenderness in the spleen region had commenced about a year before, and the spleen was found enlarged. The symptoms were attributed to malaria, but quinin failed to benefit, and the spleen was exposed and a wedge cut out, after which the abdomen was sutured. The microscope revealed the tuberculous nature of the process and the presence of a few tubercle bacilli, and inoculated animals soon succumbed to miliary tuberculosis, so that splenectomy is advised.

 76 *Plastic Substitute for Lost Finger or Thumb and Palm. (Ersatz von verlorenen Fingern, insbesondere des Daumens, und Handtellerplastik.) K. Noesske.
 76. Plastic Substitute for Lost Finger or Thumb.—Noesske has succeeded in restoring function, after complete loss of the

right thumb, by forming a new thumb over a bayonet-shaped piece of bone taken from the tibia. The patient was a boy of 13, and the new thumb has been in use for nine months and shows no signs of absorption or shriveling. The thumb was made from a pedunculated skin flap from the chest, the pedicle cut after three weeks; the tip of the thumb was then modeled and sutured. Not until all this had healed was any attempt made to insert the bone support. Then the new thumb was incised and the piece of bone from the tibia introduced. It grew to the first metacarpal bone in three or four weeks, and there is now merely a linear scar. The boy can use his new thumb to good effect, writing well with it, and sensation is nearly normal. Noesske intends to transplant a nail from a toe to complete his work. He abstained from using a piece of rib for the support for several reasons, among them the fact that the rib tissue is liable to be more flexible and not so firm as the tibia. He reports a number of similar plastic operations on the hand.

PROCEEDINGS OF THE ATLANTIC CITY SESSION

MINUTES OF THE SIXTIETH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD AT ATLANTIC CITY, N. J., JUNE 7-11, 1909

House of Delegates

First Meeting—Monday Morning, June 7

The House of Delegates convened in the Solarium of the Traymore Hotel at 10:30 a. m., and was called to order by the First Vice-President, Dr. T. J. Murray, Montana, in the absence of President Burrell.

In calling the House to order, Vice-President Murray said: I regret very much that President Burrell will not be here on account of illness, and in his absence he has asked me to preside.

Dr. H. Bert Ellis, California, presented the preliminary report of the Committee on Credentials as Chairman.

The Secretary called the roll, and seventy-four members responded.

THE FIRST VICE-PRESIDENT: The next in order is the presentation, correction and adoption of the minutes of the Fifty-ninth Annual Session.

DR. ALEXANDER R. CRAIG, Pennsylvania: I move that the minutes of the previous session be adopted as printed.

This motion was seconded by several and carried.

THE FIRST VICE-PRESIDENT: President Burrell's address will be read by the General Secretary.

President's Address

To the Members of the House of Delegates of the American Medical Association:

It is with many regrets that I have concluded to follow the advice of my medical advisers not to attend the meeting at Atlantic City. There are a few suggestions and some recommendations that I beg to make to your body.

A question has arisen as to the wisdom of increasing the number of the members of the Board of Trustees, and of adding the President of the Association *ex officio*. I believe that it would be a mistake to increase the number of the members of the Board of Trustees, or to make the President of the Association *ex officio* a member of the Board. During the last two years I have watched with great interest the work of this body, and I have been much impressed with the judicious care that its members have taken in formulating the policies of the Association. A larger body would be less apt to be conservative, and I take it that there should be in the Association a distinctly conservative body.

Recommendation 1.—I respectfully recommend that the President and President-elect of the American Medical Association be invited, and that all of their expenses be paid, to be present at all meetings of the Board of Trustees, in order that they may be conversant with the policies there formulated. The present need, to my mind, of the American Medical Association is a more closely knit organization, and the vesting of executive power in the hands of the Board of Trustees, delegated, as it must be eventually, to the General Manager of the Association.

I think that there are too many committees in the American Medical Association which are acting more or less independently of the Board of Trustees. It is true that they are controlled financially by the Board of Trustees, but this is not sufficient; their policies should be approved by the Board of Trustees. This is particularly true of the Committee on Medical Legislation, the Council of Medical Education and the Council of Pharmacy and Chemistry. Too frequently in the past well-defined policies have been presented by committees as if they were approved by the whole Association; such policies should be presented, before they are published, to the Board of Trustees for approval. The expenses of travel of the Committee on Medical Legislation, the Council on Medical Education and the Council of Pharmacy and Chemistry should be paid for by the Association. Small, special committees

appointed for a year are undoubtedly of value, but the continuance of these committees over a number of years is unwise. Special committees have in the past been appointed by the sections, and it is my belief that these committees before publishing their reports, which too frequently appear to carry with them the authority of the whole Association, should be submitted to the Board of Trustees for approval.

The policies of all committees should be submitted to the Board of Trustees for its approval, but naturally the committees should always be answerable to the House of Delegates.

Recommendation 2.—I suggest that the defined policies of all committees and sections of the American Medical Association shall, before being issued to the public, be approved by the Board of Trustees.

Recommendation 3.—I suggest the expenses of travel of members of the standing committees, the Committee on Medical Legislation, the Councils on Medical Education and on Pharmacy and Chemistry be paid by the Association.

There is a growing tendency on the part of certain members of the Association to use political methods in influencing legislation, state and national. I believe that this movement is fraught with danger. If such work could always be done judiciously, well and good; but this influence is frequently exerted by members of the medical profession who are "babes in arms" politically. Their motives are excellent, but their discretion is open to question. The employment of one individual to serve as a lobbyist in Washington, or elsewhere, is a mistake; it is the adoption of trades-union methods, and will sooner or later bring the medical profession into discredit.

Recommendation 4.—I suggest that the Board of Trustees be requested to report to the House of Delegates at the meeting in 1910 their opinion as to the wisdom of separating the offices of Editor and General Manager and Secretary of the Association. The reason for this recommendation is not far to seek. At present the offices of Secretary and Editor and General Manager are held by one man, who, by force of circumstances, has turned on him the limelight of public opinion; he is believed to be, and as a matter of fact is, largely responsible for the policies of the Association. This is not right, nor is it fair to an individual man that he should have this great amount of seeming power placed in his hands. With the keenest possible scrutiny I have considered it my duty as President to observe the acts of your General Secretary during my years as President-elect and as President of the Association. I can report to you only that I think his work is admirable, that his acts have always been so far as was possible, judicious, and that he is deserving of the highest possible commendation for the remarkable conduct of an extremely trying double office. The recommendation that I have made as to the separation of these two offices may seem radical; all the more reason why the Board of Trustees should carefully consider and report to the House of Delegates in 1910 as to the expediency of carrying this measure into effect.

Gentlemen of the House of Delegates, the office of President of the American Medical Association is a great honor, but it should be distinctly understood that the President is practically a figure-head and not responsible for the policies of the Association. The Board of Trustees should be vested with the policies of the Association, always answerable to the House of Delegates.

I am sincerely grateful for the cordial support that you gave me last year at the Chicago meeting. My shortcomings as a presiding officer were overlooked, and a spirit of harmony prevailed which was conducive to good work. Sensible as I am that the honor of being the titular head of the medical profession of this great republic is one that can come to but few, the opportunity of meeting you gentlemen from north, south, east and west, has given me more pleasure than the honor you conferred on me.

The address was referred to the Reference Committee on Reports of Officers.

Reference Committees Appointed

The General Secretary announced the following Reference Committees:

COMMITTEE ON CREDENTIALS

H. Bert Ellis, California, Chairman.
E. W. Wels, Illinois. J. H. J. Upham, Ohio.
Oscar Dowling, Louisiana. D. Chester Brown, Connecticut.

REFERENCE COMMITTEE ON REPORTS OF OFFICERS

A. R. Cralg, Pennsylvania, Chairman.
Donald Campbell, Montana. D. S. Fairchild, Iowa.
J. W. Pettit, Illinois. E. Denegre Martin, Louisiana.

REFERENCE COMMITTEE ON MEDICAL EDUCATION

George Dock, Section Practice of Medicine, Chairman.
H. D. Arnold, Massachusetts. W. W. Richmond, Kentucky.
A. Vander Veer, New York. Members of the Council on Medical Education, *ex officio*.
Victor H. Stickney, North Dakota.

REFERENCE COMMITTEE ON AMENDMENTS TO CONSTITUTION AND BY-LAWS

H. Work, Colorado, Chairman.
Geo. W. Guthrie, Pennsylvania. Frank Paschal, Texas.
F. M. Crandall, New York. J. Shelton Horsley, Virginia.

REFERENCE COMMITTEE ON SECTIONS AND SECTION WORK

J. H. Carstens, Chairman, Section on Obstetrics.
S. S. Crockett, Tennessee. J. Howell Way, North Carolina.
L. M. Halsey, New Jersey. Thomas McDavitt, Minnesota.

REFERENCE COMMITTEE ON RULES AND ORDER OF BUSINESS

A. L. Wright, Iowa, Chairman.
C. H. Beecher, Vermont. H. F. Harris, Georgia.
J. Wythe Cook, Dist. of Columbia.

REFERENCE COMMITTEE ON LEGISLATION AND POLITICAL ACTION

Walter B. Dorsett, Missouri, Chairman.
G. L. Taneyhill, Maryland. James W. May, Kansas.
Edwin Walker, Indiana. J. W. Clemmer, Ohio.
Members of the Committee on Medical Legislation, *ex officio*.

REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

T. A. Woodruff, Chairman, Section on Ophthalmology.
J. H. Pierpont, Florida. J. D. Griffith, Missouri.
A. M. Hume, Michigan. John Champlin, Rhode Island.

JUDICIAL COUNCIL

C. E. Cantrell, Texas, Chairman.
J. H. Wilson, Delaware. H. A. Christian, Section Pathology and Physiology.
Harold Gifford, Nebraska.
C. S. Sheldon, Wisconsin.

REFERENCE COMMITTEE ON HYGIENE AND PUBLIC HEALTH

W. N. Wishard, Indiana, Chairman.
O. J. Brown, Massachusetts. G. B. Young, U. S. P. H. and
J. B. Bullitt, Mississippi. M.-H. S.
A. T. Bristow, New York.

THE FIRST VICE-PRESIDENT: The next in order is the report of the General Secretary.

The General Secretary presented his annual report as follows:

Report of the General Secretary

To the Members of the House of Delegates of the American Medical Association:

I submit herewith a report for the year 1908-1909:

MEMBERSHIP

The membership of the American Medical Association on May 1, 1908, was 31,343. During the past year 290 members have died, 1,439 have resigned, 484 have been dropped for non-payment of dues, 290 have been dropped as not eligible for membership under Section 1, Chapter I, Book I of the by-laws, and 55 names have been removed from the rolls on account of being reported "not found" or on account of mail returned by the postoffice department, making a total of 2,558 names to be deducted from the membership list. Since May 1, 1908, there have been added 5,150 names, of which 3,638 were subscribers to *The Journal* previous to becoming members of the association, while 1,512 were new members joining direct. The membership on May 1, 1909, was 33,935, making a net gain for the year of 2,592.

COMMITTEES APPOINTED AD INTERIM

Since the adjournment of the House of Delegates at Chicago on June 4, 1908, the following committees have been appointed by the president:

Committee on Patents and Trademarks: Charles S. Bacon, Chicago, Ill., chairman; Oliver T. Osborne, New Haven, Conn.; Philip Mills Jones, San Francisco, Cal.; A. B. Cooke, Nashville, Tenn.; H. C. Wood, Jr., Philadelphia, Pa.

Committee on Uniform Regulation of Membership in County and State Societies: Thomas S. McDavitt, St. Paul, Minn., chairman; Walter R. Steiner, Hartford, Conn.; Frederick R. Green, Chicago, Ill.

Committee on Elaboration of Principles of Ethics: Frederick C. Shattuck, Boston, Mass., chairman; George W. Guthrie,

Wilkes-Barre, Pa.; Stuart McGuire, Richmond, Va.; Charles R. Bardeen, Madison, Wis.; Charles A. Powers, Denver, Colo.

Committee Appointed to Represent the American Medical Association at the Conference held at Washington on the Conservation of the National Resources: John H. Musser, Philadelphia, Pa.; William H. Welch, Baltimore, Md.; Abraham Jacobi, New York City.

Council on Defense of Medical Research: Walter B. Cannon, Boston, Mass., chairman; Joseph A. Capps, Chicago, Ill.; Harvey Cushing, Baltimore, Md.; David L. Edsall, Philadelphia, Pa.; Simon Flexner, New York City; Reid Hunt, Washington, D. C.; Herbert C. Moffitt, San Francisco, Cal.

Delegates to Represent the American Medical Association in the Council of the American Association for the Advancement of Science: George M. Kober, Washington, D. C.; George H. Simmons, Chicago, Ill.

Conference Committee on Drug Reform: Lewis S. McMurtry, Louisville, Ky., chairman; David R. Silver, Sidney, O.; J. Forest Burnham, Lawrence, Mass.

The death of Dr. Charles Harrington, of Boston, shortly after his appointment as a member of the Committee on Medical Legislation, created a vacancy on this committee as well as on the Board of Public Instruction on Medical Subjects. Dr. George W. Gay, of Boston, Mass., was appointed by President Burrell to fill Dr. Harrington's unexpired term on the Committee on Medical Legislation, and Dr. Myles Standish, of Boston, to fill his unexpired term on the Board of Public Instruction on Medical Subjects.

The secretary has been officially informed that the following members of the Anesthesia Commission were appointed by the Section on Surgery and Anatomy: J. G. Mumford, chairman, Boston, Mass.; J. P. Binne, Kansas City, Mo.; C. A. Powers, Denver, Colo.; W. D. Haggard, Nashville, Tenn.; W. L. Rodman, Philadelphia, Pa. The various members of these committees were all notified of their appointments and acceptances were received from them.

COMMITTEE ON REAPPORTIONMENT

The by-laws provide (Section 3, Chapter IV, Book II, page 10) for a Reapportionment Committee in 1903, and every third year thereafter, consisting of the president, the secretary and three other members, whose duty it shall be "to examine the membership lists of the Constituent Associations and to determine therefrom the number of delegates to this Association to which each Constituent Association shall be entitled for the ensuing three years." The attention of the House of Delegates is therefore called to the necessity of appointing such a committee. I suggest that the appointment be made early in the session so that the committee may report to the House of Delegates as soon as possible.

REGULATION OF MEMBERSHIP

I also desire to call attention to the report of the committee appointed at the Chicago session on the Regulation of Membership. The importance of this subject is becoming more and more apparent as the membership of the Association and of its constituent state associations increases. If any consistent effort is to be made to enforce the constitutional provisions regarding membership, so that satisfactory results may be secured, it will be necessary to systematize and regulate this matter on a uniform basis throughout the entire organization. I therefore ask for the report of this committee the careful consideration of the House of Delegates, feeling that the question is one of the utmost importance to the future growth and development of the organization.

REVIEW OF THE LAST TEN YEARS

This session brings to a close a period of ten years during which the present incumbent has served the Association as General Secretary. It therefore seems not inappropriate that some brief review of the past decade should be made and a comparison of the conditions of medical organization in 1899 with those of 1909 instituted, in order that we may determine what progress has been made and what further advances remain to be achieved.

MEMBERSHIP

The membership of the American Medical Association in 1899 was 7,997. That on May 1, 1909, as shown in the report given above, was 33,935, an increase in the past ten years of 25,938 members or of 424 per cent., an average growth of approximately 2,600 per year. The increase in state society membership has been even more marked. Complete figures are lacking to show the membership of the various state societies in 1899. The following table, however, shows the membership of some of the state societies ten years ago and to-day:

	1899	1909	Increase
Colorado	326	739	226%
California	309	1,861	602%
Connecticut	660	872	132%
Florida	145	285	190%
Illinois	515	5,265	1022%
Indiana	1,561	2,587	165%
Iowa (Est.)	684	1,850	270%
Kentucky	500	2,231	446%
Louisiana	458	1,069	231%
Michigan	550	1,892	344%
Minnesota (Est.)	450	1,214	270%
Nebraska (Est.)	400	863	215%
New Hampshire	360	520	171%
New Jersey	854	1,400	163%
Ohio	885	3,962	450%
Tennessee	400	1,377	344%
Texas	297	3,100	1043%

These figures are incomplete, since in many cases it is impossible to find any record of membership of some of the state associations in 1899, but they show the advance that has taken place in the last ten years in many. As late as 1902, or only seven years ago, in the discussion which preceded the reorganization of the Association, the Committee on Reorganization stated that, as nearly as it was possible to determine, the total membership of all medical societies at that time approximated 34,000. To-day the combined strength of the associations constituent to the American Medical Association is 67,362.

ASSOCIATION PUBLICATIONS

In 1899 not a single state association owned and published an official state journal. To-day there are 19, as follows:

JOURNALS OWNED BY STATE SOCIETIES

- Journal of the Arkansas Medical Society, Morgan Smith, Editor, Little Rock, Ark.
 California State Journal of Medicine, Philip Mills Jones, Editor, Butler Building, San Francisco, Cal.
 Colorado Medicine, George A. Moleen, Editor, Mack Block, Denver, Colo.
 Illinois Medical Journal, George N. Kreider, Editor, Springfield, Ill.
 Journal of the Indiana State Medical Association, A. E. Bulson, Jr., Editor, Ft. Wayne, Ind.
 Journal of the Kansas Medical Society, James W. May, Editor, Kansas City, Kans.
 Kentucky Medical Journal, A. T. McCormack, Editor, Bowling Green, Ky.
 Bulletin of the Medical and Chirurgical Faculty of Maryland, H. O. Reik, Editor, Baltimore.
 Journal of the Michigan State Medical Society, B. R. Schenck, Editor, Detroit, Mich.
 Journal of the Missouri State Medical Association, E. J. Goodwin, Editor, Linmar Building, St. Louis, Mo.
 Journal of the Medical Society of New Jersey, D. C. English, Editor, New Brunswick, N. J.
 Journal of the New Mexico Medical Society, G. S. McLandress, Editor-in-Chief, Albuquerque, N. M.
 New York State Journal of Medicine, Algernon T. Bristow, Editor, 17 W. Forty-third street, New York City.
 Ohio State Medical Journal, J. H. J. Upham, Editor, 186 E. State street, Columbus, Ohio.
 Oklahoma State Medical Journal, E. O. Barker, Editor, Guthrie, Okla.
 Tennessee State Medical Journal, George H. Price, Editor, Nashville, Tenn.
 Texas State Journal of Medicine, I. C. Chase, Editor, Fort Worth, Texas.
 Journal of the South Carolina Medical Association, J. W. Jervey, Editor, Greenville, S. C.
 West Virginia Medical Journal, S. L. Jepson, Editor, Wheeling, W. Va.

In addition to the journals named above, the Pennsylvania Medical Journal, while not legally the property of the Medical Society of the State of Pennsylvania, is practically the state association journal, while the following state associations have recognized certain journals as "official organs" in which the transactions of the associations appear: Louisiana, Minnesota, Mississippi, Nebraska, South Dakota, Virginia and Wisconsin. But few of the state associations still adhere to the Transactions which were formerly the only means of disseminating matters of society interest among the members.

OTHER BENEFITS OF REORGANIZATION

The increase in the effectiveness of reorganization in county, state and nation has been marked during the past decade. Medical education, instruction of the public, regulation of pharmaceutical and drug products, the publication of an official directory of the profession, the compilation of uniform laws for the different states, are all matters in which the Association has been vitally interested since the time of its organization, but action on which, up to a comparatively few years ago, was limited to the adoption of resolutions. While these vitally important questions are by no means solved as yet, a practical beginning has been made in the permanent and equitable solution of each of them, and the Association now has permanent boards, committees and councils, striving for a careful solution of these questions throughout the entire year, instead of having to be content with a hasty and inadequate consideration of the general problems and the adoption of resolutions at the annual session, as heretofore. While an enormous amount of work remains to be done, yet the Association can well feel that a beginning has been made toward the definite solution of many of these problems. We may certainly hope to see in the near future many of the questions which have vexed the profession and the public for years past definitely and permanently settled, permitting the profession to advance to greater possibilities of usefulness to its members and the public.

Respectfully submitted,

GEORGE H. SIMMONS,
General Secretary.

The report was referred to the Reference Committee on Reports of Officers.

Dr. William H. Welch, Maryland, Chairman, presented the report of the Board of Trustees as follows, which was referred to the Reference Committee on Reports of Officers:

Report of the Board of Trustees

To the Members of the House of Delegates of the American Medical Association:

The Board of Trustees in presenting this report for the year 1908 feels that the members of the Association have just reason to be proud of the work done and of the results accomplished, not only by THE JOURNAL, but also by the Association along the various lines which have engaged its activities. The past year has been the most successful year in the history of the organization from the financial as well as from the scientific, educational, legislative and philanthropic viewpoints. Concerning the finances of the Association, a clear, complete and comprehensive statement will be found in the report of the auditing company, appended hereto, and, therefore, it will not be necessary to consider further that phase of the subject here. The various tables which have been compiled illustrating the steady and commendable growth in all the administrative and mechanical features connected with the publication of THE JOURNAL likewise have been placed in the appendix where they may be studied, if desired, at leisure.

There are a number of matters, however, to which the Board feels your attention should be particularly directed at this time and first among these should be mentioned the work which has been done by your various councils and committees. Many of the committees will report directly to you and it is therefore not the intention to enter into the details of their work at this time but merely to state that few members of the Association realize the great amount of time, energy and work which the gentlemen who are serving gratuitously on these committees are constantly giving for the improvement and benefit of the profession as a whole and the community at large. The manner in which the committee of to-day acts and does things is in marked contrast to the manner in which the committee of a few years ago resolved and did nothing, and it is this spirit or desire to do something for the benefit of all that is one of the most encouraging features of our present organization. In order to encourage and facilitate the work of these committees your Board of Trustees appropriated for their use during the past year many thousands of dollars, and the Board feels that the excellent results of their labor have not only justified the expenditure but have entitled every member of these committees to the approbation and commendation of this Association.

COUNCIL ON PHARMACY AND CHEMISTRY

Concerning the committees that report directly to the House of Delegates, nothing further need be said here, but there is one committee, namely, the Council on Pharmacy and Chemistry, which reports to the Board of Trustees, and the Trustees take great pleasure in presenting briefly something of the results accomplished by the labors of the members of this Council, results alone made possible by the fact that the work, which could not have been bought with money, has been done largely gratuitously by men of the highest scientific attainments and imbued with a purely altruistic spirit. The work done by this Council has been enormous, and the good results are far-reaching in the highest degree. Some of the results of this work have been published in *THE JOURNAL*, and with this part of it you are all undoubtedly familiar, but much of it for many reasons, which are readily apparent, can not find its way into print.

The Council is constantly examining a large number of preparations with which the profession is being exploited, and weeding out the frauds and fakes so that the physician to-day need not be deceived by false representations of agents into using or administering anything with which he is not entirely familiar. Many of these fraudulent preparations are put on the market by so-called chemical houses which exist as such only on paper, and which are organized for the sole purpose of "working" the profession or the people, usually both, with the particular fraud in question. Were the exposure of these frauds the only work done by the Council it would still be invaluable, as it is a means of accomplishing that which heretofore had been practically impossible. But this after all is but a minor part of the Council's work. There are many preparations and products placed on the market with honest intent and purpose by perfectly reputable houses, which on thorough investigation by the Council are found either to be below standard or to fall below the claims conscientiously made for them by the manufacturers. On presentation to the manufacturers of the results of the investigations by the Council many of these preparations and products are modified or more carefully standardized, or the claims made to conform more carefully to the facts, or the preparations are taken off the market, so that not only physicians but the people as a whole are constantly being benefited to a degree not realized.

In addition to the great amount of work done by the several members of the Council in their respective laboratories, the Association, as is well-known, has a laboratory of its own in *THE JOURNAL* building, under the direct supervision of Professor Puckner, where analyses of all kinds of preparations are constantly being made. The work here has grown so rapidly and has reached such proportions that the Trustees recently authorized the employment of another chemist to help carry it on. It is impossible to over-estimate the value of this work. The physician is now no longer dependent on the exaggerated, extravagant, and often untruthful and absurd statements of the advertising agent for his knowledge concerning new products and preparations, but may obtain information from a trustworthy source, which has no other aim than to make known the facts in the case. The excellent work of this Council has received general recognition both at home and abroad. It has aroused the medical profession of Germany, which is beginning to take cognizance of conditions which were not realized until this work was commenced, and in the German journals acknowledgments are repeatedly made of the work that is being done on this side.

The Trustees at their annual meeting adopted a vote of thanks to the following gentlemen, not connected with the Council, for their aid and assistance in various investigations connected with the work of the Council:

Daniel Base, Ph.D., Professor of Chemistry and Vegetable Histology, Dept. of Pharmacy, University of Maryland.
William B. Day, Ph.G., Professor of Pharmacognosy, University of Illinois School of Pharmacy.
G. B. Frankforter, Ph.D., M.A., Dean of the School of Chemistry, Professor of Chemistry, University of Minnesota.
N. McL. Harris, M.B., Assistant Professor of Bacteriology, University of Chicago.

P. G. Heinemann, Ph.D., Assistant in Bacteriology, University of Chicago.
William A. Johnson, Ph.G., Instructor in Chemistry, Northwestern University Medical School.
E. O. Jordan, Ph.D., Professor of Bacteriology, University of Chicago.
Edward Kremers, Ph.G., Ph.D., Professor of Pharmaceutical Chemistry, Director of the Course in Pharmacy, University of Wisconsin.
Henry Kraemer, Ph.B., Ph.D., Professor of Botany and Pharmacognosy, Philadelphia College of Pharmacy.
Charles H. LaWall, Ph.M., Associate Professor of Theory and Practice of Pharmacy, Philadelphia College of Pharmacy.
S. A. Matthews, M.D., Assistant Professor of Experimental Therapeutics, University of Chicago.
Herbert N. McCoy, Ph.D., Associate Professor of Physical Chemistry, University of Chicago.
W. J. MacNeal, University of Illinois.
Charles H. Miller, Ph.G., M.D., Assistant Professor of Pharmacology, Northwestern University Medical School.
Atherton Seidell, M.D., Hygienic Laboratory, Public Health and Marine-Hospital Service, Washington, D. C.
A. L. Winton, M.D., Chief Chicago Laboratory U. S. Department of Agriculture, Bureau of Chemistry.

WORK OF DR. MC CORMACK

So much that is good has been said of Dr. McCormack in the past that it is only necessary to say here that his excellent work has continued throughout the past year. We feel that he has been an educator of the profession, of legislators, and of the people, and a peacemaker to all.

THE AMERICAN MEDICAL DIRECTORY

The next subject presented for your consideration is that of the Directory. The work of revision, preparatory to publishing the 1909 Directory is at present well under way and the first forms will soon go to press. The intention is to improve the Directory with each succeeding edition. This year one of the improvements will be a more extended and complete college key table for quick reference. The college historical matter is greatly enlarged, and we believe the 1909 Directory will contain an historical review of the medical colleges and medical education of the United States more complete than can be found elsewhere. This has been obtained only after considerable labor. Additional personal information regarding individuals, such as college professorships and specialties, will be given. A large amount of additional matter has been secured since the first edition was published so that the 1909 edition will be found to contain many new personal data. The Directory should be regarded not primarily as a commercial enterprise, the fundamental reason for its publication being service to the profession and to the public. The Association is endeavoring to supply the medical profession and the public with an official register of the medical profession, comparable as an authority, for instance, to the Medical Register of Great Britain, combining, however, appropriate biographical and personal information so far as reliable data can be obtained. The book consequently should not be regarded in the first instance as a source of revenue but as an investment for the benefit of the profession and the public.

In this connection the enormous and increasing value of the mass of information of interest and accessible to the medical profession which is being accumulated, both personal and otherwise, must always be kept in mind. It is this personal information department which is really the basis as well as a *raison d'être* of the Directory.

The printed book contains only a small part of the large and constantly growing collection of data which is not only unequalled but which will be of ever increasing value to state boards, medical societies and the profession.

THE JOURNAL

THE JOURNAL during the past year has maintained its high standard of excellence. The practical and the scientific character of its articles, the broad scope of its editorials and the amount of general information from all parts of the land which it contains make it rank with the greatest medical journals of similar scope in the world. Notwithstanding the

fact that the advertisements submitted receive the most careful scrutiny, yet the constantly increasing circulation and the great popularity of *THE JOURNAL* as an advertising medium have made it possible for its pages to yield a larger revenue this past year than during any year heretofore.

ARCHIVES OF INTERNAL MEDICINE

The Board of Trustees in 1907 authorized the publication, beginning January, 1908, of the *Archives of Internal Medicine*, a journal devoted especially to the clinical and scientific phases of internal medicine. The fact that from the first it has succeeded beyond expectation is sufficient evidence that it has filled a want, but in spite of the fact that a certain number of more extensive and technical articles submitted to *THE JOURNAL* find an outlet in the *Archives*, *THE JOURNAL* is still overwhelmed with an abundance of material quite beyond its capacity to publish and therefore it is inevitable that a large number of suitable manuscripts must regretfully be returned to their authors. The circulation of the *Archives* is now about 1800, and the new journal is self-supporting.

NEW BUILDING

The Board of Trustees is called on to meet and handle many problems, but there is one question that continues to rise before it again and again. This is the question of working space in our building. When the present building was erected it was thought ample for our needs for a considerable time to come, but no one then dreamed of the work expanding so rapidly as it has. Three years ago the building was extended to the full depth of the lot and raised an additional story, which is all the walls will stand. The additional room thus acquired was soon fully occupied, and last year it became necessary again to enlarge our space by extending to the limits under the sidewalk and utilizing the space in one of our buildings next door. The relief, however, was relatively slight, and now we are once more confronted by the same problem, but in a more serious way. Additional space is urgently needed in practically every department. Since the councils and standing committees have become active working bodies and since the permanent working forces of these bodies have wisely been centralized in our own building, our entire clerical force has been augmented materially and is at present unavoidably crowded and badly quartered. We need more space for linotype machines and for our stereotyping department. We are working our men in two shifts of eight hours each and on rush days they are worked overtime in two shifts of ten hours, thus keeping our mechanical departments in operation for twenty hours out of the twenty-four. It is therefore not difficult to see the crowded and rushed conditions under which we are now laboring. Your Trustees have given this matter careful consideration for some time, and after thoroughly discussing the matter with our architects and with our general manager we are unanimously of the opinion that the only solution of the question is the erection of a new building large enough not only to accommodate us now, but to allow for our growth for many years to come. We already own the ground adjoining our present building and the available funds and securities will permit the construction and equipment of the building as proposed. In view of the urgent need of more room we believe the work should be undertaken at once. The matter is therefore submitted for your consideration. Owing to the great urgency, however, the Board has gone ahead and secured, provisionally, architects' plans and construction bids, believing that its action would meet with the approval of this body. The estimated cost of the new building, for which the plans will be submitted to the House of Delegates, including architects' fees, is approximately \$200,000. The proposed building will be about sixty-one feet by one hundred and twenty feet, six stories, and a high basement. The foundation will be driven piles and concrete and steel used for foundation to basement floor line. The building will be absolutely fireproof and the walls will be made sufficiently strong to add at least two more stories. We regret that the architects were not able to furnish the elevation plans.

CONCLUSION

The Board, in conclusion, can not refrain from calling your attention to the fact that this meeting marks the close of the most remarkable decade in the history of the organization. For fifty years previous to this period the Association had struggled along, making good resolutions from year to year, but accomplishing only a very small part of the great ends and aims of its existence. *THE JOURNAL*, with a circulation of only a little over 10,000, had little standing as a scientific periodical and was seldom quoted by the great journals of the world. The assets of the Association were nominal and it was without a fixed home. The profession throughout the land was in an incoherent, unorganized state, an easy, helpless prey to the most glaring impositions and frauds. The various committees appointed by the Association rarely if ever met, except perhaps at the annual meeting and then generally only to draw up a hasty resolution which resulted in nothing being done. But with the beginning of the past decade a new life came into the organization. *THE JOURNAL* began to make most remarkable strides forward. Its circulation in the ten years increased 500 per cent. It reaches every quarter of the globe and stands without a peer as an educator in all things scientific, political, sociological and medicolegal which in any way relate to the work. It has erected, enlarged and outgrown one of the finest medical printing plants in the world and the Association's assets extend into the hundreds of thousands.

The Association, through its active committees, has made a most comprehensive study of medical education in this country and accomplished most positive results in elevating and standardizing the same. It has made itself felt in national legislation and aided in the molding of laws to just and righteous ends. It has laid bare innumerable frauds and made it impossible for them to be longer unknowingly perpetrated on the profession and the people. It is educating the masses in general matters pertaining to medicine through its Bureau of Public Instruction; it is stimulating scientific investigation by means of rewards for original medical research and commendable scientific exhibits. Through its initiation the profession of the United States has been reorganized, or rather, organized, into an intelligent, coherent body which has come to learn its rights, to know its power and to feel its duties and obligations. All of this and much more has been accomplished in the brief period of ten years, and your Trustees feel that they would be derelict in their duty did they not add with pride and sentiments of regard that the one man above all others to whom we are indebted for these great things is our present Editor and General Manager, Dr. George H. Simmons.

As was to be expected when the Council on Pharmacy and Chemistry began the work of exposing the medical frauds and fakes that for years had been foisted on an unsuspecting profession and an innocent public, it brought down on itself and the Association a torrent of ridicule and abuse from the proprietary and patent medicine interests that were so severely hit by the exposure of their dishonest products. For three years these interests kept up against the Association and its officers a fusillade of the most scurrilous invective and obloquy which money could buy. But all to no effect. The officers of the Association were firm in the belief that the vast majority of the physicians were at all times for right, and the good work continued uninfluenced in the slightest by these railings. Failing ignominiously of their purpose in these attacks and finding that the Association continued to grow in numbers and strength from day to day, the method of attack has changed recently. Instead of hurling the forces against the Association and its general officers a most malicious and vindictive attack has been made on the honor and personal character of one who has formed the central figure of our organization for the past ten years. The animus back of this attack and the interests that are aiding and abetting it are not difficult to understand, but it will be found that this attack, like those of the past, will be shattered on the impregnable rock of a great work well done, and it will but show that the American Medical Association is founded on the righteous integrity of the great body of physicians throughout this land and that it will endure.

Dr. T. J. Happel, a member of the board, was taken ill while attending our February meeting in Chicago and never recovered. He died May 24. The board desires to express its appreciation of the devoted and valuable services which Dr. Happel has rendered the Association. As a member of the Board of Trustees for eleven years and as its chairman for seven years, his advice and assistance were of incalculable benefit to his colleagues. By his death the American Medical Association has lost a devoted and indefatigable worker, the medical profession generally, an honored member, and the country a cultured and valued citizen.

Respectfully submitted:

WILLIAM H. WELCH, PHILIP MARVEL,
MILES F. PORTER, W. R. TOWNSEND,
M. L. HARRIS, PHILIP MILLS JONES,
W. W. GRANT, W. T. SARLES.

Addenda to Trustees' Report
SUBSCRIPTION DEPARTMENT

The regular weekly issue of THE JOURNAL of the American Medical Association, from Jan. 4, 1908, to Dec. 26, 1908, inclusive, 52 issues, was as follows:

January 4.....52,880	July 4.....53,238

Weekly average.....53,978	

The following statement is an approximate count of the mailing list of the members and subscribers by states on Jan. 1, 1909. It also shows the approximate percentage of physicians in each state receiving THE JOURNAL. It does not include copies sent to exchanges, to libraries, to the government services, or abroad:

State	Members	Subscribers	Totals	Approximate Per Cent.
Alabama	344	211	555	26.2
Arizona	88	49	137	67.4
Arkansas	368	344	712	30.6
California	1,142	534	1,676	42
Colorado	472	262	734	47.3
Connecticut	428	218	646	48.4
Delaware	57	20	77	34.6
Dist. of Columbia	297	215	512	46.5
Florida	152	88	240	38.7
Georgia	340	193	533	19.1
Idaho	75	54	129	49.7
Illinois	3,312	1,679	4,991	52.9
Indiana	1,203	803	2,006	40.8
Iowa	1,061	584	1,645	46.7
Kansas	591	403	994	42.8
Kentucky	741	500	1,241	32.9
Louisiana	386	265	651	41.9
Maine	231	137	368	34.7
Maryland	513	453	966	53.3
Massachusetts	1,702	575	2,277	42.3
Michigan	1,060	815	1,875	46.1
Minnesota	839	556	1,395	71.6
Mississippi	267	236	503	28.5
Missouri	1,294	764	2,058	34.5
Montana	127	80	207	61.7
Nebraska	463	254	717	42.9
Nevada	48	25	73	52.8
New Hampshire	231	58	289	44.7
New Jersey	634	246	880	37.7
New Mexico	93	64	157	71
New York	3,141	1,589	4,730	39.4
North Carolina	241	214	455	31.3

North Dakota	182	150	332	73.6
Ohio	2,060	1,017	3,077	39.9
Oklahoma	365	335	700	37.4
Oregon	205	129	334	41.0
Pennsylvania	2,744	1,483	4,227	42.3
Rhode Island	217	97	314	43.1
South Carolina	187	139	326	31.8
South Dakota	195	129	324	59.4
Tennessee	440	225	665	22.3
Texas	1,067	624	1,691	35.04
Utah	102	78	180	59.2
Vermont	166	36	202	31.2
Virginia	369	333	702	36.09
Washington	368	240	608	59.4
West Virginia	355	158	513	36.4
Wisconsin	865	472	1,337	55
Wyoming	49	35	84	48.2

TEN YEARS' GROWTH

As this ends ten years under the present management, the following information covering that period may be of interest.

This table shows the number of members and of subscribers for each year, commencing with 1899:

	Members	Subscribers
January 1, 1899.....	7,997	2,453
January 1, 1900.....	8,445	4,633
January 1, 1901.....	9,841	8,339
January 1, 1902.....	11,107	10,795
January 1, 1903.....	12,553	12,378
January 1, 1904.....	13,899	14,674
January 1, 1905.....	17,570	15,698
January 1, 1906.....	20,826	17,669
January 1, 1907.....	26,255	20,166
January 1, 1908.....	29,382	20,880
January 1, 1909.....	31,999	*18,983

* This is not an actual loss, as 4,062 subscribers were transferred to the membership during the year 1908.

The following is the total weekly average issue for ten years:

Year	Issue
1899	13,672
1900	17,446
1901	22,049
1902	25,321
1903	28,615
1904	32,423
1905	38,006
1906	46,479
1907	52,217
1908	53,978

It will be noticed that the average gain last year fell off to some extent. This is accounted for principally by the issuance of a new order by the postoffice department regarding second-class rates which was to the effect that weekly journals can not be sent to subscribers and retain second-class rates where more than one year's credit is allowed. This order made it necessary to curtail the time given under certain conditions to subscribers, and consequently to drop a large number of names.

The following shows the steady increase of expenditures on three important items:

	PAY ROLL AND SALARY
1899	\$ 31,448.69
1900	37,359.49
1901	40,416.01
1902	46,316.65
1903	57,067.34
1904	64,471.26
1905	78,874.79
1906	96,578.71
1907	110,455.43
1908	123,893.28

	PAPER STOCK
1900	\$ 25,598.00
1901	29,835.00
1902	35,675.06
1903	43,966.57
1904	51,190.05
1905	57,526.69
1906	65,381.17
1907	89,546.80
1908	106,495.12

	POSTAGE ON JOURNAL
1899	\$ 3,905.65
1900	5,616.06
1901	7,591.37
1902	8,595.63
1903	9,828.41
1904	11,773.44
1905	14,360.28
1906	17,066.62
1907	19,203.65
1908	20,197.88

Respectfully submitted,
FRANK BILLINGS, Treasurer.

Auditors' Report

THE INVESTORS AUDIT COMPANY

CHICAGO, FEB. 4, 1909.

To the Board of Trustees of the
American Medical Association, Chicago, Ill.

Gentlemen:

We beg to report that we have examined the books and vouchers of the American Medical Association for the year ending December 31, 1908, and we hand you herewith the following statements:

Comparative Balance Sheet as at Dec. 31, 1907 and 1908.
Revenue Account for the year ending Dec. 31, 1908.
Disposition of Revenue for the year ending Dec. 31, 1908.
Summary of Investment in Second Edition of Directory as at Dec. 31, 1908.

Summary of Inventories as at Dec. 31, 1908.
Details of Bond Account as at Dec. 31, 1908.
Summary of Publication Expenses for the year ending Dec. 31, 1908.

Summary of Organization Expenses for the year ending Dec. 31, 1908.

Summary of Association Expenses for the year ending Dec. 31, 1908.

Summary of Medical Legislation Expenses for the year ending Dec. 31, 1908.

Summary of Medical Education Expenses for the year ending Dec. 31, 1908.

Summary of Pharmacy and Chemistry Expenses for the year ending Dec. 31, 1908.

Summary of Medical Research Expenses for the year ending Dec. 31, 1908.

Summary of Depreciation for the year ending Dec. 31, 1908.

As in former years the book values of Buildings, Furniture and Fixtures, etc., have been reduced by charges against Income to provide for Depreciation.

On the other hand we would call your attention to the fact that there has been charged during the year under review to Buildings Account an amount of \$4,325.20. This represented largely the cost of altering an old residence adjoining the main building of the Association to enable it to be used in connection with the latter for business purposes. It is probable that an arrangement of this kind will not be permanent so that the amount whereby the actual value of the buildings has been increased by these expenditures is questionable.

We would call your attention to the item carried among the Assets on the Balance Sheet representing the expenditures to date on the second edition of the Directory. Inasmuch as the Directory has not yet been issued, it is technically proper to carry this amount as an Asset, but in view of past experience it seems quite probable that a portion of it will eventually be charged off Profit and Loss Account.

We would call your attention to the following items included in the statements attached:

In the Balance Sheet is shown among the Assets "Net Investment in Second Edition of Directory \$14,801.87," which represents the total expenditures to the close of the year for labor, material, etc. used in preparing the second edition not yet distributed. Details of this account are shown in "Schedule A" attached hereto.

We believe that the other items included in the statements do not need any special comment.

In the course of our audit we examined vouchers for all cash disbursements with the exceptions of a few made during the latter part of the year, vouchers for which had not been returned by the bank at the time of our visit. These we will take up later and report upon if it appears necessary.

In checking the vouchers for disbursements we took care to examine invoices or other evidence that the items covered by them

represented proper liabilities of the Association, and that there had been proper authority for the payments of the same by the Officers.

We verified the cash in bank by means of statements furnished by the bankers and that on hand by actual count. We verified the securities by means of certificates furnished by the bankers in whose care they were deposited.

In the course of the audit we made tests of the lists of subscribers, which tests resulted in no inaccuracies being discovered. We also did certain other work which appeared advisable for the protection of the Association.

We are of the opinion that the bookkeeping and office work are handled in a very efficient manner and that every attempt is being made to conserve the interests of the Association by the employees connected with the Accounting Department.

We would be pleased to furnish you with any further information in our possession that you may require regarding these accounts.

Yours faithfully,

THE INVESTORS AUDIT COMPANY,

Manager.

COMPARATIVE BALANCE SHEET AS AT DECEMBER 31, 1907 AND 1908

ASSETS			
Dec. 31, 1907			Dec. 31, 1908

DR. ARTHUR T. McCORMACK, Kentucky: I move that when the House of Delegates adjourns, that it adjourn in honor to the memory of Dr. T. J. Happel, a former member of this body and of the Board of Trustees.

This motion was seconded by several and carried.

THE FIRST VICE-PRESIDENT: We will now listen to reports of the standing committees.

Report of Judicial Council

To the Chairman and Members of the House of Delegates:

The Judicial Council would respectfully report that there has been nothing come before it on appeal from county societies nor state associations. The Chairman has received a few letters of inquiry and requests for interpretations of the principles of ethics, which have easily been disposed of by sending marked copies of the Principles of Ethics, together with instructions to make inquiry of their state associations and county societies for any local additions to these principles.

Respectfully submitted,

C. E. CANTRELL, Chairman.

DR. ARTHUR T. McCORMACK, Kentucky: I move that the Chairman appoint a committee of three on Triennial Reapportionment.

Seconded and carried.

THE FIRST VICE-PRESIDENT: I will announce this committee later.

Report of the Committee on Medical Legislation

The report of the Committee on Medical Legislation was read by Dr. Charles S. Bacon, Illinois, in the temporary absence of the Chairman, Dr. Charles A. L. Reed, as follows:

To the Members of the House of Delegates of the American Medical Association:

Your Committee on Medical Legislation begs leave, herewith, to submit its annual report, and, as a part of the same, the accompanying *Bulletin* comprising the record of the "Annual Conference of the Committee on Medical Legislation and the National Legislative Council," held at Washington, D. C., Jan. 18, 19 and 20, 1909.

An examination of this *Bulletin* will show that your committee has had under consideration during the past year (a) the Navy Medical Reorganization Bill; (b) bills relating to the Public Health and Marine-Hospital Service; (c) measures relating to the Federal and State Regulation of the Public Health; (d) relief measures for the surviving families of persons who have died in the medical service of the country; (e) the uniform regulation of the practice of medicine by the different states; (f) uniform regulation of vital statistics by the states; (g) uniform state laws on foods and drugs; (h) the attitude of the last administration in appointing a commission for the purpose of reviewing and thus overriding certain findings of the governmental agencies lawfully established for the interpretation and enforcement of the National Pure Food and Drugs Act, and (i) the general question of expert medical testimony.

Although these several questions are considered at length, and although the conclusions reached by the Conference are fully set forth in the *Bulletin* submitted herewith, it seems important that further, but brief, allusion should be made to certain of the subjects therein mentioned, and particularly, that certain information that naturally does not occur in the formal record should be placed before the House of Delegates.

THE HEARING OF THE PUBLIC HEALTH BILL

On January 19, your committee, accompanied by the attending members of the National Legislative Council, appeared before the subcommittee of the House Committee on

Interstate and Foreign Commerce, and were accorded a full hearing on the pending measure to protect the public health and to impose additional duties on the Public Health and Marine-Hospital Service. This bill, known as Senate Bill 6102, had passed the Senate, had been reported out of committee in the House and was then on the open calendar. It had been agreed, however, between the Surgeon-General of the Public Health and Marine-Hospital Service and the representatives of the Committee of One Hundred, that an amendment to the bill should be offered either on the floor or by having the bill referred back to the committee, which amendment should embody a provision for the transfer of certain existing bureaus and services with the object more especially of creating a new national public health bureau.

A NATIONAL BUREAU OF PUBLIC HEALTH

The amendment was based on the recommendations contained in the message of President Roosevelt and had been drawn in conference with him and the representatives of the Committee of One Hundred. It consisted, in effect, of a provision authorizing the President at his discretion and by executive order, to transfer any existing bureau or service from any department in which it now exists to any other department of the government and similarly to reassemble and reorganize the bureaus thus transferred. The Conference endorsed the amendment to the extent of approving the proposition to transfer and reassemble "into a single department the various existing national public health agencies." The Conference further proposed an amendment to the bill to invest the Public Health and Marine-Hospital Service with power to regulate the sanitation of interstate streams. It was these two amendments that the subcommittee, through the intervention of Hon. A. J. Barchfeld, M.D., member of Congress from the thirty-first Pennsylvania District, consented to hear in anticipation of their actual presentation. Your committee urged the importance of the effect aimed at by both propositions. The fact that the bureau of health amendment contemplated the creation of such a bureau by means at variance with the previously expressed policy of the American Medical Association, was waived in view of the fact that the amendment in question had been based on the message of President Roosevelt; that it had been submitted by the representatives of the Committee of One Hundred only after consultation with him, and in view of the additional fact that the American Medical Association stood precommitted to cooperate with the Committee of One Hundred on any proposal that it might bring forward relative to this particular question.

It became apparent, however, in the course of this hearing and other interviews (1) that there was some sentiment in Congress favorable to the creation of a Department of Public Health with representation in the cabinet, and that looked on this measure as obstructive; (2) that the proposed amendment was looked on as being so framed that the present organization of any and all departments could be changed at the discretion of the President, and that changes outside of the health services were believed to be the real object of the measure which, in this particular, was looked on as being disingenuous; (3) that there was a decided objection, pointedly expressed by the members of both branches of the Congress, that the proposition contemplated the surrender by the Congress of a constitutional prerogative, and was an additional instance of the attempted encroachment of the executive on the legislative branch of the government; and (4) that the creation of a governmental bureau by executive order was without precedent, and that such a precedent ought not to be established. In view of these considerations it is not surprising that the measure did not come up for passage, and consequently that no occasion arose by which the amendment could be offered from the floor. Your committee is now authorized to state that its effort to secure the establishment of a more highly organized national public health service by practicable and constitutional legislation will receive the cordial support of President Taft.

THE PUBLIC HEALTH AND MARINE-HOSPITAL SERVICE

The bill to which allusion has just been made and another bill (Senate 6101), known as the "Personnel Bill," naturally died with the Congress before which they were pending. They are both meritorious measures, and with some slight amendments of the original bills ought to be enacted into law. At the time of the preparation of this report they had not been resubmitted to the Congress, as your committee is advised by the Surgeon-General of the Public Health and Marine-Hospital Service that the Secretary of the Treasury under

the present administration has had as yet no opportunity to go over the measures. The present organization of our government makes it impossible for any move to be made by the administration in public health matters until they shall have been considered and passed on by the layman who happens to be at the head of the Treasury Department. This fact makes it very pertinent to enquire whether or not there would be a practical advantage in having, if not a physician, at least some man with a technical knowledge of public health problems, as the particular Assistant Secretary of the Treasury to whom the Surgeon-General of the Public Health and Marine-Hospital Service reports, and who, in the nature of things, must be the adviser of our National Officer of Health, otherwise known as the Secretary of the Treasury.

THE NAVAL MEDICAL REORGANIZATION BILL

Senate bill S. 1017 and House bill H. R. 6184, "To Reorganize and Increase the Efficiency of the Hospital Corps of the United States Navy and Regulate Its Pay," has been repeatedly introduced, and passed the House last session: it is now before both the House and Senate, and should pass the regular session of this Congress on its merits. This bill provides for the reorganization of the Hospital Corps, together with the creation of the grade of chief pharmacist. The creation of this additional grade represents the only additional expense. Pharmacists now represent the only warrant officers to whom the benefits of this advanced grade are not extended, the naval appropriation bill, approved March 3, 1909, having provided for the promotion of machinists to chief machinists. It is with a view to correct this unfair discrimination that the present bill has been introduced.

THE NAVAL DENTAL SERVICE

Senate Bill S. 1015 and House Bill H. R. 6741, "Authorizing the Appointment of Dental Surgeons in the Navy," deserves a special word of consideration.

For many years the Navy Department has consistently recommended legislation providing for the services of dentists in the Navy. The arguments in favor of authorizing the employment of skilled dentists in the Navy may be found clearly and exhaustively set forth in the various annual reports of this Bureau and also may be found ably epitomized and compiled in Report No. 1227, accompanying the dental bill when, on March 13, 1908, it was committed to the Committee of the Whole House. Bills looking to the appointment of dental surgeons, which have the approval of this Bureau, have been introduced both in the Senate and House at the present session of Congress and have taken their place on the calendars and will, it is hoped, duly come up for consideration at the regular session.

Dental surgeons are needed in the Navy quite as much as, if not more than, in the Army, which service enjoys free treatment by dentists employed in accordance with law, and it seems an unjust discrimination against the enlisted men of the Navy not to provide for similar dental work, especially in view of the universally recognized economic importance of sound teeth in military service.

A MEDICAL RESERVE CORPS FOR THE UNITED STATES NAVY

The Navy Department, during the last session of Congress, approved the insertion of a clause in the Navy appropriation act for that year under "Pay of the Navy," providing for the establishment of a reserve corps for the medical department of the Navy, and recommended the insertion of this clause to Congress, but it failed of favorable consideration.

The clause as recommended is based on the act approved April 23, 1908, which established a Medical Reserve Corps for the Army, and by this clause the Bureau seeks exactly similar provisions for the Navy.

A Medical Reserve Corps in the Navy is urgently required to place the medical department on a sound footing in respect to medical assistance available should any occasion arise for emergency expansion.

If this measure is enacted and the desired corps is established.

1. The Medical Department of the Navy will be placed in close contact with the members of the medical profession throughout the country, and will be in a position to call them into consultation and enjoy the advantage of their advice should the occasion require.

2. It would secure for the medical department adequate and efficient assistance, no matter what or how great the emergency demand.

3. It would make the services (Army and Navy) equally attractive. This equality does not exist under the present

policy of requiring all candidates for the Navy Medical Corps to pass through a probationary period as acting assistant surgeons under instruction at the Naval Medical School before being eligible for commissions in the regular service.

The proposed amendment is as follows:

Provided, That a medical reserve corps, to be a constituent part of the medical department of the Navy, is hereby established under the same provisions, in all respects (except as may be necessary to adapt the said provisions to the Navy), as those providing a medical reserve corps for the Army and as set forth in the act to increase the efficiency of the medical department of the United States Army, approved April 23, 1908.

HOSPITAL SHIPS FOR THE NAVY

As permanent adjuncts of the Atlantic and Pacific fleets, such ships have become a necessity and their value, both from economic and humane considerations, has been fully demonstrated by the experience of the hospital ship *Relief*, which was recently with the Atlantic fleet on its cruise. This ship, although a makeshift and scarcely seaworthy, on many occasions during the cruise saved to the fleet the services of men-of-war, which, in former times, were required to be diverted on the occurrence of infectious disease, etc., from their legitimate functions to serve as carriers for the sick or injured.

The Bureau has urged the Department to make provisions in the estimates presented to Congress for two hospital ships based on plans already prepared under the Department's direction, the cost of each not to exceed \$1,500,000.

The unseaworthiness of the hospital ship *Relief* has required that she be retained in Philippine waters, and her services are, therefore, restricted and not available for service with the fleet.

The Department has authorized the refitting of the U. S. S. *Solace* as a hospital ship, and this work is now approaching completion. It must be understood, however, that ships of this nature represent only makeshifts and are not of a type suitable for this purpose.

The amendment as proposed is as follows:

Increase of the Navy; Hospital Ships. The Secretary of the Navy, in his discretion, is hereby authorized to purchase and fit two ships of American registry, having a gross tonnage of not less than eight thousand tons each, to be used as hospital ships;

Provided, That the cost of the two ships shall not exceed three million dollars;

And provided further, That one or both of said ships, in the discretion of the Secretary of the Navy, may be built by contract.

ISTHMIAN SANITATION

The sanitation of the Canal Zone is being maintained at such a high standard, the results achieved are so thoroughly satisfactory, and the status given to the sanitary department under the present administration is so high and influential that no additional legislation relating thereto has been required from Congress.

The fact that the chief sanitary officer is now a member of the commission, and that he now has coordinate rather than subordinate powers, is largely responsible for the fact that the work of constructing the canal with a minimum loss of human efficiency from disease and death, is progressing with a rapidity never before known in the history of such enterprises.

It is, furthermore, a source of satisfaction to report, on authority, that President Taft is already giving careful attention to the future sanitation of the Isthmian Lake, now in course of construction. This body of water will be several hundred square miles in extent and would be an ideal breeding place for the anopheles mosquitoes, the unrestricted multiplication of which would be a serious menace to the health of the Isthmus.

Any apprehension that may arise from these circumstances may be allayed in view of the fact that the problem, which is still several years away, is already in process of solution by President Taft, in cooperation with the distinguished gentleman who presides over our deliberations to-day, Col. William C. Gorgas.

WORK IN THE STATES

During the past winter the legislature has been in session in forty states as follows: Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, New Hampshire, New Mexico, New York, Nevada, New Jersey, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Vermont, Utah, Washington, West Virginia, Wisconsin and Wyoming. In

each of these states the member of the Council on Medical Legislation was asked to designate a member living at the capital city to act as capital correspondent and to keep the Bureau informed regarding the progress of legislation in the state. The only measure actively taken up by the committee was the bill regulating the registration of vital statistics, which was endorsed by the House of Delegates at the Chicago Session, and which, after discussion of its provisions by the Section on Hygiene and Sanitary Science as well as the American Public Health Association, was further amended and a final draft printed, a copy of which is attached herewith. At the request of the Bureau of the Census, special efforts were made to secure the passage of this bill in Illinois and Missouri. Owing to unfortunate and unavoidable political conditions, the passage of the bill in Illinois was impossible. We are glad to report, however, that owing to the energetic efforts of the Committee on Medical Legislation of the Missouri State Medical Association, the model bill was passed by both houses of the legislature and became a law. In addition to this, the bill in a modified form was adopted by the Arizona legislature and the Delaware vital statistics law was so modified as to admit that state to the registration area. It is the intention of your committee to continue its efforts along this line in selected states each year, until the model bill has been adopted in all of the states.

In addition to the special efforts made in Missouri and Illinois, the model bill on vital statistics was also distributed widely in the various non-registration states, not with any expectation of securing its passage this year, but in the hope of laying the foundation for future activity. It was introduced in Tennessee and Kansas, but was not passed. It will undoubtedly be presented in these states at the next session of the legislature. This matter is now in definite form, and it is only necessary to continue systematic efforts to solve this problem permanently.

OTHER STATE LEGISLATION

In addition to the special work done along the line of vital statistics legislation, your committee has endeavored to cooperate, wherever possible, with the committees of the various state associations for the furtherance of desirable legislation and for the defeat of vicious and undesirable bills. As a motion was unanimously adopted at the Washington Conference in December not to take part in any state campaign unless specifically requested to do so by the committee on legislation of the state association, your committee has restricted its efforts to those cases in which it was specifically asked to assist the state committees in their work. As usual, the principal battles have been waged around the question of medical licensure and the recognition of the right to practice. Perhaps the most important effort at constructive legislation was that undertaken in Pennsylvania, in which the so-called Herbst-Shreve bill, introduced into both houses on the endorsement of the state committee on legislation, aroused marked interest not only in the profession, but in the public mind and daily press as well. Owing to the number of amendments introduced and attached to the bill in its progress through the legislature, it finally became unsatisfactory to its friends and was withdrawn, leaving Pennsylvania with the cumbersome and ineffective medical practice act of previous years. Efforts will probably be made at the next session of the legislature to secure the passage of a satisfactory practice act.

Efforts have been made in a number of states to secure the enactment of osteopathic and optometry laws, as well as a class of bills recognizing various "schools" previously unheard of. A brief summary of the legislation in the various states follows:

ARIZONA

Model vital statistics act passed, with amendments. Arizona Medical Association made an effort to secure the passage of a bill providing for a bacteriologic and chemical laboratory in connection with the University of Arizona.

ARKANSAS

Bill creating a separate board of examiners for physio-medics defeated in the senate.

CALIFORNIA

Bill establishing a board of examiners for "naturopaths" defeated.

COLORADO

Bill establishing a state board of osteopathy defeated, also bill amending the Colorado medical practice act. Bill establishing state board of osteopathic examiners defeated by the

introduction of a bill placing the examination and licensing of opticians in the hands of the state board of medical examiners. Bill providing for the licensing of all hospitals, dispensaries and institutions for the treatment of sick by the state board of health became a law.

CONNECTICUT

Antivaccination bills were defeated. It is hoped that an optometry bill will also fail to pass.

DELAWARE

Amendments to the existing vital statistics act were passed, bringing Delaware into the registration area.

FLORIDA

Bill providing for a state board of osteopathic examiners introduced. No word yet received regarding the outcome of this bill.

ILLINOIS

The usual osteopathic and optometry bills which have been introduced throughout the last four sessions of the legislature appeared again and were defeated. A most excellent bill reorganizing the state charitable, eleemosynary and corrective institutions and placing them all in the hands of a state board of administration, was introduced, but failed to become a law. A bill authorizing municipalities to establish and maintain public tuberculosis sanatoria became a law. The vital statistics bill failed to pass.

INDIANA

The following legislation was enacted: 1. Anti-stream pollution act to prevent the introduction of impurities into the public streams of the state and conferring on the state board of health certain powers to enforce its provisions for the protection of the public health. 2. Housing bill, regulating the construction and maintenance of tenements, lodging and apartment houses. This applies only to Indianapolis and Evansville. 3. Amendment to the state health law, defining the powers and duties of the state board of health, etc., and giving all boards of health "power to do what is reasonable and necessary for the prevention and suppression of disease and the protection of the public health." 4. Act regulating bakeries, canneries, packing houses, slaughter houses and all establishments in which food of any kind is stored or produced, also regulating the method of preparation of food products, etc. 5. A law regulating the management of county jails and providing for their sanitary conduct. 6. An act requiring steam railroads to equip trains with medical supplies. 7. An act authorizing the trustees of the Indiana State University to conduct a medical school. 8. An act protecting natural, mineral and medicinal springs of the state and preventing waste, pollution, etc. 9. An act appropriating \$135,000 for a state tuberculosis hospital. 10. An act providing for medical inspection of school children. 11. An act providing for the establishment of a hospital for insane criminals. The usual appropriation bills were also passed with an increase of the amount appropriated for the use of the state board of health. Public health matters in Indiana are in a most excellent condition and the cooperation existing between the state board of health, the state medical association and the various committees on medical legislation is intimate and satisfactory.

IOWA

The optometry bill was defeated in the lower house. The most satisfactory bill passed by the state legislature was the county hospital bill providing for the establishment and maintenance of county hospitals in any county in the state. A bill of special significance was one providing for the consolidation of all the boards of the state, including pharmacy, health, food and drug, medicine, chemistry, veterinary surgery, etc., into a single board to have entire charge of all health matters. This bill, while it did not become a law, is of special interest as representing the inevitable reaction from the multiple boards that have markedly increased in the past years.

KANSAS

Probably the most important legislation was the appropriation of \$10,000 a year for two years for the use of the state board of health in inaugurating a state wide educational campaign for the suppression and prevention of tuberculosis. Other laws looking toward the suppression of tuberculosis were also enacted. The food and drugs act was amended and various sanitary laws adopted. The vital statistics bill failed to pass on account of the appropriation feature. It will doubtless be reintroduced and passed at a later session.

MASSACHUSETTS

Of two bills in opposition to vivisection, one was killed and another is pigeonholed and doubtless is dead. The optometry bill was killed. The osteopathic bill was defeated in the Committee on Public Health, but has been amended several times and has gone through both houses. It has not yet reached the governor. The bill consolidating the boards of registration in medicine, dentistry and veterinary medicine was defeated. Several other bills of less notoriety were defeated, for instance, two bills looking to the prevention of dispensing medicine by the physician! Two bills relating to the registration of nurses are still under consideration.

MICHIGAN

Bills were enacted providing for an optometry board as well as for a board of examination for trained nurses, consisting of the secretary of the state board of health, one member of the state board of registration in medicine and three nurses to be appointed by the governor. A tuberculosis bill requiring all physicians to report cases of tuberculosis within twenty-four hours and also providing for the disinfection of all premises in which tuberculosis patients have died also became a law.

MINNESOTA

The most important bill enacted was one prohibiting advertising in any form containing suggestive or immoral terms. This bill was bitterly fought by the interests affected, but was finally adopted. A bill regulating the sanitary condition of workshops and factories was also passed. A bill providing a board of examiners for "naturopaths" was defeated.

MISSOURI

In addition to passing the model vital statistics bill admitting Missouri into the registration area, the medical practice act was also amended, increasing the power of the state board, giving it the right to subpoena witnesses and compel attendance and also giving it jurisdiction over physicians licensed under and previous to the act.

NEBRASKA

A law was enacted providing for the care of indigent consumptives and providing that persons declared by the courts to be invalids should be entitled to public care. A bill creating a board of osteopathic examiners, as well as one providing for the registration of trained nurses under the supervision of the state board of health, became laws.

NEW JERSEY

An amendment to the medical practice act was adopted giving the osteopaths one member on the state medical examining board and legal status as practitioners.

NEW YORK

The antivivisection bills were killed in the committee on judiciary. The bill regulating medical expert testimony was not adopted.

NORTH CAROLINA

An optometry bill similar to those introduced in other states became a law.

NORTH DAKOTA

An osteopathy bill, creating a separate board of osteopathic examiners, became a law.

OHIO

The optometry bill was defeated. Other legislation was not undertaken on account of the session of the legislature being a special one.

PENNSYLVANIA

The antivivisection bill failed to pass. An osteopathic bill, creating a board of five members, passed both houses and was signed by the governor. A milk adulteration bill, as well as a bill establishing a board of examiners for trained nurses, was enacted. A food bill known as the Todd-Murphy bill, permitting the use of benzoate of soda and sulphur dioxide as preservatives, was also passed. The Herbst-Shreve bill, providing a new medical practice act, was withdrawn.

RHODE ISLAND

A bill providing for a board of optometry examiners became a law.

TENNESSEE

Bills comprising a new medical practice act, as well as the model vital statistics bill, have been introduced into the legislature. No final action has as yet been reported.

VERMONT

The optometry bill was adopted; also a bill amending the medical practice act, various sanitary measures, such as acts providing for the free distribution of antitoxin, amending the pure food and drug law and prohibiting the pollution of public waters, etc.

WISCONSIN

An antivivisection bill referred to the committee on public health was indefinitely postponed.

WYOMING

Efforts were made to amend the medical practice act, but were not successful.

WORK OF THE BUREAU

In addition to cooperating with the various state committees and assisting so far as possible in the legislative campaign in the various states, as outlined above, the Bureau has endeavored to carry on constructive work in the direction of uniform state legislation. The work done on a model bill for vital statistics was outlined in the report of last year. We now have a model bill suitable for enactment by any state (with slight modifications and changes), and endorsed by all the health bodies interested in this work. The continued efforts of the committee and of the Bureau will be directed in the future to securing the adoption of this bill in all non-registration states.

Similar efforts have been made in the direction of uniform food and drug legislation. In August of 1908 the secretary entered into correspondence with Mr. R. M. Allen of the Department of Justice, Washington, D. C., secretary of the Association of National and State Food and Dairy Departments, with a view to securing cooperation between his organization and the American Medical Association along this line. At the annual Conference on Medical Legislation, held at Washington in January of 1909, Mr. Allen and Dr. Bigelow, of the Department of Agriculture, addressed the Conference, submitting a model bill which had been drawn up by the Committee on Uniform State Legislation appointed by the Association of National and State Food and Dairy Departments. This bill, containing an elaborate system of standards and definitions necessary for successful pure food legislation, was endorsed by the Conference and has been printed by the Bureau and distributed widely. A copy is submitted herewith. The secretary is now endeavoring to secure cooperation with the National Wholesale Grocers' Association as well as with the state and national pharmaceutical associations. A section on drugs will later on be drafted and added to the bill and the endorsement of all organizations interested in pure food and drug legislation secured. We will then be in a position to advocate the adoption of uniform legislation on this important subject. The proposed bill was drafted by Mr. R. M. Allen, assistant to the attorney-general of the United States, who also drafted the Kentucky pure food law. He is probably one of the best authorities on the legal aspects of food and drug legislation in the country and is earnestly cooperating with the committee in the furtherance of its work.

The most difficult and intricate question now before the committee is that of the preparation of a uniform bill for the regulation of the practice of medicine. It is impossible to go into this question at length within the limits of this report. The secretary has been endeavoring so far as time permitted during the last two years, to accumulate material for the careful study of this most important question. In the *Bulletin* for Nov. 15, 1907, appeared a synopsis of the existing medical practice acts of the various states, and in the report of the secretary, made at the Washington conference, a synopsis of the history of medical legislation in the United States. The secretary now has on hand a large amount of material, consisting of a complete file of existing medical practice acts, together with many previous acts, a considerable amount of historical matter throwing light on the subject as well as a large number of supreme court decisions in the various states bearing on the question of medical licensure, the power of the state, the powers and duties of examining boards, the definition of the practice of medicine and many other points of vital importance in considering this question. All of this matter, it is hoped, can be published in the *Bulletin* early in the fall. The time now seems ripe for a general discussion and careful consideration of the entire subject of state legislation regulating the practice of medicine. Your committee therefore recommends that it be authorized to call a general conference, to take the place of its annual Conference on Medical Legislation and to be devoted to a discussion of the essentials of a uniform medical practice act for adoption by the various states. To such a conference should be invited all members

of the National Council, all members and especially presidents and secretaries of state examining boards, all members of state committees on medical legislation, representatives of various colleges, etc., and particularly representatives of the sectarian schools of medicine as well as prominent jurists, sociologists and economists. The regulation of the practice of medicine has too long been considered a question which concerned the medical profession alone and which each state must solve alone and unaided. We should not only accept but should earnestly seek for all the assistance which can be secured from those who can enlighten us along legal, sociologic and economic lines.

We should also endeavor to secure uniformity in essentials, so that the present chaotic, shifting and uncertain situation may be remedied.

The committee, and especially the secretary, desire to acknowledge the great assistance afforded by the officers of the various state and county societies, chairmen and members of the committees on medical legislation and the members of the association who have assisted us in securing desired information along legislative lines. Through the continued assistance of all physicians interested in medical legislation we hope to make the Bureau and committee of much greater service during the coming year than it has been in the past.

The work of the Bureau has been under the supervision of Dr. Frederick R. Green, whose services can not be too highly appreciated.

Respectfully submitted,

CHARLES A. L. REED, Chairman.
CHARLES S. BACON.
GEORGE W. GAY.

FREDERICK R. GREEN, Secretary.

The report was referred to the Reference Committee on Legislation and Political Action.

Report of the Council on Medical Education, For the Year Ending June 1, 1909

The report of the Committee on Medical Education was presented by the chairman, Dr. Arthur Dean Bevan, Illinois, as follows:

To the Members of the House of Delegates of the American Medical Association:

For five years the Council on Medical Education has been working for higher and more uniform standards of medical education. In this time many changes for the better have been brought about. Such influence as the Council may have had toward these improvements has been due largely to the following facts:

1. The Council is the committee on education of the medical profession of America, represented by the American Medical Association. As such, its interests are national and its object is the betterment of medical education in all sections of the country.

2. It is a permanent committee, thereby exerting a constant, steady influence for improvement, not possible through temporary committees, however excellent their work might be.

3. Its headquarters at the home of the medical profession of America and its connection with the *Journal of the American Medical Association*, with its extensive body of correspondents, made it possible to obtain much information which otherwise could not have been secured.

4. An abundance of information has been collected, tabulated and published regarding medical colleges, standards, students, graduates, facilities and equipment, as well as much information regarding the requirements for license to practice medicine both in this country and abroad. Information has also been collected regarding elementary, secondary and collegiate education.

5. This information, formerly not available, has thrown much light on medical education, revealing quite clearly problems which otherwise could not have been seen.

6. As problems have arisen they have been presented at annual conferences on medical education for discussion. These annual conferences have been held under the auspices of the Council on Medical Education and to them are invited as delegates those who are interested and whose advice and influence may be helpful in elevating the standards of medical education; from the state licensing boards, state medical societies, confederation of examining boards, college associations and the United States services, as well as from colleges of liberal arts and other interested organizations. They have been attended by an increasing number of delegates each year. They are entirely informal and are devoted to the discussion of the more urgent problems of medical education, the reports of

which have been given wide circulation in the columns of the *Journal of the American Medical Association* and by reprints. These conferences have undoubtedly been a strong influence favoring higher and more uniform standards.

It might be well to briefly review the work of the five annual conferences. The first conference was held in Chicago, April 20, 1905. At this conference the questions of preliminary education, medical curriculum and the relation of the college of liberal arts to the medical school were discussed, as a result of which the Council formulated the following as the minimum standard of the American Medical Association:

MINIMUM STANDARD

(a) A preliminary education sufficient to enable the student to enter the freshman class of our recognized universities, (b) the passing on the credentials of such an education by a state official, (c) the graduation from an approved medical college requiring a four years' course of not less than 30 weeks each year with 30 hours each week, of actual work, (d) the passing of an examination for licensure before a state board.

IDEAL STANDARD

The Council further formulated a so-called ideal standard which should be secured as rapidly as the conditions throughout the country warranted. This ideal standard was briefly as follows:

(a) A four year high school education, (b) a year's university training in physics, chemistry and biology, (c) four years of medicine proper, and (d) one year as interne in a hospital or dispensary.

THE SECOND CONFERENCE

At the second conference, held in Chicago, May 12, 1906, probably the most important facts presented were the standings of the various medical colleges based on the failures of their graduates in examinations before state boards. The colleges were divided into three groups: those having less than 10 per cent. of failures; those having from 10 to 20 per cent., and those having above 20 per cent. A fourth unclassified list was made of those colleges which had insufficient data to permit of comparison. These reports, which are published annually in the State Board statistics prepared by the Council, have been productive of much good in stimulating faculties to guard against the graduation of illy prepared students.

THE THIRD CONFERENCE

At the third conference, held in Chicago, April 29, 1907, a detailed report of a personal inspection made by members of the Council of all the medical schools of the United States was presented. In this inspection the schools were marked on a civil service basis consisting of ten points covering the essentials of a modern medical college, these 10 points making a possible 100. And on this basis the colleges as graded were divided into three groups. The result was as follows: An acceptable group of 82 colleges with marks from 70 to 100, a conditioned group of 46 colleges with marks from 50 to 70, and a rejected group of 32 colleges with marks below 50.

This personal inspection of colleges has been continued and a second inspection will soon be completed.

THE FOURTH CONFERENCE

The fourth annual conference held in Chicago, April, 1908, was from many standpoints most encouraging and interesting. The secretary presented a graphic study of medical education in the various states of the union and in the twenty most important countries of the world showing the comparative position of medical education in this country with that of the rest of the world.

It was revealed that while this country had a few medical colleges equal to any in the world, it was nevertheless far behind other nations in standards of both preliminary and medical education. More encouraging was the report of a campaign carried on during the year by the Council to secure the adoption by medical colleges of higher preliminary standards. This report brought out the fact that more than fifty first-class schools in this country had agreed to accept what has been adopted by all the rest of the world, i. e., a five year medical course. This is to be brought about by adding to our present preliminary requirements of a four year high school course, at least one year of physics, chemistry and biology.

This advance requirement has become so general that it will doubtless be adopted by all first-class schools within the next few years and thus place American medical education on a par with that of England, France, Germany, Austria, Canada—in fact, with that of all our neighbors and rivals in progress and civilization.

THE FIFTH CONFERENCE

At the fifth annual conference, held in Chicago, April 5, 1909, the chief feature was the report of a committee on medical curriculum. This committee consisted of one hundred prominent educators representing all the departments and specialties in medicine. It has done a splendid piece of work, which we feel is most important and timely since we are just entering on what we believe will prove to be the greatest re-constructive period in the history of medical education in America. The recommendations of this committee on what constitutes a proper medical course are most interesting and have already attracted much attention.

A 4,100 hour curriculum was agreed to, divided among the various departments as follows:

SUBJECT	HOURS
I. Anatomy, including histology and embryology.....	700
II. Physiology and Physiologic Chemistry, including 80 hours of Organic Chemistry.....	530
III. Pathology and Bacteriology.....	500
IV. Pharmacology, Toxicology and Therapeutics.....	240
V. Medicine, including Pediatrics and Nervous Diseases....	800
VI. Surgery: General and Special.....	650
VII. Obstetrics and Gynecology.....	240
VIII. Diseases of the Eye, Ear, Nose and Throat.....	140
IX. Dermatology and Syphilis.....	90
X. Hygiene, Medical Economics and Medical Jurisprudence	120
Total	4,100

It was the unanimous opinion of the committee that a hard and fast medical curriculum uniform for all colleges was not desirable and not for the best interests of medical education. It was definitely stated, therefore, that the curriculum recommended by this committee was to be regarded as suggestive and educational only, and was not intended for adoption as an absolute and fixed requirement either by medical colleges or by state boards. The curriculum reported does not represent a minimum requirement but one which is sufficiently comprehensive to meet the present demand of medical education.

A second and no less important subject discussed at this conference was the desirability and value of practical state license examinations as the best means of testing the candidate's ability to practice medicine. Statements were made by state board members present suggesting that in addition to the written examination the candidate be required to do some chemical laboratory work, to examine specimens under the microscope, to describe gross pathological and anatomical specimens, to make demonstrations on the obstetric manikin and on the cadaver or to make application of bandages or surgical dressings. Several states have already introduced such practical examinations and others are contemplating doing so. Although there are some difficulties to be overcome, the advantages of these methods are obvious. As is well known, such tests have long been employed in practically all European countries. The members of the Council are unanimous in endorsing this as one of the most important advances to be made. On the whole, much has been accomplished, which will be briefly outlined in the following report, showing the present status of preliminary and medical education in the United States:

PRELIMINARY EDUCATION

Investigation reveals much confusion in standards not only among medical schools, but also in high schools, colleges and all other departments of education. No previous time, however, has seen so many forces at work in the effort to standardize the different departments and to develop system and uniformity.

High Schools.—Many of the states are seriously lacking in good high schools, which observation applies as much to a number of states north of the Mason and Dixon line as to those south of it. In fact, there are very few states which have all their high schools well organized, well equipped and supplied with well qualified, college-trained teachers. This department of education is now being systematically taken up by various organizations, including the General Education Board, and throughout the southern states a high-school inspector with the title of a "Professor of Secondary Education" has been placed with each state university. Public sentiment throughout the south is rapidly being awakened and already vast sums have been appropriated by legislatures to develop high schools. Leading educators in the south state that within four to five years that section will be fairly well provided with four-year high schools.

Colleges and Universities.—Several educational organizations, including the Associations of Universities and the Carnegie Foundation for the Advancement of Teaching, are now at work in an effort to standardize colleges and universities,

many of which, from an educational standpoint, have no right to such titles, since they give courses of little more, or even of less value, than those in some of the better high schools.

PRELIMINARY REQUIREMENTS OF MEDICAL SCHOOLS

Eleven medical colleges already require two or more years of work in a college of liberal arts for admission. These colleges and the years when such requirement began are as follows:

College	Began
Johns Hopkins University Medical Department.....	1893
Harvard Medical School.....	1900
Western Reserve University, Medical Department.....	1901
University of Chicago, Rush Medical College.....	1904
University of California, Medical Department.....	1905
University of Minnesota, Coll. of Med. and Surg.....	1907
University of Minnesota, Homeopathic Department.....	1907
University of North Dakota, College of Medicine.....	1907
University of Wisconsin, College of Medicine.....	1907
Cornell University Medical College.....	1908
Wake Forest College, School of Medicine.....	1908

Eighteen other colleges have definitely announced an increase in their entrance requirements to two or more years in a college of liberal arts. These and the dates when such requirements will become effective are as follows:

College	Begins
Leland Stanford Junior University, Department of Medicine.....	1909
Yale Medical School.....	1909
*Northwestern University Medical School.....	1909
University of Kansas, School of Medicine.....	1909
University of Michigan, College of Medicine.....	1909
*University of Nebraska, College of Medicine.....	1909
University of South Dakota, College of Medicine.....	1909
University of Colorado, School of Medicine.....	1910
†Indiana University School of Medicine.....	1910
†State University of Iowa, College of Medicine.....	1910
Drake University, College of Medicine.....	1910
†University of Missouri, Department of Medicine.....	1910
John A. Creighton Medical College.....	1910
Dartmouth Medical School.....	1910
Columbia University, College of Physicians and Surgeons.....	1910
†Syracuse University, College of Medicine.....	1910
†University of Pennsylvania, Medical Department.....	1910
†University of Utah, Medical Department.....	1910
* One year required for the session of 1908-09.	
† Will require one year for the session of 1909-10.	
‡ One year has been required since 1906.	

The 21 following colleges either already require one year of work in a college of liberal arts in addition to a four-year high school course, or have announced their intention to do so on or before the year given:

College	In Force
Fordham University, School of Medicine.....	1908
University of North Carolina, Medical Department.....	1909
Oakland College of Medicine and Surgery.....	1910
Denver and Gross College of Medicine.....	1910
College of Physicians and Surgeons, Chicago.....	1910
Hahnemann Medical College, Chicago.....	1910
Kansas Medical College.....	1910
Tulane University of Louisiana, Medical Department.....	1910
St. Louis University School of Medicine.....	1910
Washington University, Medical Department.....	1910
University of Cincinnati, Medical Department.....	1910
Starling-Ohio Medical College.....	1910
Cleveland College of Physicians and Surgeons.....	1910
University of Oklahoma School of Medicine.....	1910
University of Oregon, Medical Department.....	1910
Vanderbilt University, Medical Department.....	1910
University of Texas, Medical Department.....	1910
*University of Virginia, Department of Medicine.....	1910
West Virginia University, College of Medicine.....	1910
Marquette University Medical Department.....	1910
Wisconsin College of Physicians and Surgeons.....	1910
* Requires a three year high school course plus one year of college work.	

Several other colleges announced to us that higher requirements had been adopted. Two have since rescinded their action, five have merged into other colleges, and others, on inspection, being found unworthy of recognition, were omitted from the lists. The schools above named, however, have made definite statements in their announcements regarding the increase in their entrance requirements and doubtless mean what they say.

In support of these higher standards, the State Examining Boards of six states have established higher requirements of preliminary education. These states and the years when the requirement will become effective are as follows:

State Examining Board of	No. of years Required	Affects students matriculating	Affects all applicants after
Minnesota	2	1908-09	1912
Connecticut	2	1910-11	1914
North Dakota	2	1907-08	1911
South Dakota	1	1907-08	1911
Colorado	1	1908-09	1912
Kansas	1	1910-11	1914

Several other states are contemplating a similar increase in their requirements of preliminary education. In some of these

the increase would doubtless be welcomed since then medical colleges have already adopted the increased requirements.

MEDICAL COLLEGE MERGERS

Since our last report there have been five important mergers of medical colleges by which nine medical schools are replaced by four stronger ones. These mergers were as follows:

1 At Louisville, Ky., the Louisville and Hospital Medical College, the Kentucky School of Medicine and the University of Louisville Medical Department united, retaining the name of the University of Louisville Medical Department. This leaves but one regular medical college in Louisville, where there were five colleges two years ago. As a direct result of this merger, the school has received \$25,000 from the city of Louisville and steps have been taken to build a new city hospital, which is to be largely under the control of the medical school.

2 At Cincinnati the merger between the Medical College of Ohio and the Miami Medical College has been completed, the new school to be the Medical Department of the University of Cincinnati. The building of an enormous new city hospital has already been started near the university campus and a new medical college building will be erected adjoining this hospital. The outlook for this new school is very encouraging.

3 The Keokuk Medical College, College of Physicians and Surgeons, located at Keokuk, Iowa, has turned all its property and good will over to the Drake University, College of Medicine, at Des Moines, Iowa.

4 The University of Southern California, College of Medicine, at Los Angeles, has united with the University of California whereby it becomes the Los Angeles Medical Department of the State University. The work of the last two years will be at Berkeley, the student being allowed to take his clinical work either at San Francisco or Los Angeles.

5 The Cooper Medical College, beginning this fall, will be the Medical Department of Leland Stanford, Jr., University, located at Palo Alto, Cal. Three years of work in the liberal arts department will be required for admission. The last three semesters of medical work will be given on the University campus at Palo Alto, the last five at San Francisco.

QUALITY VERSUS QUANTITY

Five years ago there were 166 medical colleges in the United States. Since that time 25 others have been organized, but 43 were closed, leaving 148 at the present time. Of those closed, 16 became extinct and the balance merged into others. That the medical colleges themselves realize the need of improvement in standards and equipment is best shown by the fact that in five years mergers took place replacing 34 medical colleges by 12, which were invariably larger, stronger and better equipped.

There are numerous other cities where mergers might be brought about if those interested in general education and those in medical education in each city would work together to secure them. For example, if all the medical colleges of any large city, such as Chicago, Philadelphia, St. Louis or others could be merged into one great university medical school, such as are to be found in Berlin, Paris or Vienna, it would be of the greatest possible advantage to medical education in this country.

NIGHT TEACHING ABANDONED

Information has been received that the teaching of medicine to students attending only at night or after 4 o'clock p. m., has been abandoned by George Washington University and by Howard University, both located at Washington, D. C., and by Temple College Medical School at Philadelphia. This still leaves four medical night schools, three of which are at Chicago and one at St. Louis.

GRANTING OF ADVANCED STANDING

It is a rather deplorable practice, even with some of the supposedly better grade medical colleges, to allow advanced standing with little or no restrictions for work done in some of the medical schools known to be extremely low grade, from night schools and even from schools not generally recognized by law as medical schools. It is quite encouraging, therefore, to note that an increasing number of colleges are limiting advanced standing to credentials from colleges of known merit.

NEEDS AS REVEALED BY THE INVESTIGATION OF MEDICAL COLLEGES

An investigation of medical education in the United States covering a period of five years and which included one or more personal inspections of each individual medical school, has revealed numerous defects in the teaching of medicine, some of which may be briefly stated as follows.

1 There are too many medical colleges in this country. As shown in our report last year, the United States has nearly as many colleges as the rest of the civilized world combined. The majority of them depend on the fees of students to pay their running expenses.

2 This has led to an active competition for students and to a disregard of preliminary requirements which has not only prevented the medical school from obtaining well trained students, but has also hindered the development of high schools, since students were and are still being admitted with only a grammar school education.

3 The methods of teaching medicine of 15 or 20 years ago are still being followed by a number of our colleges, and the students in many of the schools are not required to have a preliminary training the equivalent of a four year high school education.

4 The medicine of to day, however, really demands of the student a more extensive and thorough preliminary training than is possible in the vast majority of our secondary schools. Experience has shown that this additional preliminary training for medicine should consist of at least one year's work in physics, chemistry and biology, and that a reading knowledge of German and French should also be required.

5 The teaching of medicine to day demands trained teachers, for the fundamental medical sciences there should be instructors who have had special, thorough training in anatomy, histology and embryology, physiology, physiologic chemistry, pharmacology, pathology and bacteriology, and these men should be paid salaries sufficient to permit them to devote their entire time to teaching and research, unhampered by the necessity of keeping up an active practice for a livelihood.

6 In order to properly teach medicine, medical colleges must have hospitals either owned by them or entirely under their control so far as the clinical material is concerned. This is now one of the greatest needs of medical teaching. Our medical students must come into closer contact with patients in hospital wards and dispensaries, where they should be given a systematic, careful training in writing histories and in the methods of the chemical laboratory.

7 If the medical college is of high standard hospital patients would be benefited by the presence of students. The attending physician will be more careful in his examinations and treatment if he is teaching medical students. The trustees of hospitals should have pointed out to them the importance of the educational function of the hospital and the value of a medical school connection.

8 Medical education is but one of the departments of our general system of education, and should be brought into harmony with all other departments. The interests of all departments of education are mutual. What helps one should help all. Medical schools must depend on the high schools, colleges and universities to furnish the preliminary training for medical students. The medical school might also obtain many valuable suggestions from the liberal arts colleges in regard to supervision, standards of equipment and methods of teaching. On the other hand, if the medical college insists on high standards of preliminary education, it will aid and stimulate the work of the secondary schools, colleges and universities.

9 Owing to the confusion in the standards of secondary schools, it requires expert knowledge to place the proper value on preliminary credentials and to judge of a student's qualifications, which information is not at present available for medical schools. The provision for certificates from county superintendents or high school principals has proved to be very unsatisfactory. A number of eastern colleges and universities have solved the problem by requiring that their examinations be held by the College Entrance Examining Board. It might be possible to have preliminary credentials of medical students pass through the hands of that board.

10 There are a number of medical schools known as medical departments of universities which in point of fact have only nominal connection with such universities. In a few instances, there is no real university of the name given, or else the university is made up of schools of medicine, law, dentistry and pharmacy without a liberal arts department. The majority of these are really independent medical schools, the university so called having no control over the standards of teaching, not furnishing any financial assistance to its "medical department."

11 A medical school would be greatly benefited by becoming the organic medical department of a university which has a strong liberal arts department. By "organic" is meant where the medical school and its finances are controlled by the university trustees and where the educational standards are fixed by the liberal arts department. By such connections,

Within recent years, it has been most interesting to watch the transformation of what might better be termed "medical institutions" into, what are in every sense of the term, "medical colleges."

12. Those medical schools which are honestly striving to teach medicine and which have the right ideals should receive endowment. It has been clearly demonstrated time and again that no medical school can demand the necessary entrance requirements, provide the expert all-time salaried instructors, install the thoroughly equipped laboratories and properly supervise the dispensary and hospital teaching without private endowment or state aid. Additional figures have been received during the past year showing that the cost of teaching a student in each of the freshman and sophomore years in the 25 or 30 leading medical schools ranges from \$250 to \$700 or more per year, while the tuition received from each student ranges only from \$65 to \$250 per year. To meet the necessary expenses of properly teaching medicine from students' fees is therefore clearly out of the question.

13. After all that has been said in the last four or five years regarding the needs of modern medicine in money, salaried instructors, laboratories and hospitals, there are still a considerable number of colleges which, from students' fees, are able to pay all expenses and still have a snug little sum at the end of the year to "divide up" among the members of the faculty. And strange as it may seem, it is from these very colleges that we oftenest hear the plea for "the poor boy who wants to get an education" as an excuse for low preliminary requirements, and the question as to "who will practice at the country cross-roads and the back-woods districts" if a thorough medical training is insisted on.

14. There are several medical schools so called which are little else than quiz classes and which are run only to prepare their students to pass state license examinations. Inspection shows they seriously lack equipment or make little use of what they have. Statistics show that "graduates" of these schools are able to pass state license examinations, as they are now generally conducted. This is an argument for the practical state license examination.

STATE LICENSE LEGISLATION AND REQUIREMENTS

Since a year ago several important changes have been made in medical practice acts or in board rulings governing the requirements for license to practice medicine.

PRACTICAL EXAMINATIONS

1. Two state boards, those of Massachusetts and Ohio, included practical tests in the examination of applicants for license. These tests included the making of urinalyses and the identification under the microscope of histologic, pathologic and bacterial specimens. Two other boards, those of Indiana and Minnesota, have announced that practical tests will hereafter be required.

2. In three states, Alabama, Arkansas and Rhode Island, amendments to the practice acts have been secured requiring that all applicants for license be graduates of reputable medical colleges. This leaves only three states, Massachusetts, Mississippi and Tennessee, which still allow non-graduates to secure licenses other than through reciprocity.

3. Indiana, Iowa and Nebraska have provided for examinations in two parts whereby the fundamental medical branches may be passed off at the end of the sophomore year, this credit to be accepted toward the examination for license after the student has graduated. There are now eight states having this two-part examination, as follows:

Colorado,	Maryland,	New York,
Indiana,	Michigan,	Virginia.
Iowa,	Nebraska.	

4. In only one instance during the past four years has a state retrograded in its standards for medical licensure. This occurred during the last year in Oklahoma. A bill for a strong practice act was introduced, but was so sadly riddled by the time it came through the Oklahoma legislature that it provides lower standards than were formerly enforced in the territory of Oklahoma.

5. In four states during the past year recognition was withdrawn from a number of medical colleges. In Indiana from one college which has been closed, in Illinois from five, of which recognition has since been restored, in Missouri from two, to one of which recognition has been restored, and in Texas from two, both of which have been closed. In several other states, while recognition was not withdrawn from colleges, considerable pressure has been exerted by the boards resulting in marked changes for the better.

PROGRESS TOWARD UNIFORMITY IN FIVE YEARS

In the past five years the many changes in practice acts show that the requirements to practice medicine in the various states are approaching uniformity by the process of evolution. These changes are as follows

1. Then only 20 state practice acts made provision for preliminary education; now 36 have such provision. Then no states provided for collegiate education; now six require one or two years of college work as the minimum preliminary requirement. Then only 10 had a 4-year high school requirement; now 22 have that requirement.

2. Then 43 states required an examination of all applicants for license; now all but one state have that requirement. New Mexico still registers graduates from certain medical colleges without the written examination.

3. Then 38 states required that all applicants must be graduates of reputable medical colleges; now all but three have that requirement.

4. Then only about 14 states had full authority to refuse recognition to colleges of low grade; now 29 state boards have full authority and 10 others have limited authority, while only 10 remain without such control.

5. Then all but 13 states had single boards of medical examiners; now only 10 states still have sectarian boards.

6. Then 22 states did not have reciprocal relations with others; now all but 14 states have such reciprocal relations, while two others have legal provision for it.

In the work of bettering medical education in this country, however, there are some other important problems to which attention should be drawn.

CHARTERING OF COLLEGES

In only a few states is there any check on the incorporation or chartering of medical schools. In most states any body of men by paying the required fee can incorporate as a college or university, often with authority to grant any degree under the sun, no question being asked as to the ability to furnish education of the standard generally supplied by the better colleges and universities. And seldom is there any means of control over such institutions, even after they are incorporated.

PSEUDO-MEDICAL COLLEGES

No such unchecked educational institutions are allowed to exist in any other country and, so far as we have been able to learn, in no other country are to be found so many medical sects, or pseudo-medical institutions. There are now some 30 or more nondescript medical fads in a long procession demanding legal recognition, separate boards or representation on examining boards. In some instances the influence has been seriously demoralizing.

SPECIAL LEGISLATION

The chief difficulty in the proper regulation of the practice of medicine in some of the states is the inconsistency of medical legislation. In several instances good, strong medical-practice laws have been enacted providing for fair standards of education but which have been practically annulled by special legislation granting to this or that medical sect special standards, or special boards or representation on examining boards.

THE LOGICAL PROCEDURE

No one should be permitted to practice medicine who is not sufficiently trained to recognize disease, since a proper diagnosis is essential for any treatment regardless of the methods employed. The only logical position to take in the matter is, as has been done in a few states, to fix an educational standard by which all who wish to secure the license to practice medicine must comply. This standard should require a fair amount of preliminary education, which should be at least that of a four-year high school course, and a thorough training of at least four years in a medical school, the first two years of which should be devoted largely to laboratory courses in the fundamental medical sciences, anatomy, physiology, pharmacology, pathology and the like, a knowledge of which is absolutely essential to one who is to differentiate between health and disease. The last two years should be largely spent in the hospital and dispensary, in personal contact with the sick and injured, and should include a thorough training in the clinical laboratory. If this standard is complied with and the examination is passed, then grant a physician's license and let the holder practice as his educated common sense dictates.

RECIPROCITY

Reciprocity, if wisely administered, is a commendable measure and a matter of justice to the old practitioner, who for good reason may be compelled to move to another state. Mis-

understood, however, or poorly administered, it may seriously lower medical standards. It is still quite widely understood, even by some state board members, that if one state has reciprocity with another it means that any doctor licensed by the one state must be accepted by the other, no matter how low the applicant's preliminary training was or from what college he may have graduated. Of course, that idea is entirely wrong, since reciprocity provides that the license from another state may be accepted in lieu only of the written examination. In all other respects the applicant should comply with the standard required by the law of the state in which he is trying to secure license, which standards it is the duty of the licensing board to enforce.

As usually provided in the state practice acts, reciprocity is a discretionary measure, licenses under that measure to be granted only when the board is satisfied that the applicant in every way comes up to the standard fixed by the practice act. It sometimes occurs that an applicant who has failed repeatedly before one board goes elsewhere and passes, then reappplies to the first board for a license through reciprocity. Several boards under such circumstances have very properly refused to issue licenses, and have demanded that such applicants pass their own examinations. Another board, that of Louisiana, has recently published a list of medical colleges which are considered satisfactory, and has barred graduates of all other schools from registration through reciprocity. Such procedure by the boards makes reciprocity in their hands a powerful influence for higher standards.

AGENCIES AT WORK

In the efforts to elevate standards and secure acceptable conditions in medical education many agencies are doing splendid work: The medical colleges themselves, the state examining boards, the associations of medical colleges, the universities and colleges of liberal arts, the confederations of state boards, the medical societies, etc. After all has been said, however, the clear and definite fact remains that the legal power to control and elevate the standards of medical education rests entirely and alone with the state boards. Each organization is doing a work which can not be done by the others. Sometimes the efforts overlap, but should not be allowed to conflict. There is certainly enough work for all, and they are all striving toward the same ideal, namely, the improvement of medical standards in the United States, until they are at least equal to those of our neighbors across the Atlantic.

Respectfully submitted,

COUNCIL ON MEDICAL EDUCATION,
ARTHUR DEAN BEYAN, Chairman,
N. P. COLWELL, Secretary.

The report was referred to the Reference Committee on Medical Education.

The House then adjourned until 2 p. m.

Second Meeting—Monday Afternoon, June 7

The House of Delegates reconvened at 2:30 p. m., and was called to order by the First Vice-President.

Dr. H. BERT ELLIS, California, Chairman of the Committee on Credentials, made an additional report for this committee. The Secretary called the roll.

The minutes of the morning session were read and approved.

Report of the Committee on Ophthalmia Neonatorum

Dr. F. PARK LEWIS, New York, Chairman, presented the following report of the Committee on Ophthalmia Neonatorum, which was referred to the Reference Committee on Hygiene and Public Health:

To the Members of the House of Delegates of the American Medical Association:

Your committee beg leave to report herewith the work accomplished to the present date, together with associate committees appointed, legislation proposed and enacted in the several states, measures undertaken on the part of medical and lay organizations, investigations conducted, reports from schools for the blind and the conclusions to which all of this work seems to give warrant.

SUMMARY OF RESOLUTIONS, COMMUNICATIONS, REPORTS AND COMMITTEES

June 1906—At the annual meeting of the American Medical Association the following resolutions were adopted:

WHEREAS, Notwithstanding the long-continued efforts of the medical profession to make generally known the infectious character of ophthalmia neonatorum and its dangers to sight, the ranks of the

blind are still largely increased annually by those who have unnecessarily lost their vision as a result of this disease; and

WHEREAS, We possess in the silver salts an almost absolute specific for its prevention and treatment, therefore, be it

Resolved, That this Section recommends that a committee consisting of at least one ophthalmologist, one obstetrician, and one sanitarian, with invited cooperation of a sub-committee, consisting of the president and secretary of each state society, be appointed by the President of the Association to formulate and make effective the details of a plan that may give uniform legislation and definite instruction to the profession and laity concerning the prevention and treatment of this disease.

Resolved, That this Section recommend an ophthalmologist for such committee to be appointed by the incoming Chairman and Executive Committee.

Oct., 1906—President W. J. Mayo appointed F. Park Lewis Chairman of such committee and Clifton Edgar and F. F. Westbrook members.

Feb., 1907—Circular letter to members American Medical Association, each member of Committee addressing colleagues in his special section. Also sent to physicians abroad. Questions asked in regard to silver nitrate—whether favored by profession—its strength—free distribution—mention of its use on birth certificate—should ophthalmia neonatorum be classed as communicable disease—penalty for failure to report cases—appointment of committees by the president of each state association to work with health board for better laws. 202 answers—9/10 in favor of all questions.

May, 1907—Return postcards sent out by Buffalo Health Department to Buffalo physicians, midwives and hospitals. Number of cases of ophthalmia neonatorum with results during year's practice. 236 doctors replied, total number of cases 96 of which all but 6 made complete recovery. No replies from hospitals.

June, 1907—Report made to American Medical Association in which it was recommended that work of committee be continued and detailed plan of procedure decided upon with advice of chairman of sections on Ophthalmology, Obstetrics, and Hygiene and Sanitary Science. Recommended cooperation of State and Provincial Boards of Health and American Public Health Association by appointment of committees, and cooperation of State Health Officers and President of each State Society.

Oct., 1907. Paper before American Public Health Association. Resolved that committee of three be appointed. Resolution adopted.

Feb., 1908—Circular letter and model return postcard to the president and secretary of state medical societies and state health officers, recommending appointment of state committees on ophthalmia neonatorum and that health department institute inquiries concerning ophthalmia neonatorum. Replies from 31 medical societies and 12 health departments, also National Government in Panama, Philippine Islands and Hawaii favoring organized movement. Five state committees were appointed.

May-June, 1908—Appointment of committee in each state forming national committee to work with special committee on ophthalmia neonatorum. American Medical Association. Obstetricians appointed by Dr. Dorsett, ophthalmologists by Dr. Wilder and third member from State Boards of Health.

June, 1908—Report of American Medical Association. Conclusions, recommendations. National Congress of Prevention of Blindness urged.

Sept.-Oct., 1908—Circular letter to secretaries of eight District Branches, New York State Medical Society asking them to organize County Societies for this work. Through help of Drs. Bull and Boldt of New York State Committee resolutions were adopted, committees appointed or approval of work obtained in each of the eight districts.

Dec., 1908—Circular letter to each member of National Committee with copy of June, '08 report, asking for state organization by the state committees. 39 replies representing 31 states. Work approved and willingness to cooperate expressed.

March, 1908—Circular letter to members of National Committee and special committees requesting information on progress of ophthalmia neonatorum work in each state in regard to laws, requirements—prophylactics—resolutions—lay movement—number of infected children or statistics—suggestions. 53 replies representing 33 states.

Circular letter to superintendents of state schools for the blind asking for total registration—annual per capita cost—percentage blind from ophthalmia neonatorum, etc. 22 replies.

COMMITTEES

Sub-Committee—ophthalmologist, obstetrician and sanitarian in each state forming national committee with American Medical Association committee as head.

State Medical Societies—California; Colorado; Kentucky; Maine; Missouri; Massachusetts; Ohio—advisory committee for Ohio Commission for the Blind; New York—1st and 8th District Branches, Erie County Medical Society, New York County Medical Society. Other state societies expressed intention of appointing committees later.

Special Medical Societies—American Academy of Ophthalmologists and Oto-Laryngologists; American Public Health Association; American Association of Obstetricians and Gynecologists; American Ophthalmological Association; Conference State and Provincial Boards of Health of North America.

Lay Organizations—American Association Workers for the Blind; New York Association for the Blind, Special Committee on Prevention of Blindness.

RESOLUTIONS AND RECOMMENDATIONS

American Association of Obstetricians and Gynecologists.
American Public Health Association.
American Academy of Ophthalmologists and Oto-Laryngologists.
National Congress of Mothers.
Cincinnati Academy of Medicine—resolutions presented, to be approved.

CIRCULAR LETTERS

1. Members of the American Medical Association and physicians in England, France, Germany and Italy.
2. President and Secretary of State Medical Societies and to President of State Boards of Health.
3. Members National and special committees.
4. Secretaries District Branches New York State Medical Society.
5. Members National and special committees.
6. Superintendents State Schools for the Blind.

PROPHYLACTIC

Nitrate of Silver—Sample ampules made by Parke, Davis & Co.; Estimated cost free distribution in New York State—\$3,000; Estimated cost exclusive of New York City—\$1,500; (Estimates by Dr. H. D. Pease, State Hygienic Laboratory).

ADDRESSES

Medical Society State of New York—1907.

PRESS

Journal of the American Medical Association—Committee report. Ophthalmoscope, England, through Dr. Sydney Stephenson. Large number of medical journals which can only be mentioned in general have made editorial comment and printed papers on the subject of ophthalmia neonatorum. Ohio Commission for the Blind has published a large number of popular articles on ophthalmia neonatorum in stereotyped form in county newspapers.

REPORT FROM HOSPITALS IN NEW YORK STATE ON USE OF PROPHYLACTIC IN EYES AT BIRTH
(Obtained through Secretary of the Committee on Prevention of Blindness, New York Association for Blind)

Hospitals.	Prophylactic Used.			Effectiveness.	Degrees of Reaction.	Remarks.
	Sil. Nitrate, Per Cent.	Argyrol, Per Cent.	Other Solutions, Per Cent.			
<i>Albany:</i> Albany Hotel..	1			Very successful.....	Quite severe, passes away in 2 or 3 days.	
<i>Buffalo:</i> Women's Hos- pital.	2					
Erie County Hospital.	2			Excellent.....	Temporary reaction.	Have large obstetrical practice.
St. Mary's Ma- ternity.	2			Effective except 1 instance..	Slight swelling of eyelids; no reaction.	
<i>New York City:</i> Lincoln Hospi- tal.	1 and 2				Two per cent. reaction irri- tating; all amenable to treatment.	Have used only 1 per cent. solution for past year.
Mt Moriah Hospital.						Hospital not in operation yet; letter referred to Medical Board.
Metropolitan Hospital.	1 or 2	25		Good results from argyrol.		Very few cases of O. N. Had used sil. nitrate 1 to 2 per cent., slight reaction. For past year used argyrol with as good results. Think it safer in nurse's hands.
N. Y. Maternity Hospital.	2				Reaction 48 hours.....	Most of the few cases of O. N. may have been due to 2-day infection.
Post-Graduate Med. School and Hospital.	1			Effective in vast majority of cases.	Mild in occasional case.	
Sloan Materni- ty Hospital.		20				Do not use nit. sil. because of reaction with 2 per cent. Results not as good with 1 per cent. as with 20 per cent. argyrol.
Volunteer St. Gregory Hospi- tal.						Referred inquiry to physicians.
<i>Boroughs Brook- lyn, Queens and Richmond:</i> The Brooklyn Hospital.		20		Very beneficial results.		
Cumberland Street Hospi- tal.		25		Effective in all cases.....	None.....	Degrees of reaction from sil. nit. (?) none.
Flushing Hos- pital and Dis- pensary.		20		Effective in every way.....	Very little reaction.....	No cases of infection.
German Hospi- tal.	2			Effective in all cases.....	Positive reaction.	
Kings County Hospital.	1	1			Sil. nit. practically nil.....	As result of treatment rarely have case of O. N.
Long Island College Hospi- tal.	1 to 1	10 to 20		Failures: nitrate 2 per cent. almost none; 1 per cent. slightly more frequent; 10 to 20 per cent. argyrol, very rare.	Two per cent. nitrate, fre- quently some reaction. 1 per cent. less; argyrol none.	Argyrol given preference because less irritating.
Methodist Epis- copal Hospi- tal.	1 and 2			Seems very effective.....	Hardly any.	
S. S. Smith In- firmery.	2			Very effective.....	Slight; no serious reaction.	
Williamsburg Hospital.	2			Perfect.....	None.	
<i>Onondaga:</i> Onondaga County Hospi- tal			Boric Sol.			Never had a case of ophthalmia neonatorum.
<i>Rochester:</i> Rochester Ho- meopathic Hospital.	1				Good deal of swelling and discharge from eyes in 3 or 4 cases.	No ophthalmia neonatorum in cases where sil. nit. was used.
Rochester City Hospital.		20			Reaction scarcely noticeable.	Almost never case of O. N.
<i>Syracuse:</i> St. Joseph's Hospital.			Boric acid.	Treatment always effective..		No case of O. N. If doctor wishes 1 per cent. of sil. nit. or argyrol used.
Syracuse Hosp. for Women and Children.	1			Always effective except 1 case.	Not any.	
Syracuse Ho- meopathic Hospital.	2			Proved effective.....	Reacts slightly; passes away in day or two.	Most cases private; use 2 per cent. sol. when ordered by physician.
<i>Watertown:</i> St. Joseph's Hospital.	2					Had case of O. N. where sol. was not used.
<i>Utica:</i> Faxon Hospi- tal.						Very seldom used by doctor. Both 1 and 2 per cent. have been used.
<i>New York, Bor- ough of Brook- lyn:</i> The Jewish Hospital.	1	25			Slight in about 10 per cent., moderate in 5 per cent. (seropurulent); bacterial examination negative.	One case of O. N. Have used sil. nit. 1 per cent. in the eyes of all infants up till within 2 months. One case O. N. in 316 maternity cases since open- ing of obst. ward, 1906. Recovered completely. At present use 25 per cent. argyrol freshly made once a week. Think we have the same degree of pre- vention with less reaction.

PROGRESS OF OPHTHALMIA NEONATORUM CAMPAIGN IN STATES AND TERRITORIES, MAY, 1909

Information gathered from answers to three circular letters sent out February, 1908, December, 1908 and March, 1909.

Alabama.—January, 1908. Fairly good health law requires reporting of contagious and infectious diseases but does not include ophthalmia neonatorum. Would take subject up with State Medical Society April, 1908. No answer to last letter.

Arizona.—Making effort to do something along these lines. No midwifery laws—one now before legislature on registering of vital statistics which requires registry of midwives with local registrars. County Medical Society has passed resolutions to secure law for registry of midwives. Registering of births very poorly complied with.

Arkansas.—Apparently nothing has been done. City of Little Rock requires early registration of births, no regulations relative to ophthalmia neonatorum.

California.—Committee appointed by President State Medical Society in April, 1908. At meeting March 5, 1909, Los Angeles County Medical Association adopted resolutions regarding ophthalmia neonatorum.

Colorado.—Committee appointed in April, 1908, by State Medical Society and State Board of Health expressed willingness to cooperate.

Connecticut.—Law passed in 1895 in regard to reporting ophthalmia neonatorum. Two arrests of midwives for violation of this law—both freed by judge in court.

Delaware.—December, 1908—willing to help. No later reports. District of Columbia.—Law of June 3, 1896, requires examination and registry of midwives. April 3, 1909.—Health officer has had statement regarding prevention of ophthalmia neonatorum printed on covers of books in which birth certificates are bound for distribution.

Florida.—No action except in an advisory way. Subject brought before State Association in April, 1908. No action taken. Change in Health Statute may give Board legal authority to do something. Committee interested and doing what it can.

Georgia.—March 1909—President of County Society in annual address mentioned necessity of action against ophthalmia neonatorum. Birth certificates are required. Subject presented to local county and district societies.

Illinois.—February, 1908—Commissioner of Health says the department will do what it can. Births poorly reported in Chicago—do not go to Health Department but to County Clerk—estimated that about 40 per cent. are reported. Secretary State Medical Society writes that subject was taken up about ten or twelve years ago and as a result law was enacted but no prosecutions resulted. 1909—Member of Commission for Blind hopes for permanent commission and legislative action. Law for prevention of blindness enacted by General Assembly copies of which Board of Health will send to every registered midwife in the state.

Idaho.—Registration of births required. Paper on ophthalmia neonatorum read before State Medical Association and printed in Medical Sentinel.

Indiana.—Article in recent Bulletin of State Board of Health on ophthalmia neonatorum. Birth certificates have question: "Were precautions taken against ophthalmia neonatorum?" Certificates must be filed in 20 days. Two or three County Societies have passed resolutions.

Iowa.—February, 1908—President State Medical Society approves and will incorporate subject in annual address and appoint committee. (No notice of committee appointed.) Members of committee doing active work.

Kansas.—Member of committee glad to aid in work. No recent report.

Kentucky.—February 1908—Committee appointed by President State Medical Society. Circular issued by State Board of Health to Health Officials, physicians and people of Kentucky on prevention of ophthalmia neonatorum. Sent to members of medical profession. March 1909—Six years ago attempt made by State Medical Society to pass law for reporting ophthalmia neonatorum—failed in its enactment. Birth certificates registered in large cities but doubtful about country districts.

Louisiana.—February, 1908—Committee appointed by State Medical Society will render what assistance it can. March 1909—Symposium on ophthalmia neonatorum planned for medical meeting in near future.

Maine.—March, 1908—Committee appointed by State Medical Society. An act (date of enactment not given but evidently not recent) on Prevention of Blindness.

Maryland.—February, 1908—Law enacted by legislature of 1894 requiring nurses, midwives and other persons, not physicians, to report cases of ophthalmia neonatorum. Secretary of Board of Health will aid in getting statistics which he considers most important work. March 1909—Midwives required to register with local health authorities. Births must be registered within 4 days. Commission for Improving Condition of Blind appointed by legislature 1906. Was to report in 1907. New midwife bill will be passed at coming meeting of State Society in May.

Massachusetts.—Massachusetts Association for the Blind and Boston Department of Health each issued circular after the amendment of contagious law in 1905 making ophthalmia neonatorum a reportable disease. The Association for the Blind also has a social worker who has made a special study of cases in the Infirmary and made written report of the investigations. Committee State Medical Society has issued a folder on ophthalmia neonatorum, the preventive treatment, suggestions and treatment of the disease.

Michigan.—Law enacted 1895 requires midwife, nurse or attendant to report ophthalmia neonatorum in writing within 6 hours. Law not in practical operation.

Minnesota.—Law requiring a yearly license fee preceded by an examination or diploma from every midwife in the state. March, 1909—State Board of Health regulations require reporting of diseased eyes among infants, and filing of birth certificate within ten days. Inquiry on birth certificate whether prophylactic was employed.

Mississippi.—February, 1908—Secretary State Medical Association approved and promised help.

Missouri.—March, 1908—Committee State Medical Society.

Montana.—Resolutions introduced at State Medical meeting but no action taken. March, 1909—Bill governing practice of midwifery and one on ophthalmia neonatorum failed to pass the legislature.

Nebraska.—State Medical Association directed member of Na-

tional Legislative Council to have State Board of Health incorporate ophthalmia neonatorum with contagious diseases to be reported to local boards of health within 24 hours after their occurrence. On January 1, 1908, rules and regulations adopted by State Board of Health went into effect. March, 1909—Lay movement in connection with Committee of One Hundred. Subject informally discussed at State Medical meeting.

Nevada.—February, 1908—Secretary State Medical Society will endeavor to get together statistics by communicating with every doctor in state and will bring subject before State Association. Law requiring record of births not being heeded by physicians. No later reports.

New Hampshire.—March, 1909—Bill now before Public Health Committee of New Hampshire legislature. No law or regulations at present in state.

New Jersey.—1884 circular on ophthalmia neonatorum issued by State Board of Health and sent to all physicians and midwives. 1895 law passed for prevention of blindness. Law defective—being revised—will have it passed at present (1909) session of legislature. 1896—Subject discussed before State Medical Society and practitioners frequently urged since to use preventive. Midwives licensed after examination.

New York.—State law for Erie, Niagara and Chautauqua counties requires examination and registration of midwives and New York City Health Department has power to conduct examinations. The New York State Commission to Investigate the Condition of the Blind—1906—devotes a portion of its report to ophthalmia neonatorum and its prevention.

Medical Society, County of Erie—Special committee. New York State Medical Society—Committees and resolutions.

New York City.—Physicians required to report ophthalmia neonatorum to Board of Health. Health rule requires midwives to carry 1 per cent. silver nitrate as a part of her equipment and summon a physician if ophthalmia develops.

State Health Department—Sent circular letter to secretaries of the county medical societies with return postcards, secretaries to mail card to each member of his county society who by signing the card pledged to use a prophylactic against ophthalmia neonatorum. Question to be put on birth certificate "Did you employ a preventive for ophthalmia neonatorum? If not, why not?" Free distribution of containers of nitrate of silver in the near future.

Special Committee on Prevention of Blindness New York Association for the Blind—Has issued three pamphlets on ophthalmia neonatorum 22,810 copies of Nos. 1 and 2 have been distributed in the state and 3,505 outside of the state. No. 3—in all 675 copies. Committee has received \$5,000 appropriation from the Sage fund for the continuance of its work and through the efforts of the committee an item of \$5,000 has been inserted in the Supply Bill now before the Governor and if secured this amount will be at the disposal of the State Board of Health for its work in the prevention of blindness. The committee has also secured the passage of a bill for the notification of births within 36 hours instead of 10 days as before.

North Carolina.—February, 1908—State Medical Society will cooperate. No later report.

North Dakota.—Registration of births required. Several local societies adopted resolutions recommending use of prophylactic. Nothing systematic has been done. Lay movements transitory.

Ohio.—March 1908—Proposed amendment to bill establishing commission for the blind which inserted clause "recommending to next general assembly necessary legislation for prevention of blindness with special reference to the new-born." Law in existence making it a misdemeanor for a midwife or general practitioner to treat a case of purulent ophthalmia in the new-born without notifying an oculist or sending the child to some hospital. Fine is heavy and an imprisonment clause. Law not operative at date of writing—1908. State law passed in 1892 concerning ophthalmia neonatorum and suggested that resolutions be adopted by Eye and Ear Section of Medical Society. Subject also urged with Ohio Commission for the Blind. Through Blind Relief Commission resolutions introduced before Cincinnati Academy of Medicine. Same resolutions will be presented to State Medical Society.

Oklahoma.—1908—President State Medical Association will aid in campaign. No health laws at that time in Oklahoma. No later reports.

Oregon.—Letters of approval from Secretary State Medical Society and from ophthalmologist on state committee. 1909—Births have to be reported.

Pennsylvania.—Proposed resolution for State Medical meeting. Circular issued by State Commissioner of Health, and old law passed in 1895 put into force. Circular letter with copy of law sent to physicians in state and to the secretary of boards of health. At December, 1908, meeting of Kensington Branch Philadelphia County Medical Society had symposium on ophthalmia neonatorum with lantern demonstration.

Rhode Island.—1909—Secretary State Board of Health will make yearly canvass of physicians to ascertain the amount of blindness from ophthalmia neonatorum. With the inquiry will send dropper and proper amount of 1 per cent. silver nitrate and will place extra supplies at diphtheria outfit stations and repeat yearly. May, 1909—This has not been done.

South Carolina.—Ophthalmologist on committee interested and willing to co-operate with committee A. M. A. 1909—Early registration of births in some towns. Effort being made to have physicians report all infectious diseases.

South Dakota.—Tennessee.—1908—Subject to be presented to State Medical Society and statistics gathered from Tennessee School for the Blind.

1909—Information indefinite; probably something concerning ophthalmia neonatorum embodied in amendments to medical laws.

Texas.—1909—Birth certificates must be sent in within 30 days. Subject of ophthalmia neonatorum considered at 1908 meeting of State Medical Association.

Utah.—Subject of ophthalmia neonatorum to be brought before next meeting (does not say whether State Medical or Health Board meeting). December, 1908. No further report.

Vermont.—Midwives required to make birth reports same as physicians. Certificate registered within 10 days.

Virginia.—Washington.—In favor of movement. 1908—A bill entitled, "A Law for the Prevention of Infantile Blindness" was to have been introduced at the 1908 session of the legislature. (Not notified whether passed or not.)

West Virginia.—1894.—Resolutions adopted and legislation proposed. In December, 1903, Secretary State Medical Association sent letter on ophthalmia neonatorum to County Secretaries.

Wisconsin.—Law requiring registry of midwives with local registrar and registry of birth certificate within 5 days. 1903.—Proposed bill regulating practice of midwifery and one for prevention of ophthalmia neonatorum. Active work being done.

Wyoming.—1908.—Midwives or unlicensed practitioners not allowed to practice in the state. Births not reported by physicians. No record of cases of ophthalmia neonatorum except in State Hospitals.

Panama.—Circular letter sent out by Col. Gorgas to all physicians in charge of stations and hospitals. Information asked—number of cases of ophthalmia neonatorum during year, results, prophylactic used, strength. Five cases reported, all complete recoveries.

Philippine Islands.—1908.—Local laws regulating practice of midwifery but midwives much below the standard. Births supposed to be reported. Bureau of Health to collect statistics. Report that disease is very rare probably due to large infant mortality. No further report.

Hawaii.—February, 1908.—Attempted census of blind of Islands resulted in finding 28 adults and 7 children. Circular letter of the Committee on Ophthalmia Neonatorum forwarded for distribution. No further report.

QUESTIONS IN CIRCULAR LETTER MAILED MARCH, 1909

I. LAWS ENACTED OR PROPOSED GOVERNING THE PRACTICE OF MIDWIFERY OR THE REPORTING OF CASES OF OPHTHALMIA NEONATORUM

Affirmative

Arizona.—No law at present but modification of the Model Law which requires the registration of midwives with local registrars is now in the legislation.

Connecticut.—Through efforts of Connecticut Medical Association, following resolutions by Dr. H. W. King, state passed law in 1895: Sec. 1. Should one or both eyes of infant become inflamed, swollen or reddened at any time within 2 weeks after birth, shall be duty of midwife or nurse to report in writing within 6 hours to health officers or legally qualified practitioner of city, town or district where parents reside that such inflammation, etc. exists. Sec. 2. Failure to comply with provisions of this act punished by fine not to exceed \$200 or imprisonment not to exceed 6 months, or both. Two midwives brought to trial for neglect were not convicted because the judges said that any baby was liable to have sore eyes. Affair had wide publicity and many mothers now ask their physicians to use drops.

Dist. of Columbia.—Since law of June 3, 1896, no midwife can practice without license or secure license without examination. In April, 1909, Health Officer had following notice printed on book covers in which birth certificates are bound for distribution:

Notice

The Health Officer desires to call attention to the widespread agitation that is now going on with respect to the prevention of such blindness as arises from inflammation of the eyes of new-born children. Aside from the importance of preventing such blindness as a public duty, the fact that the laity is becoming aware that the adoption of proper measures at the time of birth may prevent such a catastrophe renders it peculiarly important that physicians and midwives, in their own interest, adopt in their practice, if they have not already done so, such measures as have the support of the medical profession for the prevention of such loss of eyesight.

Wm. C. Woodward, M.D.,

Health Officer.

Illinois.—State Law on the Prevention of Blindness makes punishable by a fine not to exceed \$100 or imprisonment not over 6 months, or both, any neglect of midwife or nurse to report in writing within 6 hours to health officer or practitioner any inflammation or redness in infant's eyes within two weeks after birth.

Kentucky.—Six years ago attempt made by State Medical Society to pass law for reporting of ophthalmia. Failed in enactment.

Maine.—Fine not to exceed \$100 or imprisonment not to exceed 6 months for failure of midwife, nurse or person having charge of infant to report any redness or inflammation of the eyes occurring within four weeks after birth to legally qualified practitioner of city, town or district.

Maryland.—Law 1894 requires midwife to report ophthalmia neonatorum to phy-

Negative

Arkansas.

California.

Florida.—Health Officer doubtful about authority of board to make rules and thinks statutory law would not be observed without action being taken in court by parties affected through neglect or ignorance of restrictive measures.

Georgia.—No efficient laws on midwifery, none on ophthalmia neonatorum.

Indiana.—Health Officer says Board could require by its rules reporting of cases but does not think it will at present because of trouble to get other contagious diseases reported.

Louisiana.

Nebraska.—No laws but rule of Board of Health giving instructions for prophylactic instillation of silver in Omaha. Nothing obligatory.

North Carolina.

North Dakota.

South Carolina.

Texas.

Vermont.—No laws but midwives required to report births.

Affirmative

Michigan.—Failure on part of any midwife, nurse or other person having charge of infant to report in writing within 6 hours any inflammation, redness or formation of pus, occurring in the eyes within 2 weeks after birth, to local health officer or some legally qualified practitioner in city, town or district, shall be punished by a fine not to exceed \$100 or imprisonment not to exceed 6 months, or both, in the discretion of the court. "Law not in practical operation as far as the reporting is concerned and therefore the use of preventive measures is optional on the part of the attending physician."

Minnesota.—Regulations State Board of Health. One or both eyes of infant become inflamed, reddened or diseased within 2 months after birth, shall be duty of midwife, nurse, parent or other person having charge of infant to report in writing within 12 hours to local health officer of city, village or township. Health officer on receiving report shall visit child and provide immediate medical treatment unless already under charge of practitioner.

Montana.—Bills governing midwifery and reporting of ophthalmia failed to pass Legislature of 1908-09.

New Hampshire.—Bill now before the public health committee of the Legislature looking toward the control of ophthalmia neonatorum.

New Jersey.—In 1884, on recommendation of Dr. C. J. Kipp, circular giving method of prevention and treatment of ophthalmia neonatorum issued by State Board of Health and sent to all known physicians and midwives. In 1895 law passed for the prevention of blindness. This law found defective and State Attorney General requested to put it in shape and it will be passed by Legislature at this session. Midwives are licensed after examination. In 1896 subject of ophthalmia neonatorum brought before the State Medical Society and preventive measures urged. Number of cases brought to dispensaries much smaller than it was years ago. Act introduced in Senate Feb. 9, 1909, whereby applicant in midwifery is examined in cause and effect of ophthalmia neonatorum. Section 6 revokes license for failure to secure attendance of a reputable physician in case of . . . or inflammation or discharge from eyes of new-born infants.

New York.—Law for Erie County enacted in 1885 makes punishable by fine from \$50 to \$100 and forfeiture of license any attempt to practice midwifery without having secured certificate through examination by Board of examiners, payment of fee of \$10 and recording of certificate by county clerk. (Similar law in two other counties and one city.) Concerning ophthalmia neonatorum, state law enacted in 1892, modified in 1901, makes it a misdemeanor for midwife, nurse or other person to fail to notify local health officer or practitioner immediately of any redness, swelling, etc. of eyes of infant within two weeks after birth.

Ohio.—State law, 1892, requires midwife, nurse or relative to report in writing within 6 hours to physician or local health officer any inflammation, redness, swelling or discharge of eyes of new-born infant, under penalty of fine of \$5 to \$100 or imprisonment from 30 days to 6 months, or both. Law making the treatment of ophthalmia neonatorum by midwife or general practitioner without notifying an oculist or sending child to hospital, a misdemeanor. Fine is heavy and an imprisonment clause. *Not operative.*

Negative

Affirmative

Pennsylvania—Law of 1895 makes it the duty of midwives and nurses to report to health officer or practitioner in writing within 6 hours any indications of ophthalmia neonatorum. Health officer to give instructions regarding treatment. Penalty, fine not to exceed \$200 or 30 days imprisonment, or both. Commissioner of Health will enforce this law and has sent copies of it with circular letters to physicians in the state and to secretaries of all boards of health.

Rhode Island—Law of April 19, 1892, makes punishable by fine not exceeding \$100 or imprisonment not exceeding 6 months, or both, neglect of any midwife, nurse or other person to report in writing within 6 hours to the health officer, or practitioner of medicine, inflammation or redness of the eyes of an infant in their care. Every health officer shall furnish a copy of this act to every midwife or nurse in his city or town, secretary of state shall cause sufficient number of copies to be printed and supply same to the health officers.

West Virginia—At State Medical Meeting, 1894, after paper on "Legislation for the Prevention of Blindness" following resolution unanimously adopted and proposed law passed one House but failed in the other.

WHEREAS: The Medical Society of West Virginia recognizes the necessity of legislation for the prevention of blindness by ophthalmia of the new-born, be it

Resolved: That it heartily recommends (through its Committee on Legislation) that the people of the state of West Virginia represented in Senate and Assembly, do enact as follows: Fine not to exceed \$200 or imprisonment not to exceed 6 months, or both, for failure of midwife or nurse to report in writing within 6 hours to legally qualified practitioner any inflammation, swelling or redness occurring in eyes of infant within 2 weeks after birth. At the same meeting it was resolved that the people of the state enact that an examination of the blind, deaf and dumb in the state asylum be made twice a year by a physician expert in such diseases.

Wisconsin—Since October, 1907 every midwife required to register with local registrar and birth certificate must be filed with local registrar within 5 days after date of birth. Feb. 16, 1909, proposed bill regulating practice of midwifery referred to Committee on Public Health and indefinitely postponed and March 4, 1909, second bill on practice of midwifery proposed requiring midwives to be examined by board of examiners, registered, fee of \$10 for examination and \$5 for certificate paid. Good moral and professional character must be sworn to by two reputable physicians or surgeons and one layman, preferably a clergyman. The consent of at least 6 members of the Board necessary to issuance of certificate. Board of Examiners have power to make such rules and regulations governing examinations as may be necessary. Certificate to be filed with registrar of deeds of county or registrar of vital statistics in city. Violation of any provision of this act punishable by fine of not less than \$25 or more than \$100 for each offense or imprisonment not exceeding 6 months, or both. Bill on Prevention of Ophthalmia Neonatorum introduced Feb. 16, 1909, reached Senate, reported for concurrence by Committee on Public Health and is in hands of Committee on Judiciary. State Board of Health authorized to make and enforce such rules and regulations and to publish and distribute such literature to midwives, doctors and nurses or other persons as it considers necessary for the prevention of ophthalmia neonatorum. Requires such prophylactic treatment by physicians, midwives, nurses and other attendant as State Board of Health may determine and the reporting by nurse, parent or attendant to local board of health within 6 hours of any case developing within two weeks after birth. Report to be made in writing. Board of Health to notify physician in attendance or employ competent physician at expense of town to examine and treat case. On receipt of report, no physician being in charge, the health officer shall notify parents of danger to infant's eyes and shall also enclose directions for proper treatment. Fine of not over \$100 for violation of this act.

Negative

II. ARE PHYSICIANS REQUIRED TO REPORT THIS DISEASE?

Affirmative

Massachusetts—Physician shall immediately give notice in writing over own signature of ophthalmia neonatorum to selectmen or Board of Health of the town or forfeit not less than \$50 or more than \$200 for each offense.

New York—A regulation of the New York City Board of Health requires all physicians to report such cases at once to the Board.

North Dakota.
Ohio.
Oregon.
South Carolina—Effort being made to have physicians report all contagious diseases.
Wisconsin.

III. ARE PROPHYLACTICS PROVIDED BY THE HEALTH DEPARTMENT FOR GRATUITOUS DISTRIBUTION?

Affirmative

New York—An item of \$5,000 was inserted in the Supply Bill, this sum to be used by the State Department of Health for the Prevention of Blindness—more especially for the suppression of infant ophthalmia. This will enable the State Health Commissioner to supply a free prophylactic (through local Health Officers) to physicians and midwives, to be used for protecting the sight of children at birth.

Rhode Island—State Health Department has sent out a circular letter to physicians with a small box containing an amber vial of 1 per cent. silver nitrate and a dropper for use in the prevention of ophthalmia neonatorum. Duplicate outfits to be obtained, free, from the diphtheria stations. Accompanying the vial and dropper are directions for using with a request to report any objections to the form of the dropper or any bad results from its use. The circular letter also contains a copy of the law in regard to prevention of blindness.

Negative

Arizona.
Arkansas.
California.
Connecticut—Health department never been asked to give prophylactic. Would probably do so.
District of Columbia.
Florida.
Georgia.

IV. DO THE REGULATIONS PROVIDE FOR THE EARLY REGISTRATION OF BIRTH CERTIFICATES?

Affirmative

District of Columbia—Certificates must be registered not later than the Saturday first ensuing after the expiration of three secular days immediately following the date of birth.

Maine—Early registration. Certificates sent to town or city clerk.

Maryland—Within four days.

Minnesota—Ten days.

Montana—Ten days.

New Hampshire—Six days.

New York—The Legislature has passed a bill requiring all births to be reported within 36 hours after the child is born. Former law ten days.

North Dakota—

Ohio—Ten days.

Vermont—Ten days.

Wisconsin—Within five days with local registrar of vital statistics.

Negative

Arizona—Present system secures only small percentage.

Arkansas—City of Little Rock requires early registration.

California.

Connecticut—Certificates filed on or before 7th day of month next after birth.

Florida—Law providing for registration of birth certificates very irregularly complied with.

Georgia—Required. Time not given.

Idaho—Required. Time not given.

Indiana—Twenty days.

Affirmative

Negative

Kentucky — Certificates registered in large cities; not sure about towns
Massachusetts—On or before 15th of each month.
New Jersey — Thirty days
North Carolina
Oregon — Time not given
South Carolina—Some local boards require early registration
Texas—Thirty days

Affirmative

Negative

Kentucky—State Medical Society appointed committee to draw up a circular in regard to the dangers and prevention of ophthalmia neonatorum. Circular distributed to members of medical profession in Kentucky
Maryland—In 1892 the State Medical Society endorsed the movement started by Dr Woods for a law requiring the reporting of ophthalmia neonatorum and an act was presented to the Legislature by a committee of the society

Massachusetts—State Medical Society appointed a committee of five in 1908 "to consider what measures should be taken by the Society to prevent the occurrence and secure the prompt and effective treatment of ophthalmia neonatorum." The committee has recently issued a folder on ophthalmia neonatorum, preventive treatment, suggestions, and treatment of the disease, with a copy of the Massachusetts law in regard to ophthalmia neonatorum. In the folder the Committee advises for preventive treatment the instillation of a few drops of 25 per cent argyrol or 5 per cent protargol, which should be freshly prepared for each confinement case. Suggests that doctor instruct nurses to report cases to him at once and call their attention to the law; that cases should be put under the care of an oculist when possible or sent to the hospital, that infectious nature of the disease should be impressed on members of the family. Treatment after the disease develops wash eyes every 40 minutes with 3 per cent boric acid solution night and day and 25 per cent argyrol or 5 per cent protargol freely every 4 hours. Folder to be distributed to members of the State Society and "and patients" has been prepared. Association and will be presented to State Medical Society at next meeting

Montana—At last meeting of the State Society a resolution was introduced referring to this matter but no action was taken. Will be taken up at next meeting

New Jersey—In 1896 subject of ophthalmia neonatorum brought before State Medical Society and preventive measures urged and many times since prevention has been suggested. No definite action taken

New York—At State Medical meeting it was resolved "That this Society appoint a State Committee" shall put itself in communication with the State Board of Health and with each County Society to adopt a method to put a stop to ophthalmia neonatorum

"That it be recommended that the State shall make sufficient appropriation to the State Board of Health to put necessary enactments into force, and to prosecute their violations

"That a law be passed compelling persons practicing midwifery to use such prophylactic as may be recommended by the State Board of Health. Neglect of this to be prosecuted as a misdemeanor, except the person be a physician who does give a valid reason for the omission acceptable to the Board of Health or its Committee of the County Society to which he belongs

"That ophthalmia neonatorum be placed on the list of communicable diseases by the State Board of Health, and by all the local Boards of Health

"That every case of ophthalmia neonatorum be reported by any one to whose knowledge it may come to the Board of Health within 24 hours of the first symptoms of its manifestation. Neglect to be prosecuted as a misdemeanor

"That energetic, concentrated and well ordered action be urged and taken at once by this State Society and that it work in harmony with the Central Committee of the American Medical Association and the State Board of Health"

First District Branch—It was moved that the Branch approve of the action of the American Medical Association to bring to the notice of the medical profession the abuses arising from negligence resulting in ophthalmia neonatorum, and further moved that a committee be appointed to inquire into the plan for the prevention of ophthalmia neonatorum. Carried. A committee was also appointed to cooperate with the State Department of Health in a plan now under consideration by the Division

V IS AN INQUIRY MADE ON THE BIRTH CERTIFICATE WHETHER A PROPHYLACTIC HAS BEEN EMPLOYED, AND WHAT WAS THE REASON FOR ITS OMISSION WHEN OMITTED?

Affirmative

Negative

Indiana—Certificates have on them the question, Were precautions taken against ophthalmia neonatorum?

Minnesota—An inquiry is made on the birth certificate as to whether a prophylactic has been employed, etc

New York—Inquiry, "Did you employ a preventive for ophthalmia neonatorum?" If not, why not?" will be placed on certificate in future.

Wisconsin—Will on new certificate

VI HAVE ANY SPECIAL RESOLUTIONS BEEN PROPOSED OR ACTION TAKEN BY THE MEDICAL SOCIETIES FOR THE CONTROL OF THIS DISEASE?

Affirmative

Negative

Arizona — Cochise County Medical Society passed resolutions to secure a law for the registration of midwives

California—At Los Angeles County Medical Society, March 1909, program devoted to ophthalmia neonatorum and at next meeting resolutions adopted "that all members of the Association be urged to spread the knowledge of the great value of the Crede method of silver nitrate instillation as a preventive of ophthalmia neonatorum, and that all practitioners and midwives should use this method in obstetric practice. That this Association request the California State Board of Health to make the prevention of ophthalmia neonatorum a matter of special consideration and action and that a copy of this resolution be sent to that Board and copies be sent for publication to the Bulletin of the Association and to the Journal of the Medical Society of the State of California"

of the Connecticut-secured passage of

Florida—Subject brought before State Association by its president in April, 1908. No action taken. Official Bulletin, State Board of Health for January, 1909 contains article on the effort to prevent blindness, commending the present campaign and describing method of prevention

Georgia—At request of Dr Hodgson, president of county society, in annual address spoke of necessity of action. Dr. Martin secured endorsement of movement in local county and district societies. Subject to be presented in June

Idaho—Article read by Dr Hugel of Boise, on ophthalmia neonatorum before State Medical Association and article printed in Medical Sentinel

Indiana—Two or three County societies passed resolutions. State society has taken no action but will at next annual meeting. State Board has been talking the matter over throughout the state

Arkansas
District of Columbia
Louisiana — Symposium on ophthalmia neonatorum and hope to pass resolutions at state meeting in May
Maine
Nebraska — Some time ago resolution passed in medical society, but bill failed in legislature, will make another attempt at coming meeting
New Hampshire
North Carolina
Oregon
South Carolina
Texas — Subject presented at 1908 meeting of State Medical Society
Wisconsin — Secretary of State Medical Society suggests appointing committee for investigation of subject and collection of statistics.

Affirmative

of Communicable Diseases. The president appointed the secretary of each County in the Branch as a member of this committee.

Second District Branch—Secretary was directed to send copies of a communication regarding ophthalmia neonatorum to the delegates of the Medical Societies constituting the 2d District Branch, these delegates to bring this matter before their respective societies for action.

Sixth District Branch—Resolution adopted advocating means for the prevention of blindness due to ophthalmia neonatorum and all members signed cards, as requested by the State Board of Health.

Eighth District Branch—Committee of the president of each County Society of the 8th District Branch appointed to see that the recommendations of the committee of the American Medical Association were brought before each county society and some action taken in the matter.

Third District Branch—Paper read on Ophthalmia Neonatorum.

State Department of Health—Letter to the secretary of each County Medical Society accompanied by ophthalmia neonatorum pledge postcard, which secretary was instructed to send to each member of his Society.

Medical Society, County of New York—Resolutions unanimously adopted regarding ophthalmia neonatorum and favoring a congress for studying ways and means for the prevention of blindness to be held in Washington in 1910.

North Dakota—Resolutions of several of the local societies have been adopted recommending the employment of prophylactics for ophthalmia neonatorum.

Ohio—Considering plans for a symposium on ophthalmia neonatorum and a special report to the State Society with a discussion at each district medical meeting. Also urged subject with members of the Commission for the blind. Resolutions presented to the Cincinnati Academy of Medicine endorsing the movement against ophthalmia neonatorum of the American Medical Association, pledging themselves to absolute cleanliness in obstetrical practice, recognizing the value of prophylactic treatment, urging the instruction of nurses and midwives, and asking of State Board of Health that ophthalmia neonatorum have the same consideration as any other infectious disease and that the law now on the statute books be enforced. Also that the birth certificate contain clause in reference to preventive treatment, that a report of all cases be required and investigated and recommending the cooperation of medical societies of the state with the State Health Department so that authority and adequate appropriation might be obtained for the successful carrying on of the work.

Pennsylvania—Symposium on ophthalmia neonatorum by the Kensington Branch of the Philadelphia County Medical Society.

West Virginia—In 1894 two resolutions adopted by the State Medical Society. (See under Question 1, affirmative, West Virginia.) Will be presented to State Association in October.

VII. HAVE ANY MEASURES BEEN TAKEN TO DETERMINE HOW LARGE A NUMBER OF NEW-BORN CHILDREN HAVE BEEN INFECTED OR WHO IS RESPONSIBLE FOR THESE INFECTIONS?

Affirmative

Florida—Inquiry made at the State School for the Blind from which reply is received that there are no records of such cases, but that at an early date will incorporate inquiries upon admission blanks.

Louisiana—Unable to obtain any satisfactory data from State School for the Blind. Statistics meager.

Maryland—Had State Commission of Blind which was to secure list of blind persons in state with, among other information, cause and extent of blindness.

Nebraska—Some years ago inmates of School for Blind examined and found not more than seven or eight per cent. of the inmates suffering from effects of this disease.

Ohio—Census now being taken of the blind, with the causes of blindness.

Wisconsin—In the investigation which has been made by the State Board of Control with assistance of State Board of Health in regard to the number of blind persons in the state reveals the fact that from 25 per cent. to 40 per cent. have become blind as a result of ophthalmia neonatorum.

VIII. LAY MOVEMENTS FOR THE CONTROL OF OPHTHALMIA NEONATORUM WHICH HAVE BEEN INAUGURATED?

Affirmative

Illinois—Commission to Inquire into the Condition of the Blind, appointed by the Illinois State Board of Charities, in its report of December, 1908, suggested a form of law in which the Board of Health be vested with authority to publish and distribute such information and furnish such remedies as it deemed expedient to prevent the development of ophthalmia neonatorum, in public hospitals or institutions in which midwifery is practiced and in connection with the practice of midwifery. Rules, regulations, and ordinances to be enforced at the expense of the state. Any person violating any rule, regulation or ordinance to be guilty of a misdemeanor and punishable by a fine not to exceed \$100 or imprisonment not to exceed 6 months, or both.

Maryland—The Mothers' Relief Society furnishes the services of a skilled woman physician to mothers. Has employed the services of a well qualified woman to look into the midwife question.

Massachusetts—Important work is being accomplished through the efforts of the Massachusetts Association for Promoting the Interests of the Blind in its efforts to prevent blindness resulting from ophthalmia neonatorum. Through the courtesy of the Massachusetts Charity Eye and Ear Infirmary, a physician who was also a social worker was permitted to visit daily the out-patient department of that institution and to use its records in a special inquiry concerning this subject on the basis of social service. The report of the investigations of this committee is of very great value and so supplemented the work of the dispensary physicians that the work accomplished cannot be too highly commended. In addition to a large amount of other valuable work 46 cases of ophthalmia neonatorum were individually investigated. Of these the birth of 31 children had been attended by a physician, 5 by a dispensary physician, 6 births took place in hospitals, 3 were attended by midwives and one was unattended by either physician or professional midwife.

"Of the 31 children whose birth had been attended by a private physician, 20 were referred to the Infirmary by the attending physician, 11 by other advice. Of the 5 attended by the dispensary physician all were referred to the Infirmary by him. Of the 3 attended by midwives, none was referred to the Infirmary by them. The 6 whose births took place in hospitals were all directly referred to the Infirmary. The one unattended by either physician or midwife was later sent to the Infirmary by a dispensary physician."

In a short history of twelve cases only two have been pronounced blind. "In three other cases, however, it is very doubtful if the children can be educated as seeing children, and they will probably be pushed into that already large group of 'border-line' cases of those who are neither blind nor seeing, and are a greater problem socially than the wholly blind."

"To measure fully the unfortunate results from this disease it is necessary to take into account also the very high mortality among the children of this group. Statistics gathered by the State Commission for the Blind for the period 1902-7, inclusive, show only 14 cases of blindness from infant ophthalmia in Massachusetts within that time. These statistics are necessarily incomplete and include only those children made wholly blind who have lived long enough to attract attention. They are in reality no index to the bad results from infant ophthalmia. From a list of 18 cases

taken from the records of the Gardner Ward during the period covered by the commission's figures, 1902-7, all of whom were admitted to the hospital totally or partially blind at ages ranging from ten days to three months. 6 totally blind are known to have died since. 1 not found are totally blind if living; and in the case of the remaining 8 there is a question as to whether the children if living, can be educated as seeing children. This list is exclusive of the figures of the State Commission.

"The records of the Gardner Ward for this period, 1902-7, show that 577 cases of infant ophthalmia have been treated within that time. Of this number the cornea was involved in 117 cases before admission. However, the figures for the successive years show a decided improvement; for whereas the number of cases in which the cornea was involved on admission in 1902 was more than one-third of the whole number treated the number of such cases in 1907 was less than one-fifth of the whole. A corresponding improvement is shown in the matter of the age at which the infants are brought to the hospital, while the number treated in a year has doubled in that period."

"Too few cases are covered in this group to form any opinion as to the responsibility of midwives for neglect or ignorance in this disease, but it is generally well known that in Boston at least, so well covered by free dispensary services, the midwife finds comparatively little to do."

Nebraska—Lay movement in connection with the Committee of One Hundred but as yet nothing very definite has been done.

New York—Special Committee on the Prevention of Blindness, New York Association for the Blind. This committee has published three pamphlets of which 27,000 copies have been distributed. The second, a thirty page pamphlet entitled: "Children Who Need Not Have Been Blind. Prevention a Public Duty," discusses ophthalmia neonatorum under the following sub-headings—midwives—the medical profession—health officers—the public—committee on the prevention of blindness—recommendations—legislation, and in the Appendix gives 'Care that should be given the child at birth to prevent ophthalmia neonatorum' and 'What must be done when inflammation of the eyes appears'."

The secretary of the committee has delivered several lectures with lantern slides on the subject of ophthalmia neonatorum.

Through an appropriation of \$5,000 from the Sage Fund the committee is enabled to continue its work for the coming year.

Virginia—No replies to any of the circular letters, but the University of Virginia has announced a summer course of six weeks in preventive medicine which should include ophthalmia neonatorum. The course is especially arranged for health officers, medical inspectors and similar public officers. A course of lectures will be given also during the year on selected topics of public health.

IX. HAVE YOU ANY SUGGESTIONS TO OFFER THE COMMITTEE THAT MAY BE HELPFUL IN SECURING CONTROL OF THIS DISEASE?

Connecticut—Dr. H. S. Miles, Bridgeport: "Every year since the passage of the law I have gone before the nurses in our general hospitals, read the law and dwelt upon the importance of it, and it is a suggestion that I would make that this be done in every hospital where possible."

District of Columbia—Dr. Wm. C. Woodward: "To determine what is the best solution to be instilled into the infant's eyes."

Idaho—Dr. Hugel, Boise: "Would advise the committee to prepare a lucid and concise statement upon the subject and have it printed in the American Medical Association Journal and other leading journals."

Indiana—Dr. J. N. Hurty, Indianapolis: "Persistent and emphatic agitation of the situation in order to secure results in the future."

Kentucky—Dr. S. G. Dabner, Louisville: "Would appear to me that some good could be accomplished by health authorities calling attention to the prevalence and dangers of this disease through public press. Organized effort on the part of various charity organizations and societies devoted to civic improvement." So long as knowledge remains almost confined to medical profession believes that cases will continue to occur not infrequently.

Maryland—M. L. Price, Secretary State Board of Health: Frequent circular letters to physicians and midwives, the registration and requirement of proper educational qualifications for the latter,

Negative

extending work of state and municipal laboratories, examination of ocular discharges, and providing prophylactic materials free of cost and placing these with present stations for bacteriological outfits.

Dr. William Woods, Baltimore: Lectures of instruction to poor women who employ midwives; circular letter to every medical school in the country, enough to teach every graduate.

Michigan—Dr. J. H. Carstens, Detroit: "It seems to me that all that is really needed is to stir the bonds of health up and make them enforce the law."

Montana—Dr. Donald Campbell, Butte: "I have no suggestion to make that could help the committee, except to urge members of our profession to get interested in politics. One good working doctor in the state legislature is worth twenty at home when it comes to getting bills through the house."

CONCLUSIONS

The report of the work already done for the control of ophthalmia neonatorum is given somewhat in detail in order that it may be shown that the whole country is in hearty accord with the movement and that the organization for its control has been very largely perfected.

Resolutions, however, mean nothing more than that our profession is prepared to begin active work. All that has been done is to make the preliminary arrangements. It is now time for a forward movement.

Your committee has had neither the authority nor the desire to recommend any special form of prophylactic, nor until the subject is more exactly determined upon is it desirable to do so. While a large number of opinions have been obtained from ophthalmologists and obstetricians relative to the comparative value of the several germicides, no one of them is wholly free from objection. It has been shown, however, by the experience of the late Dr. Snell in the Jessop Hospital at Sheffield that great care in asepsis, in other words a careful sanitary toilet, will prevent infection in a large proportion of cases and if this be supplemented by the judicious use of any of the silver salts chosen, and by prompt treatment when infection occurs, the disasters of the disease will be practically reduced to the vanishing point. In each state is a committee of experienced physicians ready to advise with the Department of Public Health as to methodology and therefore it has been deemed wise to urge that in every state the subject be taken officially under consideration with them.

The attention of the committee has been directed to the fact that in a disproportionately large number of cases reinfections have occurred where prophylaxis has been employed. This differs so widely from careful records obtained from large numbers of cases as to lead to the belief that often the solutions are used in a perfunctory or careless way or are not prepared in a proper manner. When any silver salt is used it should be in fresh solution, unless it be prepared in hermetically sealed and light proof receptacles, and used but once for prophylaxis. The Department of Public Health should make very clear that when the nitrate is employed some reaction follows or the inexperienced may regard the transitory redness and slight gummy secretion as an infection and employ active treatment where none is required, to the detriment of the cornea. If infection occurs its treatment should be immediate and under intelligent medical supervision. Subsequent to prophylaxis the newer and less irritating silver salts are far safer in the hands of the physician who is unused to the treatment of the eyes and it should always be made clear that the treatment of a birth infection of the eyes MUST NEVER BE UNDERTAKEN BY A MIDWIFE OR A NURSE. When inflammation develops a physician should immediately be called. When, too, a prophylactic is freely distributed by a Department of Public Health it should be accompanied by a brief description of the symptoms of the disease and the necessity for prompt treatment and the records of results together with the reactions should be obtained and made a basis for continued protective work on these lines.

To achieve success two things seem to be necessary—publicity and the placing of responsibility. As in the campaign against tuberculosis which is making such wonderful progress the aid of the public is essential. But before the public can be actively interested the conditions must be thoroughly understood. "It goes without saying," said a great public journal, "that if the conditions of living in the United States are to be improved the facts must first be ascertained." It should be the duty of the local committee in each state to secure the facts concerning ophthalmia neonatorum. The public health authorities are willing to take any action that responsible physicians ask them to take. In some instances laws must be enacted giving authority to the department of public health to insist upon proper reports being promptly filed, but in many states the power of this board is already adequate and in no instance is it desirable to have laws put upon the statute books until they are demanded by a public sentiment that will secure their

enforcement. To create this sentiment is a responsibility placed upon each one of us.

When the mystery of birth infections shall have been removed, when mothers know that their babies may become blind unless suitable precautions are taken, when they learn that destruction of an infant's eye is in almost every instance due to the neglect of right measures on the part of the attendant, no midwife or careless doctor will dare for her or his own sake to risk the criticism or more serious penalty which must be paid for such criminal negligence. It should be the duty of our committee therefore to secure by cooperation with the department of health in every community, or such other method as may be desirable, by the issuance of impersonal descriptive leaflets, by public lectures, by practical exhibits and otherwise, a widespread knowledge concerning ophthalmia neonatorum, its methods of infection, its prevention and the necessity of immediate and proper treatment. With such knowledge, the public will readily and heartily join in any rightly directed movement for its control.

Responsibility must be placed. In some of the cases brought too late for successful treatment to the Massachusetts General Hospital the parents were urged to secure treatment for the child not by the doctor or midwife under whose ministrations the infection had occurred, but by other physicians or friends, the attendant in the case leaving the hopeless infant to his fate. When such cases occur, the facts being authenticated, a midwife should be deprived of her license to practice, or if a doctor, he should be required to make adequate explanation to the board of health. Such people are a menace to the public and unworthy of the profession which they misrepresent.

This placing of responsibility can be secured only by recording the notice of the birth with the properly constituted authority when it occurs, and that this may be effective it is necessary that the registration be made soon after the child is born. The recent English law on this subject is most important. In an enactment of parliament of 1907 providing for the early notification of births it requires that "it shall be the duty of the father of the child if he is actually residing in the house at the time the birth occurs, and of any person in attendance upon the mother, at the time of or within six hours after the birth, to give notice in writing of the birth to the medical officer of health of the district in which the child is born." The notice is given by means of a prepaid letter or postcard, provided by the department of health, within thirty-six hours after the birth of the child. "This is in addition to and not in substitution of the usual statistical report of the birth." If upon such a report a statement be required as to whether or not a prophylactic has been employed against ophthalmia neonatorum it serves as a warning and a record and would enable the department to keep in touch with births in the poorer districts in which often the eyes of the child are lost before the authorities know that an infant has been born.

It is therefore earnestly recommended that the committees which have assumed the responsibility of cooperating with the central committee actively begin an organized movement for the control of ophthalmia neonatorum in their several states or territories. The local conditions relating to the practice of midwifery should be studied, the number and character of the midwives, the number of birth infections of infants' eyes with the results, the legal conditions concerning the practice of midwifery, and the reporting of ophthalmia neonatorum, co-operating with the health department in seeing that births are promptly reported and securing the assistance of the lay public in making widely known the dangers which may menace the eyes of any new-born child.

The vast importance of this work seems to grow even greater as its practical attainment becomes more possible. The movement which had for its end the control of ophthalmia neonatorum in the United States has now grown to be one in which the whole civilized world has joined. The committee of the British Medical Association is working with energy and enthusiasm, but by far the most important action was that taken by the Eleventh International Ophthalmological Congress at the session held at Naples on April 3. At that time and place were gathered ophthalmologists representing all of the civilized nations of the globe. Resolutions were adopted recognizing the importance of ophthalmia neonatorum as a cause of blindness and the practicability of its control was admitted by the appointment of a committee charged with the duty of its consideration. To us this gives an added inspiration and doubtless between the states will be a friendly rivalry to determine to which shall belong the honor of being the first to wipe out a pestilence that has existed from time immemorial.

F. PARK LEWIS, Chairman.
J. CLIFTON EDGAR.
F. F. WESBROOK.

Report of the Committee on Organization

DR. J. N. McCORMACK, Kentucky, Chairman, presented the report of the Committee on Organization, which was referred to the Reference Committee on Reports of Officers:

To the Members of the House of Delegates of the American Medical Association:

Following the Chicago meeting, acting with the Committee of One Hundred and other friendly lay interests, an active campaign was begun which secured an endorsement in the platforms of both the leading political parties of the plan for such a consolidation of all the bureaus and divisions performing public health functions at Washington as would lay the foundation for such a National Health Department as would meet the rapidly growing demands of this country. Under your instructions again, and still acting with the lay interests above mentioned, and having the cordial support of President Roosevelt and members of his official family, a conference was arranged at Washington between the heads of departments, bureaus and other organizations you had indicated, looking to the consolidation above mentioned. After full consideration, an amendment prepared by the Walcott Commission at the request of President Roosevelt, having the consolidation in view, was approved with but two dissenting votes. Later this amendment was agreed to by all interests and placed in the hands of the proper official for presentation to Congress, but it never reached that body, and all the work came to naught, at least for that session. Finding that the opposition to our legislation could be neither placated nor overcome, with the approval of your Committee on Legislation. I left Washington and took up my regular work in the field, and ask to be excused from all further duty there.

During the year, I have made comprehensive itineraries in the states of South Dakota, Colorado, Ohio, Virginia, Kansas and Missouri, speaking two, three and often four times daily to medical and lay audiences, state universities, normal and high schools and similar bodies, and before joint sessions of the legislatures in North Carolina, Indiana, Minnesota, Missouri and Kansas. The character, extent and results of this work have been so faithfully reported in your JOURNAL and those of the state associations that it is only necessary for me to tell you here of the growing interest in the subject of organization, lay quite as much as medical, which I have found in every section of the country visited.

I am constantly impressed with the possibilities of this work before educational bodies and schools, and especially in institutions which are engaged in preparing teachers, editors, lawyers, clergymen and other leaders of public opinion for their life work. The popular distrust of the profession, ordinarily passive but ready to become active and to be utilized by the various quack and other antagonistic interests, can scarcely be overestimated, and probably can never be eradicated from the once infected adult mind. The experience of recent years has convinced me that with the aid of the teachers and schools, an aid which will be ours for the asking anywhere, a generation of voters and legislators can soon be so trained that the vast interests represented by preventive medicine will come to be appreciated as among the most important and cheaply and easily conserved of the nation's resources, the unselfish aims and purposes of the profession will be recognized and constructive statesmanship can be submitted for the time-serving political methods which have so long obtained in our public affairs, local, state and national. For these and other reasons which can not be enlarged on here, I would urge such an alliance between physicians and teachers in every section of the country as will make all that is involved in our work matters of common knowledge. In short, the future, as I see it, was never so full of promise, if the people can be frankly taken into our confidence and more sense and greater dignity can be made to obtain in our relations with the public and public affairs.

I have been especially encouraged during the year because new workers have been induced to enter the field and improve on the methods formerly adopted. Dr. Phillip Mills Jones, in addition to the great work that he has done for the people and profession of California, has successfully invaded adjacent jurisdictions, and it is hoped can devote at least a portion of his time in other states. Mrs. Bartlett Crane, a well-known club woman and civic worker of Michigan, has excited much interest in health reform in some of the cities of New England, Pennsylvania and Florida, and is just concluding a strenuous four weeks' itinerary in Kentucky. Mrs. Crane is the wife of one of our excellent members who is present at this meeting. She has had large experience as a civic worker, is tactful, practical and conservative in her methods, is an

orator who has the power to sway audiences at her will, and is such a natural good woman and wife with it all that, if she can devote one-half of each month to organization affairs, untold good will result.

I have had occasion in other reports to refer to the shrewd and insidious methods of the quack "patent-medicine" and low-grade proprietary people in antagonizing the advance work of the profession. In former years, the cities and towns where I had appointments were usually flooded with circulars making personal attacks on me, the trustees or the Association as a trust. Early this year, correspondence accidentally fell into our hands showing that these interests, recognizing that this desultory warfare had failed, were organizing a far-reaching conspiracy, with unlimited means back of it for a final, concentrated attack on their arch enemy, the one man who has done more than all others to expose their nefarious impositions on the profession and people, our friend, Dr. Simmons. They reasoned, wisely and truly, that if they could discredit and break him down no one succeeding him would ever be likely to make such a fight as he has done. With the foundation of this conspiracy, the distribution of literature at my meetings was discontinued and was only taken up again within the past month, when it became evident to all that the attack on Dr. Simmons had only rallied his friends the closer around him, making us like him the better for the class of enemies he has made. By reason of our intimate official and personal relations for eight years, I know this man as no other member can. It is not necessary for me to tell you that he is the greatest of living American editors. You know that. It is not necessary that I tell you that he is true to the core and has never had a thought, sleeping or waking, in all these years which was not full of loyalty to this Association and its vast interests. You know that. That he is worthy of our confidence as an officer and leader. You know all that. But I do ask you, just as he has emerged from an ordeal which has tried his heart, as it would have tried yours or mine, that you and each of you during this meeting give him such assurance of personal esteem as will give him nerve for the battles in which, God sparing his useful life, he is yet to lead us.

Report of the Committee on Scientific Research

The report of the Committee on Scientific Research was called for, and, in the absence of the chairman of that committee, was passed. The report as submitted by the committee follows:

To the Members of the House of Delegates of the American Medical Association:

On behalf of the Committee on Scientific Research, I would report that three grants of \$200 each have been paid during the past year: One to Dr. Isabel Herb of Chicago for a contribution entitled "A Study of the Etiology of Mumps;" a second to Dr. H. T. Ricketts of Chicago for a study entitled "An Investigation of the Identity of the Rocky Mountain Fever of Idaho with that found in Montana;" and a third to Dr. R. M. Pearce of New York for two papers entitled "A Study of the Elimination of Inorganic Salts in a Case of Chronic Universal Edema of Unknown Etiology with Apparent Recovery," and "A Comparative Study of the Physical Changes in the Blood in Relation to Opsonic and Phagocytic Indices and Cell Content Under Normal Conditions."

In addition to these a grant of \$200 was allowed Drs. D. J. McCarthy and M. K. Myers of Philadelphia for "An Experimental Study of Cerebral Thrombosis." A preliminary report of this work was read at the last meeting of the Association, but it has not been completed and the grant is, therefore, continued until final publication is made.

A grant was made to Dr. Carl Voegtlin of Baltimore for a study by himself and Dr. W. G. MacCallum "On the Relation of the Parathyroid to Calcium Metabolism and the Nature of Tetany." By some misunderstanding, this paper was published in the *Journal of Medical Research*, and was not, therefore, according to our rules, entitled to the grant from the Association. This work, however, was done under the impression that a grant would be given, and the committee would recommend that the grant be allowed in this instance. Hereafter, a form will be sent to all those asking for grants, which will clearly specify the rules under which grants are made.

For the year 1909 grants have been allowed as follows: Dr. Isabel Herb of Chicago, \$200; Dr. Holmes C. Jackson of Albany, N. Y., \$100; Dr. George B. Webb of Colorado Springs, \$100; Dr. H. T. Ricketts of Chicago, \$200; Dr. R. M. Pearce of New York, \$200; Dr. Carl Voegtlin of Baltimore, \$200; Dr.

D. J. McCarthy and Dr. M. K. Myers, \$200 (continued). A grant of \$50 was made to Mr. H. T. Glenn of Chicago for a piece of work on "The Comparative Disinfective Power of Chinisol, Carbolic Acid and Mercuric Chlorid." The results of this work have been used by the Council on Pharmacy and Chemistry of the Association.

Your committee has continued in its former policy of making grants to certain individuals and repeating these when the quality of the work has been such that continued support has been desirable. So many requests have been made by individuals worthy of support that it has not been necessary to advertise the existence of these grants as was done in the beginning. The amount allowed by the Association now barely covers the grants that have been made on solicitation of laboratory workers. Any advertisement would probably bring such a number of requests that the resources of the committee would be exhausted without satisfying all those who would make application.

We are fully convinced that the amount expended by the Association for the grants of the Committee on Scientific Research has been usefully employed, and that an increase of the yearly appropriation to \$1,000 would be judicious if this sum can be spared for the purpose.

ALFRED STENGEL, Chairman.

Report of the Board of Public Instruction on Medical Subjects

Dr. F. F. SIMPSON, Chairman, presented the report of the Board of Public Instruction on Medical Subjects, which was referred to the Board of Trustees.

To the Members of the House of Delegates of the American Medical Association:

In the inauguration of a plan of work which must ultimately, if successful, become very comprehensive, a primary experimental stage is inevitable. The Board of Public Instruction has passed through such a period during the last year, and several avenues which we hoped to employ for purposes of publicity have proved to be unavailable because of limitations which the Board could not accept. The various members of the Board, particularly the former secretary, Dr. Goepp, have interviewed many of the leading editors and managers of newspapers and popular journals. Very few are willing to accept matter without their editorial revision, which in many instances would tend to impart to the article a character more or less sensational. Again we find that each periodical insists on having the exclusive right of publication. At this stage of the work this is manifestly impossible, for it would require a bureau of a magnitude far beyond the possibilities of an available appropriation to furnish indiscriminately separate articles for the large number of papers that might require them. For the present, therefore, it is the plan of your Board to limit the work to a few subjects which have been carefully chosen. They are as follows: typhoid fever, diphtheria, variola, dysentery and gastroenteritis of infants (cholera infantum), cancer, ophthalmia neonatorum, malaria, meningitis, tetanus, rabies, cholera Asiatica, and yellow fever. These subjects have been chosen chiefly because they belong to the general infectious diseases which are, with one or two exceptions, more or less prevalent throughout the United States. While this series is in preparation, any subject which appears to be of more urgent importance may take precedence. The more pressing matters must have first attention. The limitations of our appropriation render it impossible to make the scope more comprehensive at present. In our initial work a large appropriation has not been essential, and we realize that with the constant demands on your treasury, your Board of Trustees has been very generous. Later, we hope within the present year, a point will be reached when a larger appropriation will be essential if the work is to be properly developed. As our material increases and a sufficient stock is in hand for constant draft by a newspaper agency syndicate, an appropriation sufficient to cover this outlay will be necessary. One of the largest newspaper syndicates has offered to distribute to 1,000 newspapers over the country one column weekly for \$1,800 a year. This appears to be a liberal rate, and we trust that we may be able, through a larger appropriation, to avail ourselves of this means of placing before the public articles of educational value. It is possible to secure an even better contract than this when the character of our work is recognized.

At first it was thought that many of the prominent members of the American Medical Association could be drafted for these popular articles, but the strenuous life of the average physician is such as to make it impossible for him to be an

active contributor. Besides it is difficult for the average medical writer to adapt his style to lay readers. For this reason your Board has adopted the policy of having the literature on each subject revised by an expert in the Surgeon-General's Library, and from this material a popular article is constructed by a writer versed in medical matters and adapted by a special literary training for putting it in a popular and attractive form. The Board feels that it has been particularly fortunate in securing the cooperation of Dr. Pfender in the collection of the literature, and of Mrs. Howard for editorial supervision. The latter has had a long training both in popular and medical writing, and has been until recently assistant editor of a medical weekly, and is, therefore, unusually well adapted for this particular work.

By resolution of the Board of Public Instruction, one representative from each state in the Union has been invited to cooperate with us as an Auxiliary Board. Each member is expected to keep in touch with matters requiring publicity, and to supervise in a general way the inauguration of publicity schemes in his own territory. Each article as completed will be put in pamphlet form and kept in stock in the Bureau of Public Instruction at the American Medical Association buildings in Chicago, and will be subject as necessary to draft by physicians all over the country. For instance, in the event of a local epidemic of typhoid fever or other infectious disease, these pamphlets may be at once dispatched to those districts and placed, through physicians and other channels of distribution, in the hands of the people. It is hoped that the Auxiliary Board may be of material assistance to the central Board of Public Instruction in indicating lines of work especially adapted for each district. This Board consists of the following members:

Drs. W. H. Sanders, Alabama; C. C. Stephenson, Arkansas; Philip Mills Jones, California; Melville Black, Colorado; Joseph H. Townsend, Connecticut; P. W. Tomlinson, Delaware; Charles W. Richardson, District of Columbia; J. Harvey Durkee, Florida; Floyd W. McRae, Georgia; J. M. Taylor, Idaho; Carl E. Black, Illinois; J. N. Hurty, Indiana; E. L. Stevens, Iowa; L. H. Munn, Kansas; George P. Sprague, Kentucky; Oscar Dowling, Louisiana; Louis P. Hamburger, Maryland; Benjamin R. Schenck, Michigan; Arthur Sweeney, Minnesota; P. W. Rowland, Mississippi; Walter B. Dorsett, Missouri; Donald Campbell, Montana; H. W. Orr, Nebraska; Irving A. Watson, New Hampshire; Alex. Marcy, New Jersey; Frank Van Fleet, New York; Albert Anderson, North Carolina; J. H. J. Upham, Ohio; A. K. West, Oklahoma; R. C. Coffey, Oregon; Charles H. Miner, Pennsylvania; T. P. Whaley, South Carolina; R. D. Alway, South Dakota; A. B. Cooke, Tennessee; David E. Fly, Texas; H. D. Niles, Utah; E. G. Williams, Virginia; Park Weed Willis, Washington; W. T. Sarles, Wisconsin.

This list is complete with the exception of a few states.

Cooperation of the state societies will also be essential to the proper execution of the plans of the Board of Public Instruction, for the problems of each state have more or less individual peculiarities which can be met only by these associations. Thus, the lecture courses which are being inaugurated in several states and cities can best be conducted by state and county societies. It is gratifying to note that already committees have been formed in various parts of the United States for this purpose. We anticipate that during the coming year further additions will be made to this list, and that a widespread movement may be inaugurated for the popularization of many subjects suitable for the education of the laity in matters pertaining to general health.

As noted in our previous report, all articles compiled by the Board of Public Instruction will appear as unsigned documents emanating from the authorized body of the American Medical Association.

Your Board is under obligations to Dr. Ferd C. Valentine for his excellent article entitled "The Boy's Venereal Peril," which has been in extensive demand and will now appear as a pamphlet authorized by this Board.

It is our fixed policy to avoid all controversial questions, and to publish matters on which there is a general consensus of opinion among the well-informed members of our profession. All therapeutic questions must be excluded from these articles, for the treatment of the patient belongs to the physician. The function of this Board is to assist the physician, by rendering more intelligible to the layman the general principles underlying the cause and prevention of disease.

In the event of the employment of a newspaper syndicate for distribution purposes, each article will be copyrighted, thus preventing editorial alterations after it leaves the Board of Public Instruction.

Your Board believes that gradually a successful policy may be evolved which will carry out the intent of the House of Delegates, but experience has taught that a scheme which has such a broad scope must be developed slowly if it is to be most successful.

Your Board has sustained during the year a serious loss in the death of Dr. Harrington. His connection with the Massachusetts State Board of Health and his experience in questions of public health rendered him a most valuable member, and we are indebted to him for many suggestions in the organization and lines this work shall take.

Respectfully submitted,

F. F. SIMPSON,
FRANK BILLINGS,
L. S. McMURTRY,
HOWARD A. KELLY,
GEORGE W. CRILE,
MYLES STANDISH,
JOHN G. CLARK, Chairman.

Report of the Committee on Nomenclature and Classification of Diseases

The report of the Committee on Nomenclature and Classification of Diseases was called for, and, in the absence of the chairman, was passed. The report as submitted by the committee follows:

To the Members of the House of Delegates of the American Medical Association:

Your Committee on Nomenclature and Classification of Diseases have the honor to present the following report of the work done by them, in collaboration with representatives of the cooperating bodies, since the Chicago meeting of the Association, held in the year 1908:

Soon after that meeting it became apparent that an exigency not at first known—that of the change of the time of assemblage of the International Commission for the Revision of the International Classification of Causes of Death, from 1910 to 1909—required that your committee should give early attention to the matter of classification, postponing for the time being that of nomenclature. Accordingly due notice was given of a meeting to be held in Philadelphia, beginning on September 24. At that meeting, which occupied two entire days, there were present two members of your committee (Dr. Dorland and the chairman); Dr. Cressy L. Wilbur of Washington, representing the Bureau of the Census; Dr. J. M. Eager of Washington, representing the Public Health and Marine Hospital Service; Dr. M. Howard Fussell of Philadelphia, representing the Section of Medica and Therapeutics of the American Medical Association; Dr. E. E. Montgomery of Philadelphia, representing the Section of Obstetrics and Diseases of Women of the American Medical Association; Dr. Henry W. Cattell of Philadelphia and Dr. Walter McNab of Columbia, Mo., representing the American Academy of Medicine; Dr. Wilmer R. Batt of Harrisburg, Pa., and Dr. William H. Guilfoyle of New York, representing the American Public Health Association; Dr. Francis D. Donoghue of Boston, representing the American Association of Medical Examiners; Dr. John M. Swan of Philadelphia, representing the American Society of Tropical Medicine, and Dr. Warren Coleman of New York, representing the Committee on Clinical Records of Bellevue and allied hospitals, New York. These gentlemen were very courteously invited by Dr. Batt to take part in the proceedings of a meeting of the committee of the American Public Health Association, of which he was chairman, to be held in Washington during the following week, and several of them did attend that meeting. Among them was the chairman of your committee. The result of the conferences held in Philadelphia and Washington was the preparation (finally put into shape by Dr. Wilbur) of the following:

STATEMENT OF SPECIFIC RECOMMENDATIONS OF THE COMMITTEE ON NOMENCLATURE, ETC., OF THE AMERICAN MEDICAL ASSOCIATION, WITH SPECIAL SECTION COMMITTEES AND ASSOCIATED COMMITTEES, THE COMMITTEE OF THE VITAL STATISTICS SECTION OF THE AMERICAN PUBLIC HEALTH ASSOCIATION AND COOPERATING FEDERAL SERVICES, RELATING TO THE REVISION OF THE INTERNATIONAL CLASSIFICATION OF CAUSES OF DEATH.

TITLE.

I. A. Change "Epidemic Diseases" to Infective Diseases.
9. Change title to Diphtheria (including croup). *Note.*—The word "croup" should be disused; with its disappearance the title should become simply diphtheria.

13. Transfer to 105 and 106.

14. Divide title into amebic dysentery, bacillary dysentery and dysentery (undefined). Change "Chinese dysentery" to Cochin China diarrhoea and transfer to 105 and 106.

15. Make title Plague and add pestis minor, pneumonic plague and septichæmic plague.

19. Change title to Other Infectious Diseases. Add sleeping sickness, hemoglobinuric fever (blackwater fever), yaws, Malta fever, foot and mouth disease, and Madura foot.

20. Include all septichæmia except puerperal and divide into traumatic and other and undefined.

24. Separate actinomycosis and trichinosis.

26. Include under 27.

26-33. The word tuberculous should be restricted to the specific disease tuberculosis, and the word tubercular should be discarded in this connection.

31. Change title to Tuberculous Abscess.

35. Transfer "Lymphatism" to 55. Drop "Scrofula" as a title and compile under 33.

26-35. Proposed rearrangement of tuberculosis:

New Titles.

Include Old Titles.

Total Tuberculosis. Tuberculosis (all forms), "scrofula."

Hæmorrhage of lungs.

Tuberculosis of lungs (27).

Tuberculosis of larynx (26).

Hæmorrhage of lungs (part of 99).

General tuberculosis (34).

Tuberculosis of Lungs.

Acute miliary tuberculosis

Tuberculous Meningitis.

Abdominal Tuberculosis.

Tuberculosis of meninges (28).

Abdominal tuberculosis (29).

Pott's disease (30).

Cold abscess, "abscess by congestion" (31).

White swelling (32).

Tuberculosis of other organs (33).

"Scrofula" (35).

39-44. The line of demarcation between a cancer of the face (44) and a cancer of the mouth (39) should be taken as at the junction of the skin and mucous membrane.

39-45. In reporting cancer the point where the growth originated, or the primary site, should be given for purposes of classification.

39-46. Specify, if possible, the variety of neoplasm. All neoplasms, of whatever part of the body, should be placed together (not necessarily under a single title). Proposed rearrangement of neoplasms: New growths (malignant)—Carcinoma, Sarcoma, "Cancer" and malignant diseases not otherwise defined. New growths (nonmalignant or undefined)—Uterine Tumor, Ovarian Tumor, "Tumor" and other nonmalignant new growths not otherwise defined.

50. Transfer diabetes insipidus to 121.

51. Transfer exophthalmic goitre to 89 (new grouping thereunder). Change "Exophthalmia" to exophthalmos and transfer to 75.

52. Transfer title to 89 (new grouping thereunder).

53-54. Combine titles, perhaps as Diseases of the Blood. Include infantile pseudoleuchæmia.

53. Transfer Hodgkin's disease to 84.

55. Add dystrophia genitalis (Rummo's disease).

59. Add lathyrism and tobacco poisoning.

61a. Transfer to General (infective) Diseases. Definition and distinction from other forms (a committee on definitions provided for).

PROPOSED LIST OF UNDESIRABLE TERMS

NOTE.—As a result of the conferences between the General Committee of the American Medical Association and other committees, etc., it was agreed:

"That practical suggestions be framed relative to the reporting of causes of death and of sickness by physicians, and that a list of the most undesirable terms frequently employed be brought to their attention with the recommendation that they be disused."

The following terms are suggested as properly belonging to such a list, and, if approved by the General Committee, they can then be submitted to the other committees interested so that a list of undesirable terms can be distributed to the physicians of the country with the full approval of their national organizations. Other undesirable terms will probably occur.

Undesirable Term

Reason Why Undesirable

Abscess.

The location of the abscess should always be stated, and its nature, if known.

Accident, Injury, violence.

(unqualified.)

In all deaths resulting from violence the physician or coroner should see that the means of death, e.g., railway collision, gunshot, drowning, poison (name of poi-

Undesirable Term

Reason Why Undesirable

son). etc., is clearly indicated, and also whether the death was due to accident, suicide, or homicide, if possible to ascertain.

Atrophy, Debility, Decline, Inanition, Weakness, and other vague terms.

If dependent on a definite cause, the cause should be stated, or if the cause can not be ascertained, the words "cause unknown" should be added so that it will be known that the deaths should not be properly charged to tuberculosis or other disease resulting in debility, etc.

Congestion.

This word is not used in the London Nomenclature except in connection with cholera, kidney, lung, optic disc, and spleen. Of these only "congestion of kidneys" and "congestion of lungs" are frequently found on certificates of death. For the first, "656. Congestion [of kidney] (in diseases of heart and lungs)," the disease of the heart or of the lungs to which the congestion of the kidneys was secondary need alone be named; so also for "410. *Congestion [of the lungs]." But in practice "congestion of lungs" is frequently used to designate lobar or bronchopneumonia, acute bronchitis, etc., or it may be equivalent to pulmonary apoplexy. All "congestions," and the old "congestive chills," etc., are undesirable because of their indefinite use. "Congestion of bowels" is a not infrequent return.

Convulsions.

"It is hoped [but, apparently, in vain] that this indefinite term will henceforth be restricted to those cases in which the true cause of that symptom cannot be ascertained. At present more than eleven per cent. of the total deaths of infants under one year old are referred to 'convulsions' merely."—Reg.-Gen.

Croup.

Dropped in third edition (1896) of London Nomenclature. Note in fourth edition (1906) says: "The use of the term 'membranous croup' as a synonym for 'laryngeal diphtheria' should be discontinued." It is even more desirable that the unqualified term "croup" should cease to be so used. Even "spasmodic croup" is no longer given as a synonym of laryngismus stridulus as in the third edition. "Croup" is a most pernicious term from a public health point of view, and should be entirely disused.

Dropsy.

"Dropsy should never be returned as the cause of death without particulars as to its probable origin, e.g., in disease of the heart, liver, kidneys, etc."—Reg.-Gen.

Heart Disease, Organic Heart Trouble, etc. (nature not stated).

Vague statements of "heart disease," "heart trouble," etc., should not be given when the precise nature of the affection can be stated. Returns of valvular heart disease, or more specifically, mitral regurgitation, aortic stenosis, etc., are preferable. Always state congenital malformation of heart so that deaths of children from this cause may be separated from those due to acquired heart disease.

Heart Failure, Cardiac weakness, etc.

Such indefinite terms implying mere terminal conditions or symptoms should be entirely discarded in making out certificates of cause of death; if actual disease of the heart was present it should be definitely stated.

Hæmorrhage, Hemoptysis.

The cause should be given if known; it is especially important that deaths from tuberculosis of the lungs should not be reported as due merely to "hæmorrhage" or "hæmorrhage of lungs." But if nothing further than "hæmorrhage" can be stated, the organ or part affected should be named.

Hydrocephalus (unqualified).

"It is desirable that deaths from hydrocephalus of tuberculous origin should be definitely assigned in the certificate to 'Tuberculous meningitis,' so as to distinguish them from deaths caused by simple inflammation or other disease of the brain or its membranes. 'Congenital hydrocephalus' should always be returned as such."—Reg.-Gen.

Marasmus.

Not in English Nomenclature: "Marasmus, Term no longer used." (Second ed., 1885.) Is compiled under ill-defined by

Undesirable Term.	Reason Why Undesirable	Undesirable Term	Reason Why Undesirable
	International Classification; also by Registrar-General. Is often used to cover deaths from tuberculosis, syphilis, etc. See letter attached and reply.	Typhoid Pneumonia.	"The term 'typhoid pneumonia' should never be employed, as it may mean either enteric fever with pulmonary complications, on the one hand, or pneumonia with so-called typhoid symptoms on the other."—Reg.-Gen.
Meningitis, Cerebral Meningitis, Cerebrospinal Meningitis.	The specific disease known as "epidemic cerebrospinal meningitis" should be reported as epidemic cerebrospinal meningitis or cerebrospinal fever, whether the particular case happens to be among others in an "epidemic" or is merely sporadic; and it should be reported in no other way. Particularly the qualification "epidemic" should never be omitted, if the first form of return is employed, even if only a single case occurs. On the other hand it will be well to qualify all other forms of meningitis as "simple" or "not epidemic," so that the correct statistics of cerebrospinal fever can be obtained. Tuberculous meningitis should always be definitely stated as such. It is not necessary to mention merely symptomatic meningitis at all.	PROPOSED INCLUSIONS.	
Operation, Surgical. Operation, Surgical Shock.	The cause for which the operation was undertaken should be given unless the surgeon desires his work to be held primarily responsible for the death.	Cerebrospinal Fever.—Includes epidemic cerebrospinal meningitis, cerebrospinal meningitis, acute cerebrospinal meningitis, cerebrospinal arachnitis, cerebrospinal arachnoiditis, cerebrospinal inflammation and spotted fever.	
Paralysis (unqualified).	The vague use of this word should be avoided, and the precise form stated, as acute ascending paralysis, paralysis agitans, bulbar paralysis etc. Write general paralysis of the insane or general paresis in full, not "general paralysis" or "paresis." Distinguish paraplegia and hemiplegia, and in the latter, when the condition is a symptom or sequel of apoplexy or cerebral hemorrhage, report the death as due to cerebral hemorrhage.	Do not include acute meningitis, arachnitis, cerebral meningitis, leptomeningitis, meningeal inflammation, periencephalitis, septic meningitis, spinal meningitis, spinal fever, suppurative meningitis, catarrhal meningitis, cerebrocervical meningitis, chronic cerebrospinal meningitis and other chronic forms, congenital meningitis, congestive meningitis, diffuse meningitis, encephalomeningitis, hydromeningitis, idiopathic meningitis, infantile meningitis, inflammation of meninges, membranous meningitis, meningitis of spinal cord, meningocerebritis, metastatic meningitis, posterior meningitis, pneumococcal meningitis, progressive meningitis, purulent meningitis, Rocky Mountain spotted fever, serous meningitis, simple cerebral meningitis, simple cerebrospinal meningitis, subacute meningitis, or plain meningitis (unqualified). Of course, if a death is specified as due to tuberculous meningitis or any other definite form or as traumatic, following typhoid fever, etc., it would not be included either here or under "simple meningitis."	
Peritonitis (unqualified).	"Whenever this condition occurs—either as a consequence of hernia, perforating ulcer of the stomach or bowel, appendicitis, or metritis (puerperal or otherwise) or else as an extension of morbid processes from other organs, the fact should be mentioned in the certificate. At present far less than half of the deaths originally returned as from 'peritonitis' are found on inquiry to be instances of the idiopathic form of that disease."—Reg.-Gen. Traumatic peritonitis should specify nature of violence.	63. Change title to Other Diseases of the Spinal Cord, Pons and Medulla. Change "syringomyelitis" to syringomyelia. Transfer pseudohypertrophic paralysis and fatty degeneration of muscles to 149.	
Pneumonia (unqualified).	Many deaths returned from "pneumonia" are in reality due to bronchopneumonia, a distinct title of the International Classification. Hence it is desirable that deaths should be definitely specified as due to lobar pneumonia or to bronchopneumonia.	64. Change title, "Congestion and Hemorrhage of the Brain," to Cerebral Hemorrhage, Apoplexy.	
Pyemia, Septicemia.	If due to childbirth or abortion always write puerperal pyemia, puerperal septicemia, etc. If traumatic, state means of injury and whether accidental, suicidal, or homicidal.	67. Transfer general alcoholic paralysis to 56. Change title to General Paresis.	
Tabes mesenterica.	Dropped in the second edition. English Nomenclature. "The use of this term to describe tuberculous disease of the peritoneum or intestines should be discontinued, as it is frequently used to denote various other wasting diseases which are not tuberculous. 'Tuberculous peritonitis' is the better term to employ when the condition is due to tubercle."—Registrar-General's "Suggestions to Medical Practitioners respecting Certificates of Cause of Death."	68. Transfer priapism to 126.	
Tuberculosis (unqualified).	The organ or part of the body affected should always be stated, as tuberculosis of lungs, tuberculosis of spine, tuberculous meningitis, etc.	70-71. Transfer these titles to class of Ill-Defined Diseases.	
Tumor, Cancer (unqualified).	The kind of neoplasm, as carcinoma, sarcoma, fibroma, epithelioma, etc., should always be stated if possible and the organ or part of the body affected (first affected, if known). The word "tumor," without further qualification, is less definite than "cancer," and it should always be stated whether it was a malignant "tumor" or a benign "tumor." "Whenever a tumor is known to be due to Malignant Disease, to Tubercle, or to Syphilis, the fact should be stated in the certificate."—Reg.-Gen.	72. Transfer tetanus to General Diseases and distinguish traumatic tetanus.	

117. Distinguish: (a) Acute pancreatitis, (b) chronic pancreatitis and (c) other diseases of the pancreas.

118. Should precede 109.

120. Change title to chronic nephritis: (a) Chronic parenchymatous nephritis, (b) chronic interstitial nephritis and (c) chronic nephritis (undefined).

121. Add albumosuria, lithuria, oxaluria, phosphaturia, cystinuria, melanuria, alkaptonuria, hematuria, hematuria and lacelluria.

126. Add impotence, abscess of penis and ulcer of penis.

128. Do not include puerperal hæmorrhage or hæmorrhage of pregnancy.

130. Add uterine fistula (not urinary, 124; not fecal, 109). Change "peruterine" to perimetritic. Add atrophy of uterus (nonpuerperal). Do not include pelvic peritonitis (116), subinvolution of uterus (140), or uterine fistula (if urinary, 124); if, fecal, (109).

133. Include diseases of the male breast.

136. Transfer placenta prævia (unavoidable hæmorrhage) and separation of placenta (accidental hæmorrhage) to 135. Change title to Other Complications and Sequelæ of Labor.

137. Transfer title to General Diseases.

140. Abolish title and include terms under 136.

142. Abolish title and transfer terms included to cause or organ or part of body affected. Transfer Raynaud's disease to 81. Transfer dry gangrene to 81. Transfer gangrene of penis to 126.

143. Transfer title to General (infective) Diseases.

144. Transfer suppurative adenitis (bubo) to 84.

145. Transfer elephantiasis to 84. Do not include carbuncle, furunculosis, tropical phagedæna, bed sore, or frostbite (170). Add gangrene of skin.

146. Add chronic hypertrophic pulmonary osteoarthropathy. Transfer to 87: Diseases of accessory sinuses (frontal ethmoidal, sphenoidal, maxillary), sinusitis, empyema of sinuses, nonmalignant new growths of sinuses, parasites of sinuses, and foreign bodies in sinuses. Transfer mastoiditis to 76. Transfer rickets to General Diseases.

149. Add trigger finger, hammer toe and talipes (various forms) not congenital.

150. The word "congenital" should govern assignment to this title regardless of age, provided the death or morbidity was due to congenital malformation. Any malformation acquired after birth should not be included. Malformations acquired during fetal life as a result of antenatal disease should be included under congenital malformations, not under the diseases by which they were caused. Include the entire list of malformations of the London Nomenclature. Add congenital stenosis of aorta, congenital stenosis of intestine and congenital stenosis of pylorus. Add congenital idiocy and congenital imbecility.

152. Add disease of placenta (as affecting infants under three months of age).

153. Abolish title and include under 173.

164-165. Fractures and dislocations should be referred to the cause of injury (in general mortality statistics).

167. Add effects of light, x-rays and radium.

167-169-174. Rearrange.

174. Include all deaths from anesthetics (gases or vapors) under this title, with subdivisions showing causes for which operations were undertaken. Add poisoning by sewer gas, aniline, cacodyl, sulphurous acid, sulphuretted hydrogen, benzene, carbon disulphide, ether and methyl alcohol fumes (as in shellac vats).

175. Add poisoning by methyl alcohol and ptomain poisoning.

174-175. Include the entire list of poisons, both gases and vapors, of the London Nomenclature (174-175).

176. Deaths from electrical currents (live wires) should be separately stated. Include injuries at birth. Make criminal abortion a separate subdivision of homicide. Make a separate division for wounds in action (battle).

166-176. Combine these titles and rearrange entire class, avoiding cross classification by nature of injury instead of mode of injury.

DRAFT OF PROPOSED ARRANGEMENT OF VIOLENT DEATHS

Class XIII.—Violence

A.—Accidental or undefined.

Conflagration (and injuries resulting therefrom).

Burns and scalds (not from conflagration, railroad accidents, or other classified accidents).

Acute Poisoning (English list)—

Poisonous gases and vapors (not conflagration).

Surgical anesthetics (details, with cause of operation).

Illuminating gas. Other gas poisoning.

Other poisons (not gaseous, chronic, or occupational).

Food poisons (ptomaines).

Other poisons listed (including corrosive poisons).

Industrial Injuries—

Machinery in factories, etc. (Nature listed).

Elevators.

Building operations.

Mines and quarries (stated separately as needed).

Transportation Agencies—

Steam railroads.

Electric roads (extraurban).

Street railways.

Automobiles.

Aeroplanes, balloons, etc.

Other vehicles, horses.

Electricity (not lightning or otherwise classified).

Falls.

Gunshot.

Drowning.

Suffocation (not including drowning, conflagration, poisonous gases, or mining accidents).

Overlying.

Foreign bodies in air passages, etc.

Injuries at birth.

Weather, Seismic Agencies—

Heat and sunstroke (subdivisions in special tables), heat exhaustion, etc.

Cold, frostbite, freezing.

Lightning.

Cyclone, tornado, earthquake, etc.

Other and Ill Defined Violence—

Starvation, exposure, thirst.

Fractures and dislocations (cause not specified).

Wound, injury, etc. (cause not specified).

Surgical operation (cause not specified), or compile under Class XIV as at present.

Other and ill defined violence.

B.—Homicidal.

Criminal abortion.

Other homicides.

C.—Suicidal. (Subdivisions by means of suicide in special tables.)

D.—Judicial. (To be omitted if not legal executions).

E.—War. (To be omitted except when required. Separate statement of "in action.")

An alternative list should be employed for hospital statistics, in order to present data concerning the nature of the injury. The list given in the London Nomenclature, with the changes hereinafter mentioned, is recommended for the purpose.

As regards the matter of nomenclature proper, which has thus far figured in only an incidental and fragmentary way in this report, the members of your committee understand that the American Medical Association has expected them to deal chiefly with the fourth edition (third revision, published in 1906) of the Nomenclature of Diseases Drawn Up by a Joint Committee Appointed by the Royal College of Physicians of London, which for the sake of convenience is herein referred to as the London Nomenclature. Nevertheless, so far as opportunity has offered, they have studied several other nomenclatures, including the publications of the government medical services and that of the trustees of Bellevue and allied hospitals, of New York.

Though your committee regard the London Nomenclature as in the main an admirable work, they think it has some defects requiring correction, and that certain additions should be made to it. The diseases enumerated in its major list are numbered consecutively from 1 to 1,244. It is evident that such a system of numbering is at once thrown into disorder by any change in the lists, whether by adding or dropping titles or by their transposition; and such changes must be made from time to time in any nomenclature which is to continue to represent medical knowledge and opinion. Some arrangement analogous to the extension system now generally adopted in numbering books in public libraries therefore seems to be desirable. A member of your committee, Dr. Duane, has devised such a scheme, and your committee recommend its adoption so far as may prove practicable—that is, in the case of all diseases the nature of which is known.

According to Dr. Duane's plan all titles would bear a title letter referring to an explanatory list and denoting the general nature of the morbid condition. Thus, a title marked A would always stand for an infective disease; one marked B for a parasitic affection; one marked I for an inflammation, etc. The titles might also bear a species number following the title

letter and indicating the special nature of the morbid condition. Thus, A75 would always denote leprosy, C15 diabetes, D2 lead poisoning, H2 hyperemia, etc. Titles indicating conditions which, for purpose of either provisional enumeration or permanent classification, are regarded as local would bear a section number preceding the title letter and referring to another explanatory list. Thus, a title beginning with 1 always means a disease of the nerves, one beginning with 10 a disease of the conjunctiva, etc. So also 1A necessarily means an infectious disease of the nerves, and 1A75 leprosy of the nerves. The form 1D means a toxic condition of the nerves and 1D2 lead poisoning of the nerves. The form 10E denotes some diathetic affection of the conjunctiva, 10E26 gout of the conjunctiva, 10I conjunctivitis, 10I1 catarrhal conjunctivitis, etc. Such a scheme is, of course, largely a matter for editorial treatment in the preparation of any publication which the Association may decide to issue with regard to this subject.

Your committee recommend that in all names of diseases involving anatomical terms the nomenclature adopted by the German Anatomical Society, generally known as the *Basel'sche Nomina Anatomica* (B N A), be adhered to. While we do not assert that that nomenclature is faultless, we believe that it is far superior to anything of the sort that has been proposed before, and we realize that it is sure to be employed extensively in textbooks of anatomy. It involves the retention of all diphthongs in Latin words, though not in form of ligatures. The London Nomenclature gives the diphthongs in separate letters in its Latin list but as ligatures in its English list. We recommend printing them all in separate letters, but in the English list it seems proper to make a concession to those who look on certain Latin words as "Anglicized"—who, for example, write anemia instead of anæmia and diarrhea instead of diarrhœa. In such words we propose to inclose the first letter of the diphthong in parenthesis marks—thus, an(a)emia and diarrh(o)ea. Adherence to the *Basel'sche Nomina Anatomica* requires also the substitution of thyreoid for thyroid, chorioid for choroid, Falloppian for Fallopian, etc. In the interest of uniformity we recommend that such substitution be made. We also recommend certain spellings which, though now uncommon, have received dictionary recognition in the past and are made prominent in the London Nomenclature, such as leuchæmia and septichæmia instead of lucæmia and septicæmia. We believe that no other spelling is defensible.

We recommend that all Latin adjectives, even those derived from proper names, be written with a small initial letter, e. g., cholera asiatica (not Asiatica), also that the circumflex accent (being a mere schoolboy's aid) be omitted from ablatives of the first declension and genitives of the fourth declension.

We recommend that the word inflammatio occurring under a class heading hinging on the name of an organ or part be omitted whenever an equivalent term ending in itis occurs.

We also recommend the following specific changes:

Pp. 2-3.—Transpose febris enterica and febris typhoides, also enteric fever and typhoid fever, making typhoid fever the recognized name and enteric fever a synonym.

P. 4.—Change parotitis to parotiditis.

Pp. 50-51.—Change myosis to meiosis.

P. 68.—Change eniocularis to uniocularis.

Passim.—Change coartatio to coarctatio.

P. 123.—Change Riggs's to Riggs's.

Passim.—Change læsiones to traumata.

Pp. 128-129.—Change tonsillitis to amygdalitis.

P. 148.—Transpose rectocece and proctocece.

P. 176.—Change morbus Bright to nephritis.

P. 192.—Change preputii to præputii.

P. 222.—Omit obstantia.

Passim.—Change distensio to distentio. Change perineum to perinaeum.

P. 238.—Change mamillæ to mamilla.

P. 242.—Change fracture (sic) non solidata to fractura perstans. Change rachitis to rhachitis.

P. 252.—Change trichinosis to trichiniasis.

P. 270.—Change tinea versicolor to pityriasis versicolor and pediculosis to phtheiiasis.

P. 277.—Change overlaying to overlying.

P. 278.—Change ex tormentorum pilis to scolopeticum.

P. 284.—Omit title 1063.

P. 286.—Change aponeurosim to aponeurosin.

P. 316.—Change ununitid to persistent.

P. 320.—Change frænum to frenum.

P. 324.—Change empyemic to empyematous and omit trans thoracic.

P. 325.—Add appendicostomy.

P. 330.—Under "removal of whole cervix uteri" omit the inaccurate synonym. Add colpocleisis.

P. 332.—Change pregnant to gravid. Add operation for ectopic gestation.

P. 342.—Change renum to renis.

P. 356.—Change perincalis to perinealis.

P. 358.—Omit "radius aut."

Pp. 360-361.—Change Gärtner to Gartner.

P. 364.—Change cranium . . . redactum to crania . . . redacta. Change medulla spinalis . . . redacta to medullæ spinales . . . redactæ.

P. 374.—Change venosum to venenosum.

P. 376.—Change Hamburyi to Hanburyi.

P. 385.—Change spirochæta to spirochæta.

P. 391.—Change fly Tsetse to Tsetse fly.

The changes thus far recommended are based on a careful study of all the suggestions received from the cooperating bodies, and they were approved of at a meeting held in New York on April 1, 1909, at which meeting there were present Dr. Wilbur, Dr. Batt, Dr. Cattrell, Dr. Meyer, Dr. Coleman, Dr. Guilfooy and the chairman of your committee. At that meeting it was resolved to recommend the following additional titles:

Paratyphoid (pseudotyphoid) fever.

African tick fever.

Tropical bobo.

Hill diarrhœa.

Epidemic gangrenous proctitis.

Japanese river fever (Shima mushi).

Nasha fever.

Acute febrile jaundice (Weil's disease).

Granular fever.

Mountain fever.

Rocky Mountain tick fever (black fever, spotted fever of the Rocky Mountains).

Coccidioidal granuloma.

Psittacosis.

Milk sickness (trembles, slows).

Polycythæmia.

Cardiac arrhythmia.

Heart block.

Achylia gastrica.

Asthenic bulbar paralysis.

It is realized by your committee that there will doubtless have to be many more additions as our knowledge advances, especially of names of tropical diseases.

The changes thus far recommended are based on a careful consideration of the London Nomenclature and of the suggestions made by the organizations cooperating with your committee so far as they have been received up to the meeting of April 1, 1909, and all those cooperating bodies had had ample notice that all their suggestions must be in the hands of your committee by that time. We did receive certain suggestions, and we acted on them at that meeting. We have since received several proposed rearrangements of the name of diseases and injuries encountered by specialists, but there is not now sufficient time remaining to enable us to digest them and assimilate them with the work previously done. We can do nothing, therefore, but submit them with this report as "exhibits," remarking that they have our general approval. They are as follows:

Psychiatry.—The report of the committee of the American Psychological Association, prepared by Dr. Adolf Meyer, with the collaboration of Dr. Henry M. Maudsley and Dr. C. B. Burr—marked Exhibit A.

Stomatology.—The report of the committee of the Section on Stomatology, Dr. George V. I. Brown, chairman—marked Exhibit B.

Laryngology, Otology and Rhinology.—Joint reports of the committees of the Section on Laryngology and Otology, Dr. D. Braden Kyle, chairman, the American Laryngological Association, and the American Triological Society—marked Exhibits C, D and E. In a letter dated April 12, 1909, addressed to the chairman of your committee, Dr. Kyle says: "The report which I submitted to you is the one made by a committee consisting of Dr. James F. McKernon, Dr. A. Coolidge, Jr., and myself as chairman. This committee represents, as I understand it, the Section of Otology and Laryngology of the American Medical Association, the Laryngological Association, and the American Triological Society, as the same committee was appointed by each society. The subdivision of the work was merely made for the convenience of the committee, so that the report as sent to you is the report of the nomenclature of the throat, nose and ear. My committee has to report to the American Laryngological and also the Triological at their annual meeting in June, so we have no right to send that re-

port to you until sanctioned by the council of the society, and therefore this report which you have is really from the Section on Otology and Laryngology of the American Medical Association; but the same report will be made to the other two societies."

Ophthalmology.—A scheme prepared by Dr. Alexander Duane, a member of your committee—marked Exhibit F.

In addition, we submit herewith the revised statistical report employed by the Naval Medical Corps (marked Exhibit G) and galley proofs of the revised Bellevue Hospital Nomenclature of Diseases and Conditions, not yet published in book form (marked Exhibit H).

If the general plan of the London Nomenclature is adhered to, the columns of French and German equivalents being retained, a rather bulky book will have to be published, but it does seem of advantage to retain the Latin and English columns. It will be noticed that the navy list is entirely in Latin, whereas the Bellevue list is almost wholly in English. It seems to us that a book conveniently small and yet comprehensive enough for all ordinary purposes might be made by combining the naval and Bellevue lists, with such modifications as may be found requisite.

To this report will be found appended a proposed list of undesirable terms (sometimes used in death certificates), drawn up by Dr. Wilbur with the approval of the Philadelphia meeting of your committee.

Among the matters with which your committee was charged was that of assisting in making provision for an American delegation to the Paris conference for revising the International Classification of Causes of Death. That matter seems to be in the hands of the United States government, at the invitation of the government of France, and your committee are not aware that any steps have yet been taken by Congress to provide for a delegation.

It will be seen that this second report of your committee is only tentative, for it seems to us that no complete nomenclature and classification of diseases and injuries can properly be prepared until the conclusions arrived at by the Paris conference are published.

The thanks of your committee are due to Dr. Cressy L. Wilbur for continual and most valuable assistance in their work—assistance made all the more efficient by his experience as chief statistician of the Bureau of Census; also to Dr. John M. Swan, of the American Society of Tropical Medicine, for his services as secretary and otherwise at our Philadelphia meeting, and to the Polyclinic Hospital of Philadelphia for providing a room for that meeting.

Respectfully submitted,

FRANK P. FOSTER, Chairman.

DR. ALEXANDER R. CRAIG, Pennsylvania: I move that the reports of the Committee on Scientific Research and the Committee on Nomenclature and Classification of Diseases be accepted as printed, but that the report of the Committee on Scientific Research be referred to the Board of Trustees, inasmuch as it involves the appropriation of money.

Seconded and carried.

Report of the Committee on Patents and Trade-Marks

DR. CHARLES S. BACON, Illinois, Chairman, read the report of the Committee on Patents and Trade-Marks, which was referred to the Reference Committee on Legislation and Political Action.

To the Members of the House of Delegates of the American Medical Association:

Your committee was created at the Chicago meeting by the action of the House of Delegates in adopting the following resolution:—

WHEREAS, The object of the patent laws is to promote progress in science and useful arts; and

WHEREAS, The application of the United States patent law to materia medica inventions and discoveries is a hindrance to progress in therapeutics, because patents on products are allowed, thus creating monopoly and preventing progress and improvement in the art; and

WHEREAS, Foreign countries, including Germany, France, Austria-Hungary, Italy, Japan, Argentina, etc., prohibit the patenting of materia medica products; and

WHEREAS, A patent on a product creates a monopoly not only on the product itself, but on all subsequent improvements in processes for making the same, thereby destroying the stimulus for improvement and discovery through research; and

WHEREAS, The registration of the name of medicines as trade-marks creates and fosters fraud, and causes confusion in the business in drugs by misleading advertisements, to the injury of the public health; therefore, be it

Resolved, That a committee of five appointed by the House of Delegates to work with the Council on Pharmacy and Chemistry and committees of other societies created for a like purpose to study

the whole question and cooperate with the Committee on Medical Legislation in preparing and securing the enactment of a bill which shall secure such modification of the patent and trade-mark laws as will correct the abuses stated in these resolutions.

The committee has made a study of the work previously done in this line by the American Pharmaceutical Association. It has also investigated the patent and trade-mark laws of the United States and foreign countries and conferred with about fifty of the leading drug manufacturers of this country in regard to the effect of the proposed changes in the laws.

While some manufacturers contest the proposition that a patent on materia medica products is a hindrance to progress, others admit its truth. The chief objection to the proposed limitation of patents to processes of manufacture does not so much involve the patent laws as the general system of jurisprudence. In foreign countries which have only process patents, an alleged infringer is required to prove that he is not using a patented process. The opposite rule of procedure, throwing the burden of proof on the plaintiff, is at the basis of legal practice in this country, and a change in our system is out of the question.

In the event that patents on products, as distinguished from patents on the process by which the products are manufactured, were done away with the difficulties under our system of law of proving affirmatively the use by the alleged-infringer of the patented process are so great that the value of process patents would be practically destroyed. The presumption obtains generally under our system that proof of guilt or of the infringement must always be made by the person alleging it, rather than that the accused must first establish his innocence. It is comparatively a simple matter to prove infringement of a mechanical patent, because a machine can be seen, described and its mechanical functions easily understood; but in the case of chemical processes practically the only way of proving the use of any patented process is by the evidence of a man who has actually performed it. The result is that to prove an infringement of a process patent it is usually necessary for the plaintiff either to subsidize some of the alleged infringer's employees, or to put confederates in his factory, neither of which courses is commendable. The result of doing away with product patents would undoubtedly be that manufacturers would preserve their formulas as trade secrets and would not disclose them. This would result in a monopoly not limited by any particular period of time, but which would exist as long as the formula remained undisclosed, and this, of course, would result in all of the disadvantages and dangers consequent upon secret formulas.

We therefore conclude that such a change in the patent laws as suggested in the resolution is impracticable. We believe, however, that it may be possible to improve the situation by certain changes, perhaps such as would be in line with those recently adopted in England, restricting patents to articles manufactured solely or chiefly in the country. We learn that changes in the patent laws in other directions are being considered by other organizations, for example, by the American Bar Association, and we would recommend that the association continue a committee to keep track of legislation on this subject and to cooperate with bodies interested in the improvement of medicine and drug patents.

In regard to the evils arising from the registration of names as trade-marks we have come to the conclusion that these evils are to be remedied by the courts rather than by the enactment of new laws. It is a fundamental proposition that the registration of a trade-mark or name creates no new rights. The property right in a mark, which simply denotes origin, exists just as well when there is no registration of the mark as after such registration is made. Certain rules regarding the registration of names of medicines are definitely established by the courts and by the Commissioner of Patents. The name of a medicine which is the subject of a patent can not be registered as a trade-mark, and neither can a name which is descriptive of the article, its qualities or purposes, or which is false.

Other questions are in a state of great confusion. For example, it is a question whether a manufacturer can be protected on trade-mark principles in the use of a number of names each used to indicate a particular product. Another question that has recently arisen and is most important to us is the right of a manufacturer to give a chemical name to a medicine as the patent or descriptive name and use another more catchy name as a trade-mark. It is very doubtful if this evasion will be upheld by the courts.

In view of the great importance of obtaining judicial opinions on these and other questions arising in the practice of registering trade names of medicines, we recommend that the Committee on Patents and Trade-marks consider the advi-

bility of trying to secure such opinions, and in the event that such action seems desirable it shall be empowered to proceed by and with the advice and consent of the Trustees.

Respectfully submitted,
CHARLES S. BACON, Chairman.
OLIVER T. OSBORNE.
A. BENNETT COOKE.
PHILIP MILLS JONES.
HORATIO C. WOOD, JR.

Report of the Committee on Drug Reform

The report of the Committee on Drug Reform was called for and passed, in the absence of the Chairman, DR. LEWIS S. McMURTRY, Kentucky.

Report of the Committee on Davis Memorial

DR. HENRY O. MARCY, Massachusetts, Chairman, presented the report of the Committee on Davis Memorial as follows, which was referred to the Reference Committee on Miscellaneous Business:

To the Members of the House of Delegates of the American Medical Association:

This is not a report of progress. When your committee was appointed it was believed by your chairman that it would not be difficult to secure the requisite funds for a suitable memorial to Dr. Nathan S. Davis, the founder of this association. Owing, however, to the disaster at San Francisco it was deemed best to defer temporarily the active solicitation of funds, as everyone so far as possible felt it a duty to alleviate the results of that national calamity. Then soon after came the general financial depression, in which our profession had more than its full share.

Nevertheless, notwithstanding these adverse conditions, your committee has not been inactive. They decided that a minimum sum of twenty-five thousand dollars should be raised, and the representatives of the different states accepted that which seemed to them a just apportionment. It was thought the better way that the state societies under the advice of the state representative of this committee should cooperate, and thus every member of the profession be privileged to contribute in a small way toward this fund.

Through the personal effort of your chairman Massachusetts exceeded her apportionment nearly a half, although until recently for almost a generation the great body of the profession in that state was not in affiliation with the Association. In 1907 the Association was asked to appropriate from its funds five thousand dollars toward this memorial. This was recommended, but owing to legislative delays has not yet come to final consideration. The State of Illinois, and especially the City of Chicago, have promised generous assistance to this memorial in honor of one of her first citizens, whose public service in sanitation and hygiene should be kept in undying remembrance.

Upon the presentation of his last report your chairman regretfully stated that the Memorial Committee refused further active cooperation on the part of the states until the Association itself should give encouragement and support by contributing to the fund. The committee urge that this be done at this meeting, and believe that this is essential for the success of the movement. If such appropriation is made by the Association the representatives of the different states who constitute the committee promise their hearty and active cooperation.

The profession of America owes it to itself that the completion of this memorial be not longer delayed, since for many things it is indebted to Dr. Davis more than to any other member of the medical profession for its present state of advancement, affiliation and good will.

HENRY O. MARCY.

Report of the Committee on the Uniform Regulation of Membership

DR. THOMAS McDAVITT, Minnesota, Chairman, read the report of the Committee on Uniform Regulation of Membership, which was referred to the Reference Committee on Constitution and By-Laws.

To the Members of the House of Delegates of the American Medical Association:

This committee was appointed at the Chicago Session in 1908 in accordance with a recommendation contained in the report of the General Secretary. After discussing the lack of uniformity in regulation of membership in county and state societies and emphasizing its importance, the General Secretary said: I therefore recommend that this entire

matter be referred to a committee of three with instructions to secure data regarding the present provisions in the constitution and by-laws of the various state associations on this point as well as the procedure followed by county and state societies and to report its findings and recommendations to the House of Delegates at the next annual session."

REGULATION OF MEMBERSHIP

On August 7, a letter was sent to the secretary of each state association, asking for information regarding the rules observed by each state association. Reports have been received from the secretaries of all the state associations except Georgia. A tabulation of the questions and answers is appended herewith.

(A) FISCAL YEAR

- (1) What is the fiscal year of your state society?
- | | |
|---|----|
| Jan. 1 to Dec. 31.—California, Idaho, Illinois, Indiana, Kansas, Kentucky, Maryland, Michigan, Mississippi, Missouri, Nebraska, New York, Nevada, North Dakota, Ohio, Oklahoma, South Carolina, South Dakota, Utah, Washington, West Virginia, Wyoming..... | 22 |
| Feb. 1 to Jan. 31..... | 0 |
| March 1 to Feb. 28.—Rhode Island..... | 1 |
| April 1 to March 31.—Alabama, Florida, Tennessee, Minnesota..... | 4 |
| April 15 to April 15.—Massachusetts, Dist. of Columbia..... | 2 |
| May 1 to April 30.—Arkansas, Iowa, Louisiana, Montana, New Hampshire, Texas..... | 6 |
| June 1 to May 31.—Connecticut, Maine, New Jersey..... | 3 |
| Sept. 1 to Aug. 31.—New Mexico, Pennsylvania..... | 2 |
| Oct. 1 to Sept. 30.—Delaware, Vermont..... | 2 |
| Dec. 1 to Nov. 30.—North Carolina..... | 1 |
| Annual Session to annual session.—Arizona, Colorado, Oregon, Virginia, Wisconsin..... | 5 |
| No report, Georgia..... | 1 |

In the great majority of cases in which the state association does not have the fiscal year coinciding with the calendar year, the beginning of the fiscal year is purely accidental, running from the approximate date of the annual meeting or from the first of the month immediately preceding or following it. Under the form of organization which previously existed in many states in which the state society existed only at the time of the annual meeting, there was some reason for such a plan. Under the present organization, with the state society always in existence in the form of county societies, there seems to be no reason why the purely accidental occurrence of the annual session at a certain period of the year should have any bearing or influence on the society's finances. If the fiscal year is changed in all cases to coincide with the calendar year, then the reports of the secretaries, treasurers, boards of trustees, etc., will be for the entire fiscal year immediately preceding the annual session at which the report is made. For instance, if the annual session of the state association is held in April, the reports for the fiscal year will be from January 1 to December 31 for the preceding year, while the three months of the new year will be covered in the report at the next session. The advantages of having the fiscal year and the calendar year coincide are obvious. The natural time to pay dues is the beginning of the new year. Any other time is accidental and artificial. If the fiscal year coincides with the calendar year, membership can be held for the entire calendar year and a certificate of membership issued for the calendar year. In this way, a certificate issued for 1908, for instance, will only be good during that year and will naturally expire with the beginning of 1909. A receipt for 1908 dues will be of no value after January 1, 1909. A member credited with dues for 1909 will be a member in good standing throughout the year and there will never be any doubt regarding the exact duration and expiration of dues, membership, etc.

If the county, state, and American Medical Associations, all adopted the calendar year as the fiscal year, membership would expire simultaneously and there would be no overlapping. As it is, in a society having a fiscal year from May 1 to April 30, its members are eligible to membership in the American Medical Association from January 1 to April 30, but ineligible from May 1 to December 31, unless they pay their dues for the balance of the year. As shown by the table above, there being no uniformity in the different states, memberships are expiring at all times during the year and consequently it is necessary to keep up a continual correspondence regarding this matter. If all memberships expired on December 31, the entire record could be revised as soon after January 1 as possible and this revision would then be good for the year, with the exception of the additions, new members, etc. The ad-

vantages of having the fiscal year coincide with the calendar year are apparent.

(2) Do all your county societies have the same fiscal year? If so, what is it?

States in which the fiscal year of county societies runs from Jan. 1 to Dec. 31:—Alabama, Arizona, Colorado, Florida, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, New Mexico, New York, Nevada, Ohio, Oklahoma, Pennsylvania, South Carolina, South Dakota, Texas, Utah, Washington, West Virginia, Wisconsin.....27
States in which the fiscal year in county societies runs from April 1 to March 31:—Connecticut.....1
States in which the fiscal year in county societies runs from April 15 to April 14:—Massachusetts....1
States in which the fiscal year for county societies runs from June 1 to May 31:—Delaware.....1
States in which the fiscal year for county societies runs from Dec. 1 to Nov. 30:—North Carolina.....1
States in which the fiscal year for county societies runs from session to session of the state association: Michigan 1
No report:—Georgia 1
No county societies:—Dist. of Columbia, Virginia...2
Not known:—Montana 1
No uniformity in County Societies:—Arkansas, California, Louisiana, Maine, Minnesota, New Hampshire, New Jersey, North Dakota, Oregon, Rhode Island, Tennessee, Vermont, Wyoming.....13

It hardly seems necessary to present any argument for all the county societies in the same state having a uniform fiscal year. In fact, it is difficult to see how membership matters can be regulated without such uniformity. The advantages of uniformity between the county and state societies on this point are equally obvious. As membership in the state society depends on membership in the county society, it is evident that a member is entitled to membership in the state society for exactly the same period of time that he has paid dues and is recognized as a member in good standing in the county society. Here the simplest plan, i. e., coincidence of the fiscal year with the calendar year, is plainly the best.

(3) Do your by-laws contain any provisions regarding the fiscal year of county societies?

In the following eleven state societies, the duration of the fiscal year of county societies is prescribed by the By-laws of the State Association:—Alabama, Colorado, Idaho, Kentucky, Massachusetts, Missouri, Nebraska, New York, North Carolina, South Dakota, Washington.....11

In the following thirty-five states there are no provisions on this point:—Arizona, Arkansas, California, Connecticut, Delaware, Florida, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Maryland, Michigan, Minnesota, Mississippi, Montana, New Hampshire, New Jersey, New Mexico, Nevada, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, Utah, Vermont, West Virginia, Wisconsin, Wyoming.....35
No report:—Georgia 1
No county societies:—Dist. of Columbia, Virginia...2

(4) Do you think the fiscal year of county and state societies should correspond?

This question was answered in the affirmative by the secretaries of the following twenty-six state associations:—Arkansas, California, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maryland, Mississippi, Missouri, Nebraska, New Hampshire, New York, Nevada, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, Texas, Utah, Vermont, Washington, West Virginia, Wyoming.....26

The question was answered in the negative by the following nineteen states:—Alabama, Arizona, Colorado, Connecticut, Delaware, Florida, Idaho, Maine, Michigan, Minnesota, Montana, New Jersey, New Mexico, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Wisconsin.....19
No expression:—Massachusetts 1
No report:—Georgia 1
No county societies:—Dist. of Columbia, Virginia...2

(5) What do you consider the best arrangement for the fiscal year so far as the county societies and the state association are concerned?

The replies received on this point were practically unanimous, each secretary stating that he considered the plan followed in his own state to be the best.

(b) DUES

(1) At what time do your by-laws call for the payment of county society dues?

No provision in the by-laws:—California, Illinois, Iowa, Louisiana, Maryland, New Hampshire, North Dakota, Pennsylvania, Rhode Island, Vermont.....10
On Jan. 1:—Arizona, Colorado, Idaho, Indiana, Kansas, Kentucky, Missouri, New Mexico, New York, Nevada, Texas, Wisconsin, Wyoming.....13
April 1:—Maryland, Minnesota, North Carolina, Oklahoma 4
April 15:—Massachusetts, New Jersey.....2
April 30:—Oregon 1
Dec. 1:—Michigan, Washington.....2
Thirty days before annual session:—Arkansas, Maine, Montana, Nebraska, Ohio, South Carolina, South Dakota, Tennessee, Utah.....9
Before annual session:—Delaware, Florida.....2
Before close of annual session:—Alabama.....1
Quarterly:—Connecticut 1
No answer:—West Virginia.....1
No report:—Georgia 1
No county societies:—Dist. of Columbia, Virginia...2

(2) When does the county secretary remit to the state secretary the amount of the state per capita assessment?

January 1:—California, Indiana, Kansas, Kentucky, Maryland, Washington, Wyoming.....7
May 1:—Minnesota, Nebraska, Oklahoma, Texas, West Virginia 5
May 15:—Connecticut, New Jersey.....2
July 1:—Colorado 1
August 1:—Idaho 1
September 1:—Nevada, Pennsylvania.....2
December 31:—Michigan, Missouri.....2
Thirty days before annual session:—Arizona, Iowa, Louisiana, Maine, North Dakota, South Dakota, Tennessee, Utah 8
Before annual session:—Arkansas, Delaware, New Mexico, North Carolina, Oregon, Wisconsin.....6
During annual session:—Alabama.....1
"When they get ready":—Florida, Montana.....2
No report:—Georgia 1
No county societies:—Dist. of Columbia, Virginia...2

In addition, the following replies, impossible to classify, have been received from eight state secretaries.

Illinois:—"County secretaries must remit prior to April 15, next, but the vast majority remit before November 15 of the current year."

Massachusetts:—"The district treasurer remits to the treasurer of the state society." (Massachusetts is organized on the district and not on the county plan.)
New Hampshire:—"Our county societies do not become component societies until May 1, 1909." (New Hampshire has recently established component county societies.)

New York:—"The secretary has nothing to do with dues."

Ohio:—"At his own sweet will. Sometimes, as collected, in groups, or as a whole just before the annual meeting, with scattering returns throughout the rest of the year."

Rhode Island:—"The state society collects from each individual member and not through the county society."

(3) Does the secretary of each county society remit for the entire society or for each individual member as he pays his dues?

For the entire society:—Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Idaho, Illinois, Iowa, Kansas, Kentucky, Louisiana, Mississippi, Montana, New Mexico, Nevada, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Vermont, Wisconsin 30

For individual names as received:—Maryland, Michigan, Minnesota, Missouri, Nebraska, Rhode Island, South Carolina, Washington, Wyoming.....9

No rule on this point:—Massachusetts, New Hampshire 2
Both:—New Jersey, West Virginia.....2

No report:—Georgia 1
No county societies:—Dist. of Columbia, Virginia...2

(4) Do you, as the secretary of the state association, accept payments of the per capita assessment from individual members, or must they come through the county society?

In forty states, the per capita assessment is only accepted through the county society. Those in which this is not the case are:—

- From the county treasurer to the state treasurer; New York, Pennsylvania, South Carolina.....3
From each member; Rhode Island.....1
Not yet determined; New Hampshire, Oklahoma.....2
(5) Do you enroll a member when reported by the county secretary regardless of whether or not the per capita assessment is paid for him or do you wait until the individual assessment is paid before enrolling the member?
Members enrolled when reported by county secretary:—Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Idaho, Louisiana, Montana, Oregon, Pennsylvania, Wyoming.....12
Members enrolled only when per capita assessment is paid:—Alabama, Florida, Illinois, Indiana, Iowa, Kansas, Kentucky, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New Jersey, New Mexico, New York, Nevada, North Carolina, North Dakota, Ohio, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, West Virginia, Wisconsin.....31
No report:—Georgia.....1
No county societies:—Dist. of Columbia, Virginia.....2
No provisions on this point:—Maine, New Hampshire, Oklahoma.....3

[Further questions and answers, regarding manner of paying assessments, etc., are omitted, owing to the amount of space required to tabulate the replies.]

SUSPENDED MEMBERS

It is difficult to analyze the answers under this head on account of the confusion existing in the use of the word "suspended." In some state associations, a member delinquent after a certain time is suspended and is no longer considered in good standing or entitled to the privileges of membership, yet he is still regarded as a member and is not dropped or entirely separated from the organization until the expiration of a probationary period. In other state societies there are no provisions for suspension, a member being dropped as soon as he becomes delinquent or as soon as the year for which his dues are paid has expired. In some states suspension simply means arrears in dues, while in others it is equivalent to being dropped from the society. These facts should be kept in mind in the interpretation of the following answers:

- (1) Are delinquent members suspended for non-payment of dues, and if so, how far in arrears must they be before being suspended?

- State Associations not providing for suspension:—Alabama, Minnesota, Mississippi.....3
Suspension on Jan. 1:—Washington, Missouri.....2
Suspension at the end of two months:—Indiana.....1
Suspension at the end of three months (April 1):—Arizona, Kentucky, Oklahoma, Oregon, South Dakota, Texas, Utah, Wyoming.....8
Suspension at the end of four months (May 1):—Illinois, New York, West Virginia.....3
Suspension at the end of five months (June 1):—Kansas, New Jersey.....2
Suspension at the end of six months (July 1):—Colorado.....1
Suspension at the end of ten months (November 1):—Michigan, Nevada.....2
Suspension at the end of one year:—Arkansas, Connecticut, Delaware, Idaho, Louisiana, Maryland, New Mexico, Nebraska, North Carolina, South Carolina, Tennessee, Vermont.....12
Suspension at the end of two years:—Rhode Island:—1
Suspension at the end of three years:—Massachusetts, New Hampshire.....2
Suspension after state meeting:—Ohio.....1
Suspension as soon as reported delinquent:—California, Iowa.....2
Suspension regulated by county societies:—Florida, North Dakota, Pennsylvania.....3
No county societies:—District of Columbia, Maine, Virginia.....3
No report:—Georgia.....1

- (2) Is the roll of the state association made up complete each year from the reports of the county secretaries, or is a member once entered carried as such until specifically reported as died, suspended, resigned, dropped, etc?

In thirty-six states the roll is made up each year from the reports received from the county secretaries....36
In the District of Columbia, New Hampshire and Vir-

ginia there are no county societies (organization now taking place in New Hampshire).....3
No report:—Georgia.....1

Reports from 8 societies are as follows:—

Illinois: A member once entered is carried until specifically reported on, and if no report is made by the 15th of April next following he automatically stands suspended.

Massachusetts: The roll is made up each year from the report of the secretary of the state society.

New Mexico: Names once reported are carried until reported as dropped, dead, etc.

Oregon: Members are carried until they are dropped by the secretary of the county society.

Pennsylvania: We ask for changes in membership as they occur, but we do not always get what we ask for. We publish a list of the officers and members each March. We get a revised list again in August.

Rhode Island: A member once entered is carried.

Washington: A member once entered is carried until some change is reported, as above.

Wyoming: A member is carried after once reported until reported as dead, etc.

- (3) Are all members "not in good standing" regarded as "suspended?"

No provision for suspension:—Alabama, Minnesota, Mississippi, Massachusetts, Washington.....5

The following states answer the above question in the affirmative:—Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Idaho, Illinois, Indiana, Iowa, Kentucky, Missouri, Nebraska, New Hampshire, New Jersey, New York, Nevada, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, West Virginia, Wisconsin, Wyoming.....32

The following states answer the above question in the negative:—Louisiana, New Mexico, Rhode Island, Utah.....4

The report from Kansas says: Suspended in the county society. Report from Maryland: Suspended at the end of one year. Report from Michigan: Suspended on October 1.....3

No county societies:—District of Columbia, Maine, Virginia.....3

No report:—Georgia.....1

- (8) Are members notified when dropped?

Yes. California, Connecticut, Delaware, Idaho, Kansas, Kentucky, Louisiana, Maryland, Michigan, Montana, Nebraska, New Hampshire, New Jersey, New Mexico, New York, Nevada, Ohio, Rhode Island, Texas, Vermont, Wyoming.....21

No. Arizona, Arkansas, Colorado, Illinois, Missouri, North Carolina, Oklahoma, South Dakota, Tennessee, Utah, West Virginia, Wisconsin.....12

Notified by county secretary:—Indiana, Iowa, South Carolina.....3

By publication in the state journal:—Pennsylvania.....1

Depends on the county secretary:—Florida, Oregon.....2

No suspended members:—Minnesota, Mississippi.....2

No county societies:—District of Columbia, Maine, Virginia.....3

No report:—Georgia.....1

The following replies could not be tabulated:—

Massachusetts: "Members dropped after three years delinquency."

North Dakota: "I suspect that a good secretary uses that lever in trying to collect from a slow or delinquent member."

Washington: "County secretary is notified."

(D) BEST METHOD OF HANDLING MEMBERSHIP MATTERS

This question was intended to call forth suggestions from the state secretaries regarding the best method of regulating memberships as far as the relation between county and state societies, reports of secretaries, forms and blanks used, etc., were concerned. The following answers are selected from the replies received—

Connecticut: Members should be enrolled each year from the reports of the county secretary. If in arrears for more than one year, they should be dropped and admission secured only by re-election.

Michigan: Card system. Never destroy a card. July 1, send county secretary list of all unpaid members for him to check up errors. Request him to push collections, September 1, individual letter to delinquents, urging them to keep up membership and pay through the county secretary. November 1, second individual letter, saying that dues have not been re-

ceived and member will be dropped with notice to the American Medical Association to that effect if his dues are not received by November 30

Minnesota. Have the fiscal year of all county societies the same. Membership only good until the end of the fiscal year. The same with the state organization. There should be no elasticity in this matter. It is this acceptance of the procrastinating methods of many doctors that has made the financial ends so hard to manage.

New York. It would seem that the carelessness of members in the conduct of their private business affairs has been carried into the conduct of the medical society, both county and state. The sooner a return is made to business principles the better. The quicker the custom of unbusinesslike methods in the conduct of medical societies is abandoned the better it will be for all concerned. The action of the by-laws should be automatic. It should not be left to an individual or to a committee to say to this or that member "You are suspended," or to wink at the fact that a member has not paid his dues. The card index system is certainly the best. In this office only one list is kept. Three boxes, or one box divided into three parts for a small society, can be used. Make a list of all members on cards, putting on each card the data necessary. When a member is suspended take his card out of the membership box and put it in the suspended box. When dropped transfer it to the delinquent box. If he at any time pays his dues, and is reinstated the card can then be transferred to the active list. If he dies the card can be put in the dead box or destroyed, although it is not a good plan to destroy any society records.

Oregon. A fiscal year from January 1 to January 1 in county societies. The state association is at present (The fiscal year in Oregon is from annual session to annual session generally July 1 to July 1). Dues to be paid to the end of each year. Suspension of members not paying before the meeting of the state association. Automatic reinstatement if dues are paid up before the following January. Newly elected officers to take office January 1, no matter when the annual meeting occurs.

Pennsylvania. Members should be suspended automatically when six months in arrears. Never "carry" a member under any circumstances. If he is not able to pay his dues, pay them for him by resolution. The state society should have nothing to do with the collection. [In a personal letter, Dr. Stevens, the state secretary, outlines the history of the present methods in Pennsylvania, at length.]

Washington. Monthly reports from county societies. Use of card index by county and state secretaries. Cards to show all information regarding each member, and also carry any account of dues paid.

A careful examination of the above tabulation will show that the greatest difficulties in the way of uniform regulation of membership are

(1) Lack of uniformity regarding fiscal year and termination of membership

(2) Lack of definite specific regulations regarding time when dues must be paid and when members are suspended for non-payment

(3) Lack of sufficiently comprehensive system adaptable to conditions in different parts of the country by which county secretaries can report changes in membership to state secretaries easily and accurately, thus keeping the state secretaries informed regarding the status of membership in each county.

It is evident that if the by-laws of this Association are to be enforced, and if the membership in the American Medical Association is only to be held by members in good standing of county and state societies, a simple, easily operated and effective system for the transmission of such official information regarding membership must be established. The present lack of uniformity and system in the regulation of membership is costing the organized profession of the country thousands of dollars each year in the form of postage, clerk hire, stenographers' salaries, etc., necessary to carry on an enormous amount of correspondence regarding details which should not be necessary were an automatic system put in operation. In addition to the unnecessary expense, there is also a much larger loss on account of members who are dropped or suspended, or who relinquish their membership owing to misunderstanding regarding the provisions regarding dues, good standing, etc. If a general system were adopted to which all state and county societies, as well as the American Medical Association could conform, an enormous amount of time and labor could be saved each year and a large number of members retained who are now lost.

In a recent number of the *Outlook* appeared an article on the business methods of one of the leading railroad mag-

nates of the United States, in which, as one of the reasons for his success, emphasis was laid on his careful attention to details and his ability to save money and labor by systematic management. Describing the reorganization of the Union Pacific Railroad, the writer said that when Mr. E. J. Harriman took charge of the road there were twenty-two divisions, each one of which had its own system of blanks, forms, reports, etc., and that one of the first acts of the new president was to call for copies of every blank used in every division of the road. When these were all received they filled a large room, showing an enormous number of different blanks of all different sizes and varieties, many of them designed for the same purpose. By uniting and standardizing the stationary and forms used in the twenty-two different divisions, by having all printed matter made in "stock size" (that is, sizes which could be cut from the commercial sizes of paper, cardboard, etc., without waste), and by systematizing the manner of sending in and tabulating reports, it was found that the saving effected was more than sufficient to meet the entire expenses of the stationary department. If the adoption of standard and uniform blanks, forms and methods by the Union Pacific Railroad with twenty-two divisions was of sufficient importance to merit the personal attention of the president, surely the uniform and mechanical administration of membership matters on the part of the American Medical Association, with 50 constituent associations and 1,996 component county societies, comprising 70,000 members, is of sufficient importance to merit the most careful consideration of its executive officers. We must either continue in the present unsystematic, unbusinesslike, wasteful method of regulating and recording membership matters in county, state and national organizations or we must devise a satisfactory plan which will be capable of general adoption by all the county and state societies, and by which membership matters can be handled quickly, mechanically and accurately.

The printing plant of the American Medical Association can produce all blanks and forms necessary for county and state societies at a much lower cost than the work can possibly be done for elsewhere. The printed matter can be made in uniform and standard sizes so that it can be cut without waste, and the expense thereby diminished. Forms and blanks, once agreed upon, can be stereotyped and printed in large quantities at a very low cost. Report blanks, membership certificates, notification cards, etc., can be put up in sets for county societies of different sizes and for state associations, and can be supplied regularly. All supplies needed for all county and state societies can be supplied from a central bureau at a minimum expense. The work of county and state secretaries can be greatly facilitated and the value of these officers to their respective organizations greatly increased, not only without increased work on their part, but with a decided reduction of the amount of work required.

Your committee therefore makes the following recommendations:—

(1) That all state associations be requested to make their fiscal year conform to the calendar year and to request their component county societies to adopt the same rule.

(2) Your committee further recommends that this committee be continued, that it be increased by the addition of four state secretaries and that it be instructed to draft uniform by-laws for the regulation of membership for state and county societies, as well as to devise a system of necessary blanks, forms, etc., which will be applicable for general use and which can be recommended to the House of Delegates to state societies for adoption.

MEMBERSHIP QUALIFICATIONS

In addition to the question of the mechanical regulation of membership, which the committee considered the main question submitted to it, it has also been suggested that this committee take up the question of the requirements for membership so far as personal qualifications are concerned. It is evident that a lack of harmony on this subject as well exists among the various county and state organizations. No effort has been made to secure data on this point other than to tabulate the constitutional provisions of the various state associations as shown by the last copy of the constitution and by laws on file at the General Secretary's office. A summary of the provisions in the various states follows:—

AMERICAN MEDICAL ASSOCIATION. Requirements for membership in the American Medical Association are: (1) Membership in good standing of the constituent association of the state in which the applicant resides. (2) Written application for membership on the prescribed form. (3) Payment of the annual dues.

ALABAMA: Graduates of reputable medical colleges, holders of certificates of qualification granted by the State Board of Examiners or by a county board of examiners are eligible to membership in county medical societies.

ARIZONA: Requirements those of the standard constitution and by-laws for state societies.

ARKANSAS: Every reputable physician, a graduate of a regular medical college, recognized by the Federation of Medical Colleges.

CALIFORNIA: Standard constitution and by-laws.

COLORADO: Standard constitution and by-laws.

CONNECTICUT: Members of county medical societies are members of the state association. Provision regarding membership in county societies are those of the standard constitution and by-laws.

DELAWARE:

DISTRICT OF COLUMBIA: Legally qualified, regular practitioners of medicine residing in the District and engaged in no other occupation.

FLORIDA: Every reputable, white, legally registered physician practicing non-sectarian medicine is entitled to membership.

GEORGIA: Every reputable and legally registered white physician who does not practice or claim to practice nor lend his support to any exclusive system of medicine shall be eligible to membership.

HAWAII: Regular practitioners in good standing who hold a license to practice medicine under the laws of the territory.

IDAH0: Standard constitution and by-laws.

ILLINOIS: Standard constitution and by-laws.

INDIANA: Standard constitution and by-laws.

IOWA: Standard constitution and by-laws.

KANSAS: Standard constitution and by-laws.

KENTUCKY: Standard constitution and by-laws.

LOUISIANA: Standard constitution and by-laws.

MAINE:

MARYLAND:

MASSACHUSETTS: Applicants must be over 21, of sound mind and good moral character, must possess a good English education, hold a diploma from a medical school recognized by the council, satisfy the censors that they do not practice any exclusive system of medicine and that they possess such other qualifications as the society shall deem advisable.

MICHIGAN: Every reputable and legally registered physician who is practicing or who will agree in writing over his own signature to practice non-sectarian medicine only and who will sever all connection with sectarian colleges, societies, institutions, etc., shall be eligible to membership.

MINNESOTA: Standard constitution and by-laws.

MISSISSIPPI: Standard constitution and by-laws.

MISSOURI: Standard constitution and by-laws.

MONTANA: Standard constitution and by-laws.

NEBRASKA: Every reputable and legally registered physician, a graduate of a college which at the time of his graduation was considered in good standing, etc., provided that licentiates admitted under the laws of 1881 and registered as regular physicians and who have continuously practiced regular medicine in Nebraska may be admitted to membership.

NEVADA: Graduates of a recognized medical college in good moral and professional standing proposed in writing at a regular meeting and elected by a three-fourths vote on recommendation of the board of censors.

NEW JERSEY: Standard constitution and by-laws.

NEW HAMPSHIRE: Standard constitution and by-laws.

NEW MEXICO: Standard constitution and by-laws.

NEW YORK: Membership in the state society includes all members of all chartered county societies. The only provisions found in the by-laws of the state association regarding membership in county societies is Sec. 2, Chap. 9, which provides that full and ample opportunity shall be given every reputable physician to become a member of the society in the county in which he resides, and Sec. 8 of the same chapter, which provides that each county society may adopt a constitution and by-laws for the regulation of its affairs, provided the same shall first be approved by the council of the state society.

NORTH CAROLINA: Standard constitution and by-laws.

OHIO: Standard, with the addition, "Who is not affiliated with any organization which aims to foster any exclusive dogma in therapeutics."

OKLAHOMA:

OREGON: Standard, with the substitution of the clause, "Who is practicing in accordance with the Code of Ethics of the American Medical Association," in place of the clause, "Who does not practice or claim to practice or support sectarian medicine."

PENNSYLVANIA: Standard constitution and by-laws.

RHODE ISLAND: Standard constitution and by-laws.

SOUTH CAROLINA: Every reputable and legally registered white physician who does not practice or claim to practice sectarian medicine.

SOUTH DAKOTA: Standard constitution and by-laws.

TENNESSEE: Standard constitution and by-laws.

TEXAS: Every reputable and legally registered white physician, etc.

UTAH: Standard constitution and by-laws.

VERMONT: Membership in the state association consists of all members of all county societies and all others who were active members of the society at the time the amended constitution was adopted.

VIRGINIA:

WASHINGTON: Each county society shall judge of the qualifications of its own members. School of graduation shall be no bar to membership provided the applicant does not claim to practice any exclusive system of medicine.

WEST VIRGINIA: Standard constitution and by-laws.

WISCONSIN: Standard constitution and by-laws.

WYOMING: Standard constitution and by-laws.

The committee has not taken this matter up but would recommend that this question be referred to the enlarged committee for further consideration.

PROCEDURE IN CASES OF DISCIPLINE

Another matter which has been suggested as coming under the jurisdiction of the committee is that of the provisions of the by-laws of county and state societies and the American Medical Association relating to the method of procedure in disciplining members. Cases for discipline occasionally arise, in which it is necessary to put a member on trial under charges of unprofessional conduct, etc. Much confusion exists in the provisions found in the constitutions of the different parts of the organization on this point. The by-laws of the American Medical Association provide (Sec. 4, Chap. 10, Book 3, page 19) for a Judicial Council, to which "shall be referred all questions, complaints, protests and matters of an ethical nature. When such complaints, protests, etc., concern an individual's relations with his local society they shall be considered by this council only after the same shall have been referred to the constituent association concerned or of an appeal from such constituent association. Its decision shall be subject to appeal to the House of Delegates."

There is no provision in this by-law as to how an appeal from the constituent association shall be made; as to whether an appeal can be made by either the constituent association or the individual involved, or whether an appeal can be made by a member other than the member on trial. Neither is there any provision as to the length of time after a decision in which an appeal must be made. There is consequently nothing to prevent an appeal to the Judicial Council being made on any question which has ever been before a constituent association. Obviously there should be some provisions regarding the form and manner of an appeal, as well as a limit to the length of time within which an appeal can be filed.

The provisions of the state constitutions and by-laws are equally vague. The standard constitution for state associations prepared by the Organization Committee (Sec. 3, Chap. 7, page 18), provides that "the Council shall be the Board of Censors of the state associations. It shall consider all questions regarding the right and standing of members, whether in relation to other societies, component societies or the state association." There is no clear provision regarding the manner of appeal from the decision of the county society, either to the councilor for the district or to the Judicial Council of the state society. If appeal is made to the councilor of the district, how soon after the decision of the county society in the case should the appeal be made? In what form should it be presented? Has either party the right of appeal or only the defendant? Should the appeal contain an abstract of the testimony as shown by the records of the society or simply an *ex parte* statement from the party appealing? How soon after the case is appealed to the individual councilor should he render a decision? There is at present nothing to prevent the councilor from putting the papers in the case in his pocket and declining to render a decision. If the case is appealed to the Judicial Council, does this body have a right to reopen the case and hear new evidence, to pass on the truthfulness of the evidence submitted and to decide the case on its merits, or would the council be authorized simply to review the evidence as presented at the first trial without going back of the record? Can the council of the state society have original jurisdiction in any case, or can it only hear cases on the appeal from the individual councilor or from the decision of the county soci-

eties? The standard constitution and by-laws provide that all questions involving the rights and standing of members, no matter of what nature, shall be referred to the council without discussion, that the council shall decide, and that its decision shall be final. This evidently puts a bar on any appeal to the House of Delegates of the state association. Does it also act as a bar to an appeal to the Judicial Council of the American Medical Association? No provision is made in the standard constitution and by-laws for such an appeal, nor is the manner in which an appeal can be made specified.

The same lack of clearness exists in the standard constitution and by-laws for county societies. Sec. 2, chap. 4, page 12, provides, "that the Board of Censors shall investigate charges preferred against a member and report its conclusions and recommendations to the society." Sec. 7, chap. 1, provides for the filing of such charges against a member, but does not specify how such charges shall be heard by the Board of Censors. Such questions as the following are frequently referred to the General Secretary by secretaries of county societies, members of boards of censors or members under accusation of unprofessional conduct: Is the accused entitled to be represented before the board by another member or by a non-member (attorney, for instance), or must he defend himself? Has the Board of Censors the right or authority to examine witnesses from among members of the society? Can members not members of the society testify before the Board of Censors? Has the accused the right to present witnesses who are not members? Can charges be brought against a member of the county society by a non-member? How should charges brought against a member by a layman be disposed of? Has the accused member the right to cross-examine witnesses introduced by the complainant? Has the accused member the right to introduce affidavits or signed statements in case he is not able to secure the presence of witnesses necessary to prove essential facts, etc?

Inasmuch as the difficulties and misunderstanding growing out of such cases are largely due to lack of specific provisions regarding these details, the importance of definitely outlining the method of procedure so as to leave no doubt on any point and yet so fully as to safeguard the rights of all concerned is evident.

As this matter has been presented to your committee for consideration, we would recommend that it be referred either to this committee, to the Committee on Organization or to the Judicial Council for careful consideration and for the formulation of specific provisions for the by-laws of the American Medical Association and for the standard constitution and by-laws for county societies, as well as for recommendation to the state societies.

Respectfully submitted,

THOMAS McDAVITT, Chairman.
WALTER STEINER,
FREDERICK R. GREEN.

Committee on Triennial Reapportionment

THE FIRST VICE-PRESIDENT: I wish to announce the Committee on Triennial Reapportionment, namely: Dr. J. F. Percy, Illinois, chairman; Dr. E. J. Goodwin, Missouri, and Dr. O. J. Brown, Massachusetts.

Name of Section on Cutaneous Medicine and Surgery

The General Secretary read the following communication, addressed to Dr. R. R. Campbell, delegate of the Section on Cutaneous Medicine and Surgery, from the secretary of the Section:

At the 1907 Session of the Section on Cutaneous Medicine and Surgery at Atlantic City, it was moved that a committee consisting of the incoming officers of the Section and the members of the Executive Committee should obtain an expression of opinion as to what name they considered most advisable for the Section, inasmuch as a great deal of dissatisfaction had been expressed with the present name of the Section, which was changed some years ago from that of the Section on Dermatology to that of the Section on Cutaneous Medicine and Surgery.

The Secretary, in accordance with the above instructions, mailed 222 reply postal cards to the various members who had registered in the Section during the past four years in accordance with the list of the 1907 transactions. One hundred and twenty-two responses were received; two cards were returned from the Dead Letter Office with the present address unknown. Of this number, 80 members expressed themselves in favor of changing the name to Section on Dermatology; 19 favored retaining the present name, Section on Cutaneous Medicine and Surgery; 7 favored Section on Diseases of the Skin; 5. Section on Dermatology and Syphilology; 4, Section on

Cutaneous Diseases; 1, Section on Dermatology and Malignant Growths; 1, Section on Skin Diseases, Nutrition and Elimination; 1, Section on Cutaneous Medicine and Radiotherapy; 1, Section on Eruptive Diseases; while 3 were indifferent to the situation. Analysis of the result showed that 100 out of 119 members expressed themselves as dissatisfied with the present name of the Section. The name, Section on Dermatology, received four times as many votes as the present name of the Section, which was the next highest on the list, and received almost twice as many votes as all the other names combined.

This report, which was submitted and signed by the committee, was accepted by the Section, to be transmitted to the House of Delegates with the recommendation of the Section that its name be changed to Section on Dermatology.

I therefore ask you kindly to bring this matter before the House of Delegates and to use your kind offices in effecting this desired change for the Section.

This communication was referred to the Reference Committee on Sections and Section Work.

The Use of the Red Cross Emblem

MAJOR M. W. IRELAND, United States Army, presented the following resolutions adopted by the Executive Committee of the American National Red Cross, Oct. 18, 1907:

WHEREAS, By international agreement in the Treaty of Geneva, 1864, and the Revised Treaty of Geneva, 1906, "the emblem of the Red Cross on a white ground and the words Red Cross or Geneva Cross" were adopted to designate the personnel protected by this convention, and

WHEREAS, The treaty further provides (Art. 23) that "the emblem of the Red Cross on a white ground and the words Red Cross or Geneva Cross can only be used whether in time of peace or war, to protect or designate sanitary formations and establishments, the personnel and material protected by this convention," and

WHEREAS, The American National Red Cross comes under the regulations of this treaty according to Article 10, "volunteer aid societies, duly recognized and authorized by their respective governments," such recognition and authority having been conferred upon the American National Red Cross in the charter granted by Congress, Jan. 5, 1905, Sec. 2. "The corporation hereby created is designated as the organization which is authorized to act in matters of relief under said treaty," and, furthermore,

WHEREAS, In the Revised Treaty of Geneva, 1906, in Article 27, it is provided that "the signatory powers whose legislation should not now be adequate, engaged to take or recommend to their legislatures such measures as may be necessary to prevent the use by private persons or by societies other than those upon which this convention confers the right thereto of the emblem or name of the Red Cross or Geneva Cross," be it

Resolved: That the executive committee of the American National Red Cross requests that all hospitals, health departments and like institutions kindly desist from the use of the Red Cross created for the special purpose mentioned above, and suggests that for it should be substituted some other insignia, such as a green St. Andrew's cross on a white ground, to be named the "Hospital Cross," and used to designate all hospitals (save such as are under the Medical Department of the Army and Navy and the volunteer aid society of the government), all health departments and like institutions, and, further, be it

Resolved: That the Executive Committee of the American National Red Cross likewise requests that all individuals, associations, or business firms and corporations who employ the Geneva Red Cross for business purposes, kindly desist from such use, gradually withdrawing its employment and substituting some other distinguishing mark.

After submitting the above preambles and resolutions from the American National Red Cross, Major Ireland introduced the following resolutions, which were referred to the Reference Committee on Legislation and Political Action:

WHEREAS, By the terms of the Treaty of Geneva, 1864, and the Revised Treaty of Geneva, 1906, the emblem of the Greek Red Cross on a white ground, and the words "Red Cross" or "Geneva Cross," were adopted to designate the personnel and material of the medical departments of the military and naval forces and of the recognized volunteer aid societies in time of war, for the humane purpose of rendering them immune from attack and capture, and

WHEREAS, The United States, as well as all other civilized powers, is a signatory to said territory, and

WHEREAS, The use of the Red Cross by medical associations and individuals of the medical profession must seriously impair the usefulness of the emblem for the purposes for which it was created and adopted, be it therefore

Resolved: That it is the sense of the American Medical Association that the use of the Geneva Cross by associations or individuals, other than those of the Army, Navy and Red Cross Society should be discontinued and, if desirable, some other insignia adopted, and be it further

Resolved: That the adoption of this resolution be given as wide publicity as possible in the medical journals of the country.

DR. SAMUEL WOLFE, Pennsylvania, supplemented the resolutions presented by Major Ireland by introducing the following preambles and resolution, which were also referred to the Reference Committee on Legislation and Political Action:

WHEREAS, It is held that the Red Cross, which now constitutes the main character in the official badge of the American Medical Association is eminently distinctive of certain broader fields of philanthropy, rather than of medicine in particular, and

WHEREAS, The traditions of medicine would be fully satisfied by the adoption of a design as herewith submitted and described as follows:

A shield on which is emblazoned the American Eagle holding in its talons a laurel wreath within which is the knotty rod and entwined serpent and the letters A. M. A. Therefore, be it
Resolved: That the American Medical Association adopt as its official insignia or badge this design.

Resolutions Regarding Creation of New Section

DR. EUGENE C. HAY, Arkansas, presented the following:

WHEREAS, It is a fact that not sufficient attention is paid by the general profession to the study of syphilis and its treatment, and likewise genitourinary diseases, this condition I believe is caused by the neglect of these important branches by our national Association, I consider the time is ripe for the creation of a new section in the American Medical Association, and

WHEREAS, All the recent progress and development in the pathology of syphilis has been made in Europe, the pathology treatment and armamentarium in modern genitourinary work all comes from the other side, hence I think we should keep abreast of our European brothers in this rich and prolific field of labor. Any one presenting a paper on syphilis before the American Medical Association is referred to the Section on Cutaneous Diseases and Surgery. One presenting a paper on a genitourinary subject is referred to the Section on Surgery and Anatomy. As most genitourinary men and very few dermatologists the two diseases, syphilis and gonorrhea, are together in the minds of the laity, it is perfectly natural that any member of the profession who makes a specialty of either, naturally becomes a specialist in both, resulting from the class of patients who consult him. Therefore, be it

Resolved: By the House of Delegates now assembled that the American Medical Association pass a resolution for the creation of a new section to be called the Section of Venereal and Genitourinary Diseases.

The resolution was referred to the Reference Committee on Sections and Section Work.

On motion, the House of Delegates then adjourned until 2 p. m. Tuesday.

Third Meeting—Tuesday, June 8, 1909

The House of Delegates met at 2 p. m., and was called to order by the President, DR. WILLIAM C. GORGAS, U. S. Army.

The Secretary called the roll, and eighty-one members responded.

DR. H. BERT ELLIS, California, Chairman, presented an additional report for the Committee on Credentials.

The minutes of the previous meeting were read and adopted.

Grant for Scientific Research

DR. WILLIAM H. WELCH, Maryland, Chairman of the Board of Trustees, presented the following report of the Board of Trustees in regard to the report of the Committee on Scientific Research:

Supplementary Report of the Board of Trustees

The Board of Trustees approves the recommendation of the Committee on Scientific Research, that the grant of \$200 to Dr. Carl Voegtlin and Dr. W. G. MacCallum be allowed, and would urge the advisability of sending to all recipients of grants a statement of the rules governing such appropriations.

The Board at the February meeting anticipated the recommendation of the Committee by increasing the annual appropriation to \$1,000.

The Board desires to commend the work of the Committee on Scientific Research. The results obtained by the grants in the promotion of scientific research fully justify the relatively modest expenditure of the funds appropriated for this purpose by the Association.

On motion of DR. G. L. TANEXHILL, Maryland, the report was accepted and adopted.

Report of the Reference Committee on Medical Education

DR. GEORGE DOCK, Section on Practice of Medicine, Chairman, presented the following report of the Reference Committee on Medical Education:

To the House of Delegates of the American Medical Association:

The Reference Committee on Medical Education endorses the report of the Council on Medical Education and recommends the report to the careful attention of the Association, as well as to medical educators.

The Reference Committee believes that the work of the Council is one of the most important undertakings of the Association, and believes the Council should receive the most thorough financial and moral support of the Association. It recommends that the Council be continued and that provision be made for carrying on its work.

It wishes to go beyond the report and to recommend especially the valuable compilations and analyses of the results of examinations by state boards for medical licensure as published annually in THE JOURNAL.

It also recommends the compilation of laws regulating the study and practice of medicine.

It hopes that the recommendations in regard to practical examinations before state boards will receive the careful attention of those boards. It suggests that the questions in the examinations be as practical as possible, and that efforts be made to provide practical clinical and laboratory examinations as soon as the laws and regulations can be made to permit.

The Committee also recommends that state boards of medical examiners endeavor to make the examinations uniform regarding preliminary and professional training, believing that uniformity in examination will tend to bring about a solution of the problem of reciprocity and remove one of the most serious objections to the present working of state board examinations.

It endorses the method and results of the investigations and reports on medical schools, as carried out by the Council, and calls attention to the section in the report showing the progress and consolidation of medical colleges.

It commends the work of the Council in the effort to establish a uniform curriculum, believing that even if the course submitted can not be adopted at once, it must be of great value as a standard of comparison, and a guide to future changes.

GEORGE DOCK, Chairman.

H. D. ARNOLD.

A. VANDER VEER.

VICTOR H. STICKNEY.

W. W. RICHMOND.

On motion of DR. L. F. BARKER, Maryland, seconded by Dr. S. S. CROCKETT, Tennessee, the report was adopted as read.

Report on the Scientific Exhibit

DR. FRANK B. WYNN, Indiana, Chairman, read the following report on the Scientific Exhibit:

To the House of Delegates of the American Medical Association:

It is of passing interest to note that ten years ago in this city was presented the first scientific exhibit. The project was experimental, and those who undertook the work did so with trepidation, but with a strong feeling of hope and confidence in its practicability and usefulness. The passing years have justified the faith. The Scientific Exhibit has become as much a part of the permanent work of the Association as the work of the Sections.

The exhibit submitted at this time emphasizes the effort of the Committee to classify and systematize the work. The features made more or less prominent in this exhibit are:

(a) Specimen groups, gross and microscopic, illuminating special phases of pathology, diagnosis, etc.

(b) Research exhibits.

(c) Those relating to hygiene and sanitary science.

I wish to express my deep appreciation of the cordial cooperation, the untiring and efficient service of my colleagues on the Committee, Dr. W. M. L. Coplin and Dr. Ross McPherson; also to tender thanks to Dr. John M. Swan of the local committee in Philadelphia, and to Dr. I. E. Leonard of the local committee in Atlantic City, and to the many exhibitors whose names appear below. It is only through the devotion of such unselfish men, cherishing the higher ideals in medicine, that the scientific exhibit becomes possible.

So far as definitely ascertained at this date, the exhibitors are given below; others will unquestionably be added to this list:

John M. Swan, Polyclinic Hospital, Philadelphia, the pathology of malaria.

Howard T. Karsner, University of Pennsylvania, tumors of the gastrointestinal tract.

W. M. L. Coplin and John Funk, Jefferson Medical College, a series illustrating the morbid anatomy of renal disease.

Herbert Fox, Pennsylvania State Department of Health, tumors from animals at the zoological garden.

J. N. Busch, Henry Phipps Institute, Philadelphia, cultures of microorganisms from tuberculous lungs.

J. A. Kelley, Polyclinic Hospital, Philadelphia, series of gynecologic specimens.

Randle C. Rosenberger, Philadelphia General Hospital, specimens illustrating diseases of the heart.

Leo Loeb, University of Pennsylvania, specimens showing experimental deciduomata.

Edward M. L'Engle, Medico-Chirurgical College, Philadelphia, gastrointestinal series.

D. P. Pfeiffer, German Hospital, Philadelphia.

J. A. Moore, St. Mary's Hospital, Philadelphia.

Philadelphia Roentgen Society, under the direction of Dr. Charles Lester Leonard, an exhibit relating to the diagnosis of thoracic, abdominal and bone lesions.

The following will show plates:

M. K. Kassabian, C. L. Leonard, S. L. Feldstein, S. M. McCollin, W. S. Newcomet, W. F. Manges, H. K. Pancoast and G. E. Pfahler, J. M. Swalm, C. B. Longenecker, American Oncologic Hospital.

Edward A. Schumann, Gynecean Hospital, series of extrauterine pregnancies.

E. M. Meter, Reading, Pa., radiograms.

Ross McPherson and J. E. Welch, New York Lying-In Hospital; William S. Bainbridge, Skin and Cancer Hospital; Simon Flexner, Rockefeller Institute; James Swing, Cornell University Medical School; New York Board of Health; Dr. R. M. Pearce, Bellevue Medical School; New York Post-Graduate Medical School; Charities Association, Tuberculosis Exhibit.

Dr. Emil C. Beck, Chicago, stereoscopic radiographs of the chest. Dr. Jose L. Hirsch, Baltimore, specimens in the name of the University of Maryland.

A. W. Crane, Kalamazoo, x-ray plates illustrating cancer of the stomach.

Louis B. Wilson, Rochester, Minn., photographs showing relation of gastric ulcer and cancer, from laboratories of William and Charles Mayo.

TUBERCULOSIS EXHIBITS: New York Charities Association; New York State Department of Health, by A. N. Seymour; Connecticut State Department of Health, by Gardner T. Swartz; Maryland State Department of Health, by Marshall Langton Price; Indianapolis Medical Society.

It is recommended that a committee of three be appointed by the President to pass on awards for medals and certificates of honor.

It is recommended that the usual appropriation be made for maintenance and for medals and certificates of honor.

Appeal to the human eye in the commercial world has always been the chief means of attracting those who have money to spend. Artistic arrangement of articles in shop windows and show cases always acts suggestively to a prospective purchaser. This really is the exhibit idea. It has been elaborated in modern times in expositions, fairs, and the like. The modern commercial world likewise appeals with extraordinary effect to the public through advertising. Inartistic but striking advertisements stare us in the face as we travel, glare at us in the street car, and distract our attention from readable matter in the daily paper, so that, whether we will or not, we become familiar with peruna, quaker oats, and bull durham tobacco.

It seems strange, indeed, that this principle should not have been more generally applied in the dissemination of educational knowledge among the people. To be sure, in the modern methods of higher education the museum and laboratory have played a conspicuous part. Growing out of this phase of educational work have arisen scientific exhibits, in the inauguration of which this organization has done pioneer service.

In the further evolution of this tendency, health boards and various public-health organizations have instituted exhibits for the enlightenment of the people on sanitary and public-health questions.

Tuberculosis has received widest attention. While excellent, most exhibits have been spasmodic and sporadic. They have been expensive and cumbersome to manage. Maintained for only a few days, but a small proportion of people ever see them. The need is for some means of constantly keeping before the eyes of laymen the tuberculosis problem in all its aspects; to make plain, as Dr. Osler has recently emphasized, that it is a people's problem. Of course, the issuance of propaganda by health authorities, societies and popular lectures relating to the question have greatly enlightened the public mind. But again there is the lack of continuity in the work, and the failure to reach the great mass of the people.

To your Committee it has seemed that there is a demand for a compact but complete tuberculosis exhibit, housed in a substantial case, and suited to permanent installation in public libraries, postoffices, railway stations, etc. A year ago the committee offered a medal, with the hope of developing a model exhibit adapted to this end. No exhibit was presented which was considered sufficiently meritorious to receive the award. The same offer has been repeated this year.

The exhibit idea is capable of great elaboration and practical application in teaching the people the lessons of hygiene and sanitary science. It is a phase of original practical work, to which your Committee has given earnest thought, and which it is hoped to supplement by fruitful results. Public-health exhibits are certain to play an important rôle in the march of preventive medicine. They are a type of advertising in the interest of the public weal.

The Committee, in seeking to stimulate their development, is exceedingly anxious that they should be along sane and judicious lines. On the one hand, they should be attractive, if they are to catch the eye of the public; but on the other hand, they should be dignified, else they will not command the respect of the intelligent and prudent. They should make very plain the great truths it is desired to bring home to the people; they should contain sufficient science to convince the lay mind of the truths which it is sought to inculcate, but not enough to cloy the enthusiasm or direct attention from the great practical lessons.

Your Committee feels that in the field of preventive medicine this Association has a great opportunity—in fact, a duty—to properly poise and direct the evolution of exhibits designed for the enlightenment of the public on sanitary and hygienic questions. Toward the attainment of these ends your aid and cooperation are asked. FRANK B. WYNN, Chairman.

On motion of Dr. W. L. ESTES, Pennsylvania, seconded by Dr. J. W. PETTIT, Illinois, the report was accepted and the recommendations adopted.

The President appointed as Committee on Awards Drs. L. F. Barker, William J. Mayo, and H. A. Christian.

Report of Subcommittee on Carroll Fund

MAJOR IRELAND presented a supplementary report from the Committee on Medical Legislation, in the form of a report of a sub-committee on the Carroll Fund, to the Legislative Committee of the American Medical Association.

To the Legislative Committee, American Medical Association:

The following resolution was passed by the National Legislative Council of the American Medical Association during its meeting at Washington, Jan. 18-20, 1909:

Resolved: That a committee composed of one member of the Army Medical Department, one of the Navy Medical Department, one of the Public Health and Marine-Hospital Service, one member of the District of Columbia Medical Society, and one member to represent the profession at large, members of the Council, be named by the Chairman, and instructed to present to the different medical services of the government, the District of Columbia, and the profession at large the conditions of distress under which the widow of our hero brother, Major James Carroll, is placed, and suggest or help to devise such plan and action as may speedily bring relief.

A. S. VON MANSFELDE, Chairman,
J. E. McDONALD,
JAMES T. GREELEY.

It was moved and seconded that the report be adopted.

The Chair appointed as a committee Dr. A. S. von Mansfelde of Nebraska; Maj. M. W. Ireland, U. S. Army; Surgeon W. H. Bell, U. S. Army; Surgeon John F. Anderson, Public Health and Marine-Hospital Service; Dr. John D. Thomas, District of Columbia.

As soon as the official notification was received from the Secretary of the Committee of the action taken by the Legislative Council the members proceeded in what they considered the best way to raise the necessary funds to save the home of the widow of the late Major Carroll.

The Public Service members of the Committee sent a circular letter to the members of their respective corps, inviting attention to the resolution passed by the Legislative Council, stating the financial distress of Mrs. Carroll and asking for assistance. Dr. John D. Thomas of the District of Columbia had a personal interview with a great many members of the profession in the District of Columbia, and also brought the subject to the attention of the profession through the different societies in the city. Letters appealing to the profession at large were published in THE JOURNAL of the American Medical Association, and an editorial was prepared and published in THE JOURNAL. The subscription list was kept before the profession at large by inserting in the weekly issue of THE JOURNAL the list of those who had subscribed during the preceding week. Through the courtesy of the assistant secretary,

Dr. Green, circular letters were sent to various state societies which were to hold their annual meetings during the months of April and May. A notice in the New York press attracted the attention of several philanthropic people, with the result of one liberal subscription.

The result of the appeal to the profession has been extremely gratifying, and your Committee feels certain that the agencies now at work will secure a sufficient amount of money to raise the indebtedness on the Carroll property during the coming year.

It was found necessary to make certain expenditures from this fund to pay the notes that are falling due on the third of each month: to pay the interest on the \$5,000.00 mortgage on the property, and to pay the taxes to save the property from being sold at public auction. The Chairman of the Committee took the responsibility of meeting these obligations and of making the necessary expenditures to carry on the work of the committee. The total of these expenditures was \$567.02.

The indebtedness on this property to-day is as follows:

Forty-three \$50.00 notes.....	\$2,150.00
One mortgage.....	5,000.00
	\$7,150.00

The amount of money on hand to-day to pay this indebtedness is \$5,700.82, leaving \$1,449.18 to be raised.

The semi-annual interest of \$125.00 on the \$5,000.00 falls due on June 15. Respectfully submitted,

WILLIAM HEMPHILL BELL.

JOHN F. ANDERSON.

JOHN D. THOMAS.

M. W. IRELAND, Chairman.

The report was referred to the Reference Committee on Legislation and Political Action.

Report of Reference Committee on Reports of Officers

DR. ALEXANDER R. CRAIG, Pennsylvania, Chairman, read the report of the Reference Committee on Reports of Officers, as follows:

To the House of Delegates of the American Medical Association:

The Reference Committee on the Reports of Officers begs leave to report that it has had under consideration "The President's Address" of Dr. Herbert L. Burrell, the "Report of General Secretary" and the "Report of the Board of Trustees."

These have all been carefully reviewed and the Committee recommends the following action by the House of Delegates:

I

In order that they may become conversant with the policies formulated by the Board of Trustees, it is suggested to the Board of Trustees that the President and the President-Elect of the Association be invited to be present at the formal meetings of the Board when it meets in the interim between the annual sessions.

II

In order that the Association may become more closely knit together and its various energies be co-ordinated, it is advised that all committees, whether constituted by the House of Delegates or by any of the Sections, be required to act with the advice and under the direction of the Board of Trustees in the intervals between the sessions of the House of Delegates and that the defined policies of all committees and of the sections of the Association shall be approved by the Board of Trustees before being issued to the public as in the name of or under the auspices of the Association. In order that this action may become a part of the law of the Association, the Committee offers the following amendments to the Constitution and By-laws:

PAGE 16.—CHAPTER IX, SECTION I: Add to the section the words "during the intervals between the sessions of the House of Delegates, the Board of Trustees shall supervise the action of committees constituted by action of the House."

PAGE 18.—CHAPTER X, SECTION I: Add to the section the words "any of these committees, acting during the intervals between the sessions of the House of Delegates shall be subject to the Board of Trustees."

III

As the Board of Trustees makes annually appropriations for the expenses incurred by the various standing committees, no action is deemed necessary by your Reference Committee.

IV

As the Board of Trustees now has full authority to consider and act on the advisability of having different individuals elected to the offices of Editor and General Manager of THE JOURNAL and of Secretary of the Association, this Committee recommends that no action be taken in this matter by the House.

V

A special committee has offered a report on the "Regulation of Membership." This report is worthy of serious consideration by this House, but the Reference Committee on Reports of Officers makes no recommendations under this heading, preferring to await the report of the Committee to which the findings of this special committee have been submitted.

VI

This House and the Association at large are to be congratulated that the Board of Trustees are privileged to make so satisfactory a report, and this Committee recommends that a vote of thanks carrying the approbation and commendation of this House be passed in honor not only of the Board of Trustees, but also of the members serving on the various committees, special note being made of the Council on Pharmacy and Chemistry, Dr. McCormack, the staff compiling the American Medical Directory, those responsible for the success of THE JOURNAL, and the editors of the *Archives of Internal Medicine*.

This Committee is advised that with regard to the project of erecting a new building the conditions are as follows:

The money is on hand for the enterprise in the shape of bonds, certificates of deposit in banks drawing interest and cash on hand. The building can be erected without incurring indebtedness and without curtailing the present work of the Association or its committees. The old building can be let for manufacturing purposes, returning a good interest on the money invested.

The building will enable the Association to conduct its business more economically than at present on account of the present necessity of much "overtime" work with double pay, due to the lack of sufficient room. It will provide sufficient space in which to instal the working headquarters of the various councils and standing committees, which is essentially the accomplishment of results. The Association already owns the land on which the building is to be erected.

It is, therefore, recommended that the Trustees be given full authority to proceed in the matter of erecting the proposed building.

On motion of Dr. C. E. Cantrell of Texas, seconded by several delegates, the report was adopted.

Report of the Reference Committee on Miscellaneous Business

DR. T. A. WOODRUFF, Section on Ophthalmology, Chairman, presented the following report of the Reference Committee on Miscellaneous Business:

To the House of Delegates of the American Medical Association:

In view of the fact that Dr. N. S. Davis was the founder of the American Medical Association and as such should be entitled to especial honorable consideration at the hands of this body, your Committee recommends that the American Medical Association appropriate the sum of five thousand dollars (\$5,000) for the purpose of erecting a suitable memorial to his memory, provided that the additional sum of twenty thousand dollars (\$20,000) be collected for this purpose.

This appropriation of five thousand dollars (\$5,000) shall not become available until the twenty thousand dollars (\$20,000) is paid into the committee.

T. A. WOODRUFF, Chairman.

J. H. PIERPONT.

A. M. HUME.

J. D. GRIFFITH.

JOHN CHAMPLIN.

DR. ARTHUR T. McCORMACK, Kentucky, moved that the report be referred to the Board of Trustees, as it involves the appropriation of money (seconded).

DR. R. R. CAMPBELL, Illinois, moved as an amendment that the report be referred to the Board of Trustees, with the recommendation that a three-year limit be imposed for the collection of this \$20,000.

The amendment was seconded and accepted.

DR. H. C. SHARP, Indiana: It seems to me the proper way is for this report to be referred to the Board of Trustees carrying with it the recommendation of favorable action by the House of Delegates as a guide for the action of the Board of Trustees.

DR. C. E. CANTRELL, Texas: This report should naturally take the course of being referred to the Board of Trustees, as it has emanated from a Reference Committee of this House, this committee recommending to the Board that a certain thing be done.

Report of the Council on Defense of Medical Research

To the Members of the House of Delegates of the American Medical Association:

The Council on the Defense of Medical Research was established by vote of the House of Delegates at the Chicago meeting of the American Medical Association in June, 1908. The Council was organized at a meeting in Philadelphia November 7, 1908, with Dr. W. B. Cannon, Boston, as Chairman, and Doctors J. A. Capps, Chicago; Harvey Cushing, Baltimore; D. L. Edsall, Philadelphia; Simon Flexner, New York; Reid Hunt, Washington, and H. C. Moffitt, San Francisco, as members.

The work of the Council during the past year may be classified under three headings—first, investigating the conditions of animal experimentation and the opposition to it; second, taking precautions against abuse of animal experimentation and against misconceptions of the conditions and purposes of medical research; third, diffusing information regarding laboratory procedures and the results of laboratory study of disease.

THE INVESTIGATION OF THE CONDITIONS OF ANIMAL EXPERIMENTATION AND THE OPPOSITION TO IT

In order to obtain information regarding the conditions of medical research in the United States circulars were sent to 111 of the most prominent schools. Reports have come in from 80 of these schools. Among those from which no reply has been received are a number of homeopathic colleges and other institutions in which animals are probably not used. It is likely that in not more than four of the schools that have not reported are animals used for experimental purposes. The information that has been accumulated is, therefore, quite complete.

In the circular questions were asked as to the approximate number of different kinds of animals used per year; the methods of securing these animals; the number of dogs and cats killed in the city merely to get rid of the excess; the care of animals in the medical school, including the ventilation, warmth, cleanliness and lighting of their rooms; whether operations likely to involve pain were always performed with anesthetics; whether students were permitted to carry on independent animal experimentation or were cautioned against it; whether experimental work was conducted under rules, and whether any public hostility to animal experimentation existed in the community.

These questions have been fully answered and the answers will be published in a paper to appear in a series of papers later to be described in this report.

In order to understand the nature of the opposition to medical research the Council has collected antivivisection literature from all the societies in the United States and has subscribed to antivivisection journals. It has, likewise, obtained from a Clipping Bureau the statements for and against vivisection, which have appeared in newspapers and other periodicals throughout the country. An analysis of this literature will be presented, likewise, in a later publication of the Council.

PRECAUTIONS AGAINST ABUSE OF ANIMAL EXPERIMENTATION AND AGAINST MISCONCEPTIONS OF ITS CONDITIONS AND PURPOSES

As much of the "evidence" cited by hostile agitators is taken from articles in journals devoted to the medical sciences, the Council sent a circular letter to the editors of medical and scientific journals urging careful examination of

submitted articles with the purpose of eliminating words likely to cause misapprehension regarding the experience of animals used for research, and especially requesting that authors be asked to make sure that when anesthesia is a condition of the investigation the fact be made prominent. This letter met with cordial response.

Hostile agitators have also declared that irresponsible and untrained medical students operate on animals in private places outside of proper supervision. The evidence for this suggestion has not yet been forthcoming. The Council sought, however, to remove even the slight suspicion thus cast on animal experimentation by advocating that teachers of the medical sciences speak to students concerning the importance of the experimental method in medical research, the suspicion of laymen that animals are not treated humanely in laboratories, the resulting agitation for hostile legislation, the injury to medical science that must result from checking animal experimentation, the desirability that every care be taken to obviate discomfort and pain in using animals for research and instruction, and the urgent necessity that students avoid any act or word that would tend to rouse a feeling against the humane use of animals for educational and research purposes. This letter revealed the fact that already in a very large number of medical schools such advice had been regularly given to students, and that there was no evidence that students failed to realize the great importance of what was said or that they did not obey to the letter the caution which was given them.

The Council learned that in the larger medical laboratories rules had been posted stating the conditions and expressing the spirit in which animal experimentation was to be conducted. The Council collected these rules, summarized and revised them, and sent them to all laboratories which had reported that animal experimentation was carried on within their walls. These rules are as follows:

RULES REGARDING ANIMALS

I. Vagrant dogs and cats brought to this Laboratory and purchased here shall be held at least as long as at the city pound, and shall be returned to their owners if claimed and identified.

II. Animals in the Laboratory shall receive every consideration for their bodily comfort; they shall be kindly treated, properly fed, and their surroundings kept in the best possible sanitary condition.

III. No operations on animals shall be made except with the sanction of the Director of the Laboratory, who holds himself responsible for the importance of the problems studied and for the propriety of the procedures used in the solution of these problems.

IV. In any operation likely to cause greater discomfort than that which the animal shall first be rendered in and shall be maintained in that condition.

Exceptions to this rule will be made by the Director alone and then only when anesthesia would defeat the object of the experiment. In such cases an anesthetic shall be used so far as possible and may be discontinued only so long as is absolutely essential for the necessary observations.

V. At the conclusion of the experiment the animal shall be killed painlessly.

Exceptions to this rule will be made only when continuance of the animal's life is necessary to determine the result of the experiment. In that case, the same aseptic precautions shall be observed during the operation and so far as possible the same care shall be taken to minimize discomforts during the convalescence as in a hospital for human beings.

DIRECTOR OF THE LABORATORY.

These rules have been adopted in a number of new places and the Council hopes that they will be made the regulations for research in all medical laboratories in the United States. Although they probably do not change in any respect the already good conditions under which animal experimentation is conducted, they indicate to newcomers in the laboratories and to interested and intelligent people the intent of the investigators and the precautions which they take against suffering.

THE DIFFUSION OF INFORMATION REGARDING ANIMAL EXPERIMENTATION

The information which the Council has secured has been utilized in enlightening the editors of certain lay publications regarding the conditions of medical research, and also regarding the character of the opposition to it, both in this country and abroad.

The Council has also cooperated with the local research defense societies, especially those of Massachusetts, New York, Pennsylvania and Wisconsin, and also with that of England, in an interchange of information with resulting mutual helpfulness.

In order to forestall the possibility of hostile legislation the Council sent out during the sessions of the legislatures in the various states a circular letter to the deans of medical schools and to the members of the National Auxiliary Committee on Medical Legislation, stating the specific and general objections to such legislation. This letter revealed an

alert body of men scattered through the country who were ready to perform their part in securing to the communities they served the benefits of medical research.

The Council has planned a series of papers, by experts, on the importance of animals in the development of various phases of medical science and practice, to be published primarily in *The Journal* of the American Medical Association, with the hope that thus a body of evidence will be secured which physicians can refer to in case agitation arises in their communities. It is probable that these papers will be reprinted in book form, or as pamphlets, and either placed on sale or distributed in regions where agitation is active.

The series includes the principles of serum therapy, diphtheria and tetanus, meningitis, rabies, smallpox, dysentery and cholera and typhoid fever, plague, tuberculosis, syphilis, tropical protozoan diseases, diseases caused by metazoan parasites, disturbances of internal secretions, the physiology of the circulation, pharmacology, venoms and antivenins, two papers on experimental surgery—surgical technique and aseptic surgery, cancer research, hygiene and sanitary science, including the diagnosis and control of contagious diseases, the economic importance of diseases which have been lessened by animal experimentation, the use of animals in cattle bureaus, the experience of animals in laboratories, the ethics of animal experimentation, the educational value of operations on animals, and the more complex inter-relations of research and practice. The first paper of the series will be published in an early number of *The Journal*.

W. B. CANNON, Chairman. HARVEY CUSHING.
SIMON FLEXNER. REID HUNT.
DAVID L. EDSALL. JOSEPH A. CAPPS.

DR. WALTER B. CANNON, Chairman, requested that the report be accepted as printed.

On motion, the request was granted, and the report was referred to the Reference Committee on Miscellaneous Business.

Pension for Dr. Atkinson

DR. S. S. CROCKETT, Tennessee: I desire to offer the following preamble and resolutions, and move that they be referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The following resolutions have been unanimously adopted by the House of Delegates of the Tennessee State Medical Association, to wit:

Resolved: That the delegates of the Tennessee State Medical Association to the annual meeting of the American Medical Association, to be held in Atlantic City on June next, are hereby instructed to vote for, and to use their earnest efforts to secure an honorarium or pension of not less than \$100 a month for the former secretary of the Association, William Riddle Atkinson, of Pennsylvania, in recognition of his long and faithful services in the interest of the Association:

Therefore, be it
Resolved: By the House of Delegates of the American Medical Association, that it is hereby recommended to the Board of Trustees that an annuity of one hundred dollars a month be given to Dr. William Riddle Atkinson, of Pennsylvania, in consideration of his long, faithful and valuable services to this Association.

The resolutions were seconded by Dr. C. E. Cantrell, Texas.

On motion of Dr. A. T. McCormack, Kentucky, the resolution was laid on the table.

Resolution Endorsing the Plan of the George Washington Memorial Association

DR. WILLIAM H. WELCH, Maryland, introduced the following resolution, which was endorsed by DR. JOHN A. WYETH, New York:

Resolved: That the American Medical Association, assembled in annual session, gives its hearty approval to the plan of the George Washington Memorial Association to raise a fund for the erection in the city of Washington of a memorial building to our first president, which shall furnish a suitable home and meeting place for national and international patriotic, scientific, medical, educational and similar organizations.

The need of such a building is recognized as urgent, as was demonstrated especially by the experience of the recent International Congress on Tuberculosis. At present the larger national and international societies can meet in Washington, if at all, only under most unsatisfactory conditions. The nation's tribute to George Washington could find no more useful and appropriate form of expression than in a building in the capital of the nation dedicated to the service contemplated in the plans of the George Washington Memorial Association.

The resolution was referred to the Reference Committee on Miscellaneous Business.

Draft of Model Law to Regulate the Practice of Medicine

DR. G. WYETH COOK, District of Columbia, offered the following, which was referred to the Reference Committee on Legislation and Political Action:

Resolved: That the Committee on Medical Legislation be and hereby is instructed to prepare and submit immediately to each state and territorial organization forming a part of this Association,

and to each state and territorial medical licensing board, the draft of a model law for the regulation of the practice of medicine, and to obtain from said organizations and boards all possible criticisms, suggestions and advice with respect thereto and with respect to the laws now regulating the practice of medicine in the several states and territories to which said organizations and boards are related.

That said committee be and hereby is further directed to report to the Association at its meeting in 1910 the draft of a model law for the regulation of the practice of medicine, which can be adopted or used as the basis of such legislation by the several states and territories, with a brief in support of the bill so reported.

That said committee be and hereby is empowered to employ counsel at a cost to be fixed by the boards of trustees, to aid it in effecting the bill which it is especially required to report.

Formation of Physicians' Mutual Aid Society

DR. G. MCGOWAN, California, offered the following preamble and resolution:

WHEREAS, The House of Delegates of the Medical Society of the State of California has instructed its delegates to this body to recommend to the American Medical Association the consideration of the formation of a Physicians' Mutual Aid Society, patterned after that of the British Medical Association; therefore we, the aforesaid delegates of the Medical Society of the State of California, do present the following:

Resolved: That the Trustees of the American Medical Association be requested to consider the aforesaid undertaking and report on the same to the House of Delegates.

H. BERT ELLIS,
O. D. HAMLIN,
G. MCGOWAN.

This resolution was referred to the Board of Trustees.

Resolution of Thanks to Dr. Rupert Blue

DR. G. MCGOWAN, California, likewise presented the following with reference to the bubonic plague:

WHEREAS, At a very recent date the United States was threatened with a general invasion of that terrible disease, destructive both to life and to commerce, the bubonic plague, by its having obtained apparently a permanent foothold in California, but more particularly in the city and county of San Francisco, and

WHEREAS, By his diplomatic efforts in obtaining the good will and active assistance of the legislative and commercial bodies and the general public of the State of California, and by effective organization and skillful and tireless application of scientific measures for the discovery and isolation of all cases and the destruction of or suppression of its common mouse, Surgeon Rupert Blue, of the Public Health Service, has deserved and received at the hand of the State of California a resolution of valuable services, its house of delegates has instructed its delegates to the American Medical Association to present to the House of Delegates of the American Medical Association a request for the passage of a similar resolution of thanks and commendation to the said Rupert Blue, surgeon of the Marine-Hospital Service.

H. BERT ELLIS,
GRANVILLE MCGOWAN,
O. D. HAMLIN.

Referred to Reference Committee on Miscellaneous Business.

Communication from the Section on Surgery and Anatomy

DR. JOHN T. BOTTOMLEY, Section on Surgery and Anatomy, presented the following matters, which were, on motion of Dr. Cantrell, referred to the Reference Committee on Sections and Section Work:

Commission on Anesthesia

It is suggested by the Section on Surgery and Anatomy, which I have the honor of representing in this body, that I call to your attention the importance of continuing the work of the Commission on Anesthesia and the need of an appropriation for the continuance of this work.

This is a matter in which the whole profession has a very personal interest, a matter to which we have, perhaps, given less attention in a purely scientific way than our brothers across the Atlantic.

The recent report made to the German Surgical Congress was a splendid piece of work.

The work of the British Commission is equally well known.

We should do our proportionate and fitting share in this country which offers such a tremendous amount of material.

(a) Scientific examination in the way of original research work should be carried on by properly trained men.

(b) Statistics should be gathered and tabulated.

(c) Reported fatal cases should be thoroughly investigated.

(d) Many sub-committees at various centers should be appointed.

This is a work worthy of such an organization as the American Medical Association and the question of granting an appropriation for the continuance is respectfully presented for your consideration.

Name of Section on Surgery and Anatomy

It is suggested by the Section on Surgery and Anatomy that, if it is the pleasure and will of the House of Delegates, the words "and Anatomy" be dropped from the present official title for the following reasons:

(a) The anatomists of the country have a very live organization, composed almost entirely of teaching anatomists and almost all their work is reported to that body. Practically no anatomic communications are made to our Section.

(b) The combination of practicing surgeon and teaching anatomist can be truly said to exist no longer. This was not the fact in the days when the Section was established. The teaching anatomist of today gives his whole attention to his work and has naught to do with practice.

(c) The present title for the above reasons is a misnomer. It is an injustice to the anatomists.

(d) More papers are now offered to the Surgical Section than it can accept. If anatomic communications were offered and accepted, time would be demanded where there is really none to be given.

Vice-Chairmen and Honorary Secretaries

The Section on Surgery and Anatomy presents for your consideration the question of increasing by two the number of Vice-Chairmen and of appointing two honorary secretaries of the larger sections (600 or more members—such as Practice of Medicine, Obstetrics and Diseases of Women, and Surgery and Anatomy).

These Sections are constantly growing. Many men from all sections of the country deserve and should receive some recognition of their zeal and ability. There are not enough active officerships to go around.

The suggested plan would permit the recognition of all parts of the country in the appointment of section officers and we believe would stimulate and increase interest in the work of the sections.

The Patenting of Surgical Instruments

DR. EUGENE C. HAY, Arkansas, offered the following, which was referred to the Reference Committee on Constitution and By-laws:

Resolved: That the clause of the Principles of Ethics, Chapter II, Article I, Section 8, relating to the prohibition of patenting of surgical instruments by members of the medical profession, be changed, omitting surgical instruments from such prohibition.

Name of Section on Cutaneous Medicine and Surgery

The following resolution was read and referred to the Reference Committee on Sections and Section Work:

To the House of Delegates of the American Medical Association:

The following resolution was presented and unanimously carried in the Section on Cutaneous Medicine and Surgery:

Resolved: That it is the sense of this Section on Cutaneous Medicine and Surgery that in the event a Section on Urology is established, it should not specifically include syphilis:

That, while syphilis more nearly belongs to dermatology than to any other specialty, it is a constitutional disease, which is an important part of many specialties, it certainly does not belong peculiarly to urology.

The General Secretary read a communication inviting the Association to hold its next annual Session in St. Louis.

Dr. G. MacGowan, California, extended an invitation to the House for the Association to hold its next annual Session in Los Angeles.

Those invitations were referred to the Committee on Transportation and Place of Session.

Report of Reference Committee on Hygiene and Public Health

The Committee on Hygiene and Public Health, to which was referred the report of the Special Committee on Ophthalmia Neonatorum, recommends approval of the organized efforts suggested for the prevention and control of ophthalmia neonatorum and regards the excellent and exhaustive work shown in the report as worthy of especial commendation.

Improvement of Status of Personnel of U. S. Public Health and Marine-Hospital Service

The General Secretary read the following, which was referred to the Reference Committee on Legislation and Political Action:

Resolved, That the Association respectfully recommends to the United States Senate and House of Representatives the enactment of legislation for the improvement of the status of the personnel of the Public Health and Marine-Hospital Service, so that it will be put on a parity as to compensation, with the other medical services of the government.

On motion of Dr. R. R. Campbell, Section on Cutaneous Medicine and Surgery, the House then adjourned until 2 p. m., Wednesday.

Fourth Meeting, Wednesday, June 9

The House of Delegates met at 2 p. m., and was called to order by the President.

On motion of Dr. Cantrell, the roll-call was dispensed with. The minutes were read, amended and then approved.

THE PRESIDENT: The Chair yesterday overlooked putting the motion to refer the Report of the Reference Committee on Miscellaneous Business in regard to the Davis Memorial to the Board of Trustees. We will now take this matter up.

It was moved, seconded and carried that this matter be reconsidered.

It was then moved and seconded that the Report of the Reference Committee on Miscellaneous Business, regarding the Davis Memorial, be referred to the Board of Trustees, with the recommendation that a three-year limit be imposed for the collection of this \$20,000. Carried.

DR. H. BERT ELLIS, California, Chairman, presented an additional Report from the Committee on Credentials.

Report of Committee on Sections and Section Work

DR. J. HENRY CARSTENS, Section on Obstetrics and Diseases of Women, presented the following Report of the Reference Committee on Sections and Section Work:

Your committee begs leave to report that the request of the Section on Surgery and Anatomy to strike out the latter part of the name be granted, and that hereafter it be known as "Section on Surgery."

It was moved, seconded and carried that this be adopted.

That the name of the Section of Cutaneous Medicine and Surgery be changed to "Section on Dermatology."

It was moved by Dr. Carstens, and seconded by Dr. Cantrell, that this be adopted. Carried.

Your committee, furthermore, reports in reference to the question of anesthesia, we recommend that the President of this Association appoint a special committee on anesthesia to be composed as follows: One member of the Section on Surgery, one member of the Section on Obstetrics and Gynecology, one member of the Section on the Practice of Medicine; one member of the Section on Ophthalmology; and one member of the Section on Pharmacology and Therapeutics.

That this report be referred to the Board of Trustees with the request that funds be appropriated to carry on the necessary original investigations.

It was moved, seconded and carried that this be adopted.

Your committee further reports that a Section on Urology and Venereal Diseases be created when one hundred members of the Association petition for the same.

All of which is respectfully submitted.

J. H. CARSTENS, Chairman.

On motion this report was adopted.

Report of the Reference Committee on Legislation and Political Action

DR. WALTER B. DORSETT, Missouri, Chairman, presented the Report of the Reference Committee on Legislation and Political Action, which was adopted section by section:

The Report of the Committee on Legislation, which was referred to this committee, contains the report of progress in the various fields of their activity and shows a most commendable work and deserves the hearty support and cooperation of the House of Delegates and the entire membership of the Association.

The following recommendations, in our opinion, should be emphasized and endorsed by the House of Delegates.

NATIONAL PUBLIC HEALTH DEPARTMENT

Resolved, That the American Medical Association re-affirms its previously and repeatedly declared attitude in favor of the organization of all existing national public health agencies, into a single national public health bureau, and that it hails with satisfaction the assurance of President Taft, that he will recommend legislation, looking to that end.

AMENDMENTS TO THE NATIONAL FOOD AND DRUGS ACT

Resolved, That the American Medical Association respectfully urges on the Congress the necessity of amending the National Food and Drugs act, in the following particulars, viz.,

1. To prohibit, absolutely and unqualified, the use of benzoate of soda and similar preservatives in the preparation and preservation of foods destined for interstate commerce.
2. To provide for a system of federal inspection of all establishments engaged in the preparation of foods destined for interstate commerce, such inspection having for its special object (a) the enforcement of sanitary cleanliness in such establishments; (b) the prevention of employment in them of persons afflicted with contagious or infectious diseases; (c) the prohibition of the use of preservatives such as the benzoate of soda; and (d) the prevention of the admission into interstate commerce of unclean and offensive waste products which now, by the use of such preservatives are branded as food stuffs and sold as such to the people.

Resolved, That the Association respectfully recommends to the United States Congress the enactment of legislation for the improvement of the status of the personnel of the public health and Marine-Hospital Service as set forth in Senate Bill 1968.

NAVY DEPARTMENT BILLS

Resolved, That the American Medical Association cordially approves and urges the prompt enactment into law of measures relating to the Navy Department as follows:

1. The Bill "To reorganize and increase efficiency of the Hospital Corps of the United States Navy." (Senate 1017; House 6184; Sixtieth Congress.)
2. The Bill "Authorizing the appointment of Dental Surgeons in the Navy." (Senate 1015; House 6741; Sixtieth Congress.)
3. A Measure to provide for a Medical Reserve Corps of the Navy in accordance with the clause relating to that subject in the Navy Appropriation Bill for 1908.
4. A Measure to provide for two Hospital Ships for the Navy at a cost not to exceed \$3,000,000.

CONFERENCE ON UNIFORM STATE MEDICAL PRACTICE LAW

Resolved, That the American Medical Association cordially approves the proposition advanced by the Committee on Medical Legislation to call a general conference to be devoted to the discussion of the essentials of a uniform medical practice act of the States, such conference to consist of,

- (a) The Committee on medical legislation,
- (b) The national legislative council,
- (c) The Council on Medical Education of the American Medical Association,
- (d) All officers and members of State examining boards,
- (e) All members of State committees on medical legislation,
- (f) Representatives of all Medical Colleges, and
- (g) and such other persons as the Committee may see fit to invite.

This recommendation covers the suggestion in the resolution offered by Dr. George W. Cook of District of Columbia.

The effort of the Legislative Committee to raise funds for the relief of the families of those who have died in the medical service of the country is hereby indorsed and all members of the American Medical Association are urged to contribute.

This committee approves the action, already taken, of the Committee on Medical Legislation for the relief of Mrs. Carroll.

It recommends the efforts of the committee in the direction of uniform food and drug legislation, and urge continuance until all states adopt practically the same laws. It also endorses the efforts of the Bureau on Medical Legislation toward the adoption of uniform state laws on vital statistics.

Report of the Committee on Patents and Trademarks

This committee has done a large amount of work and gathered much useful information on this complicated subject, yet wisely refrains from any recommendation of specific action by the House of Delegates at this time, but suggests that further investigation be made to ascertain if anything can be done to correct existing abuses.

The committee recommends that the present committee be continued for another year. It also recommends that the resolutions by Dr. Ireland concerning the use of the Geneva Red Cross as our insignia and the resolution of Dr. Samuel Wolfe, of Pennsylvania, concerning the selection of a suitable one for this association be referred to a special committee of five to be appointed by the President, who shall report at the next annual meeting.

While fully appreciating the magnitude of the work done in San Francisco and the skill with which it was executed, your committee considers that it is not desirable to single out any one officer for special mention, no matter how distinguished his service may have been.

On motion, the report was adopted as a whole.

Report of Reference Committee on Hygiene and Public Health

The following report was presented by Dr. G. B. Young, U. S. P. H. and M.-H. S., a member of the Reference Committee on Hygiene and Public Health:

The Committee on Hygiene and Public Health, to which was referred the Report of the Special Committee on Ophthalmia Neonatorum, recommends approval of the report and of the organized efforts suggested for the prevention and control of Ophthalmia Neonatorum, and regards the excellent and exhaustive work shown in the report as worthy of especial commendation.

It also recommends cooperation on the part of state and municipal boards of health and other authorities in securing the widest dissemination of the facts and recommendations presented by the committee by publication and otherwise.

It further recommends that the committee be continued.

WILLIAM N. WISHARD, Chairman.

O. J. BROWN.

G. B. YOUNG.

On motion of Dr. G. L. Taneyhill, Maryland, seconded by Dr. Charles S. Bacon, Illinois, the report was adopted.

Report of Reference Committee on Amendments to Constitution and By-Laws

DR. H. WORK, Colorado, Chairman, presented the following report of the Reference Committee on Amendments to the Constitution and By-Laws:

To the House of Delegates of the American Medical Association:

The Reference Committee on Amendments to the Constitution and By-Laws, begs leave to recommend that on page 16, Chapter IX, Section 1, the following amendments be made:

Add to the section the words, "during the intervals between the sessions of the House of Delegates, the Board of Trustees shall supervise the action of committees constituted by action of the House."

On page 18, Chapter X, Section 1, add to the section the words, "any of these committees, acting during the intervals between the sessions of the House of Delegates, shall be subject to the Board of Trustees."

It also recommends the continuance of the Committee on Uniform Regulation of Membership, consisting of Thomas McDavitt, Walter Steiner, and Frederick R. Green, and that the personnel of this committee be increased to seven by the appointment of four additional members who are secretaries of state medical societies.

That this committee be instructed to formulate and report back recommendations relating to matters of discipline in county and state societies at the next annual meeting.

Your committee would also urge that this House of Delegates recommend to its constituent county and state societies that the fiscal society year be made to correspond with the calendar year for the purpose of securing uniformity and simplifying the keeping of accounts of the Association.

Respectfully submitted,

J. SHELTON HORSLEY.

F. PASCHAL.

FLOYD M. CRANDALL.

GEORGE W. GUTHRIE.

HUBERT WORK, Chairman.

On motion, the report was adopted.

Report of Reference Committee on Miscellaneous Business

DR. THOMAS A. WOODRUFF, Section on Ophthalmology, Chairman, read the report of the Reference Committee on Miscellaneous Business. The report was considered section by section and adopted:

PHYSICIANS' MUTUAL AID ASSOCIATION

Your committee respectfully recommends that the House of Delegates refer back to the California State Medical Association the resolution relative to the Physicians' Mutual Aid Society for more definite plans of purpose as the committee has no data on which to formulate an intelligent report.

REPORT ON THE REPORT OF THE COMMITTEE ON SCIENTIFIC RESEARCH

Your committee, recognizing the valuable work done by the Committee on Scientific Research and the results already accomplished, recommends that their request for a yearly appropriation of \$1,000 be granted.

GEORGE WASHINGTON MEMORIAL ASSOCIATION

With reference to the resolution endorsing the plan of the George Washington Memorial Association, your committee recommends that said resolution be approved.

COMMITTEE ON NOMENCLATURE AND CLASSIFICATION OF DISEASES

The Committee on Nomenclature and Classification of Diseases is to be congratulated on the excellence of the work contained in their report. The report indicates that a careful study has been made of all the proposed changes, and it is recommended that the suggestions offered be concurred in, and that the committee be continued, and that the Board of Trustees be asked to appropriate the necessary funds for the continuance of the work of the committee.

THOMAS A. WOODRUFF,

ARTHUR M. HUME,

J. H. PIERPONT,

J. D. GRIFFITH,

J. CHAMPLIN.

Report of Reference Committee on Reports of Officers

DR. ALEXANDER R. CRAIG, Pennsylvania, presented the report of the Reference Committee on Reports of Officers, as follows:
To the House of Delegates of the American Medical Association:

The report of the Committee on Organization and the address of the President have been referred to the Reference Committee on Reports of Officers and have been considered by that committee. The Reference Committee now reports to the House that the report made by the Committee on Organization is, in their judgment, so clear and comprehensive as to leave nothing for this House to do other than to approve the report.

In the address of the President there is but one suggestion to the House, and that is the matter of the erection in the National Capitol of a memorial to medical officers who gave up their lives during the War of the Rebellion.

The Reference Committee recommends that this movement be endorsed by the House and that there be appointed by the President of the Association a central committee of five members; that this committee be empowered to appoint a general committee, adding to their number of five one from each state and territory and the District of Columbia, and one from the regular army, one from the navy and one from the Public Health and Marine-Hospital Service; and, in addition, two honorary chairmen are to be appointed by the President of this Association.

It is recommended that the Board of Trustees be requested to appropriate to the use of this committee a sum not to exceed one hundred dollars, which sum or such part thereof as shall have been used by the committee, shall be returned to the Association when the subscriptions obtained by the committee shall amount to five hundred dollars.

On motion the report was adopted.

Report of the Director of Postgraduate Study

The report of the Director of Postgraduate Study was then presented as follows:

To the Members of the House of Delegates of the American Medical Association:

I have the honor to submit the following report of the progress of the work of the course of postgraduate study during the past year.

As stated in the report of one year ago, the outline of study for the second year was issued in one pamphlet instead of two, and consisted of ten months rather than twelve, as the first year. This provides for a vacation of two months each year, which is desired by most societies. The first edition of the outline, 5,000 in number, was printed in blank form, making an 80-page pamphlet. Most societies used this by filling in the time and dates of meetings and the names of teachers for the different topics; however, several societies desiring a large number of outlines, had them printed by *The Journal*. There was distributed with this blank outline a pamphlet describing the plans and details of the course and giving suggestions as to the use of the outline in the society or as a reading course of home study.

The plan for the second year, to begin the first of September, was carried out by beginning the distribution of the outlines the middle of August, and printing in *The Journal* each week the elaboration of the topics for the weekly meeting two or three weeks hence.

The first edition of 5,000 was completely exhausted in five months, requiring a new edition by the first of February, 1909. In this new edition the descriptive pamphlet mentioned above was printed with the outline, making one pamphlet rather than issuing them separately as was done before. This edition consisted of 4,000 outlines in blank form and 1,000 of the regular Warren County, Kentucky, program for the second year. It was found as a practical matter the first year that those not familiar with the course of study could understand it much more readily by having a complete program at hand, so this year the Warren County programs are regularly distributed with the blank outlines.

It is gratifying to report the interest that has been shown in the course, the number of societies that have taken it up this year, 200, being double that of last year. We note that about 85 per cent. of the societies which followed the course last year have taken it up again this year, showing that they feel that the time and study expended have been worth while. Many secretaries have written to attest the social, scientific and financial benefits to be derived from a closer personal association in the meetings.

As to the new societies interested in the work, several of them mention the fact that it has been brought to their attention by the outlines appearing in *The Journal*, or in one

of the State journals, but by far the greater number of requests have come directly from the societies visited by Dr. J. N. McCormack, showing that one familiar with the work and its possibilities is best able to arouse an interest and enthusiasm in it. It may be mentioned further that many Councilors, particularly those visited by Dr. McCormack, have been able to inaugurate the work in quite a number of societies.

The adaptability of the course to the needs of the large society as well as the small one is shown by the fact that many societies in the larger towns and cities, even in some of the medical teaching centers, have been using the outline in the regular society work, following the weekly and monthly programs.

It is worthy of note that those states doing the most work last year, viz., Pennsylvania, Indiana, West Virginia and Kentucky, are again showing the greatest increase in the number of societies following the course. It may also be mentioned that the requests for the literature have not been confined to the states but have come from Panama, Canada, and China as well. Quite a number of individuals have been using the outline as a guide in a reading course of study when on account of distance and for other reasons they were unable to attend the regular meetings.

The outline for the third year is now in preparation and will soon be ready for the printer, so that it may be distributed by the first of August, thus allowing societies to take up the third year of the cycle by the first of September.

The progress of the work during the year indicates that the course of study is in many societies meeting the needs fully, bringing the members of the profession together in a way that will lead, by mutual understanding and cooperation, to the greatest benefits possible. If this particular line of work is to be a real factor in the organization and education of the graduate physician of the country as is desired by the Department of Organization, and if a suggestion on the part of the director is permissible, it would be that men experienced in this course of study be requested to visit other societies and aid in the inauguration of the work, as was mentioned in the report of last year. Very respectfully,

JNO. H. BLACKBURN, Director.

On motion, the report was accepted as printed.

Supplementary Report of the Committee on Organization

DR. J. N. McCORMACK, Kentucky, read a supplementary report of the Committee on Organization, as follows:

To the House of Delegates:

Your committee, to which was referred the preamble and resolution of Dr. W. H. Sanders [presented at the Chicago session, 1908, see reprint page 34], looking to the creation of a committee to revise the constitution and the forms of by-laws of this association, the state associations and the county societies, for the purpose of securing a more uniform, complete and coherent organization of the entire profession, has carefully considered the same in connection with the report made yesterday by the Committee on the Uniform Regulation of Membership, and respectfully recommends that this entire subject be referred to this committee to which shall be added five members, four of whom shall be secretaries of state associations, to be selected by the President, and that this enlarged committee be charged with the work of revision indicated by Dr. Sanders and suggested by the committee above mentioned.

On motion of Dr. Arnold the report was adopted.

Report of the Committee on Triennial Reapportionment

DR. J. F. PENCY, Illinois, chairman, read the report of the Committee on Triennial Reapportionment, as follows:

The membership of the American Medical Association in 1906 was 58,859. The membership in 1909 was 67,332. A gain, up to May 1, 1909, of 8,473.

The Constitution provides for a maximum membership in this House of Delegates of 150. On a basis of 650 the constituent state societies are given 133 delegates, divided as follows:

	Delegates				
	1906.	1906.	1909.	600.	650.
Alabama	1,370	3	1,650	3	3
Arizona	104	1	120	1	1
Arkansas	766	2	910	2	2
California	1,733	3	1,861	4	3
Colorado	716	2	729	2	2
Connecticut	750	2	872	2	2
Delaware	104	1	103	1	1
Dist. of Columbia..	484	1	540	1	1
Florida	281	1	285	1	1

Respectfully submitted,

J. F. PERCY, Chairman,
E. J. GOODWIN,
O. J. BROWN,
G. H. SIMMONS.

On motion, the report was adopted.

Report of the Board of Trustees to the House of Delegates on the Report of the Board of Public Instruction on Medical Subjects

DR. WILLIAM H. WELCH, Maryland, Chairman, presented the following report of the Board of Trustees on the report of the Board of Public Instruction on Medical Subjects:

We desire to express our appreciation of the value of the work thus far undertaken by the Board of Public Instruction on Medical Subjects, as outlined in its report, and of the importance of the field covered by this board. We recognize that unusual difficulties attend the complete development of a satisfactory plan to instruct the public in fundamental matters relating to individual and public health, but the object to be attained is worthy of the best efforts of the profession. The general plan of procedure contemplated by the board, so far as it has been developed, seems to be commendable. We believe that the establishment of the Auxiliary Board and the efforts to secure the cooperation of State and County Societies give promise of increased usefulness to the activities of the Board. We commend especially the plan to render available to these societies, as well as to appropriate committees and individuals, suitable pamphlets and literature which will be of service for distribution for the preparation of courses of popular lectures, and similar purposes. It is the desire of the Trustees to en-

courage and support the work of the Board of Public Instruction in the future, as we have done in the past. At the February meeting of the Board of Trustees the amount then asked for by the Board of Public Instruction, namely, \$2,000, was granted.

WILLIAM H. WELCH, Chairman.

It was moved, seconded and carried that the report be adopted.

The Report of the Committee on Awards in the Scientific Exhibit

Your committee recommends that the following awards be made:

1. Diplomas of Honor for exhibits of superior merit.
 - (a) American Pharmaceutical Association.
 - (b) Dr. Emil Beck.
 - (c) Jefferson Medical College.
 - (d) Laboratory of St. Mary's Hospital, Rochester, Minn.
 - (e) Philadelphia Roentgen Ray Society.
 - (f) University of Maryland.
 - (g) University of Pennsylvania.
 - (h) Philadelphia Polyclinic.
 - (i) Hartford Association for Prevention of Tuberculosis.
 - (j) New York Charity Organization Society.
 2. Gold Medal for best exhibit of research work.
 - (a) New York Lying-in Hospital.
 3. Gold Medal for best tuberculosis exhibit according to specifications.
 - (a) Indianapolis Medical Society.
- Honorable mention is made of the excellent exhibit of the New York State Department of Health.

Respectfully submitted,

Committee, LEWELLYS F. BARKER, Chairman,
WILLIAM J. MAYO,
HENRY A. CHRISTIAN.

On motion, the report was adopted.

Amendment to the By-Laws

The following amendment to the by-laws was introduced by Dr. C. L. Wheaton, Section on Hygiene and Sanitary Science:

The Council on Public Health shall consist of five members. One member shall be elected to serve for one year, one for two years, one for three years, one for four years and one for five years. Thereafter, one member shall be elected each year to serve five years. The Council shall organize, shall elect a Chairman and Secretary and shall adopt such regulations for the government of its actions as it deems expedient. It shall expend money or contract financial obligations only as shall be authorized in writing by the Board of Trustees.

The functions of the Council on Public Health shall be:

1. To make such original investigation pertaining to public health subjects as it may deem advisable.
2. To supervise the publication of information relative to sanitary science and public health.
3. To act in an advisory capacity and to cooperate with the public health department in the United States, national, state and municipal, when requested to do so by the proper officers.

On motion these amendments were referred to the Reference Committee on Legislation and Political Action.

Permanent Council on Sanitary Science Requested

The following resolution was introduced by Dr. C. L. Wheaton, Section on Hygiene and Sanitary Science, and was referred to the Reference Committee on Hygiene and Sanitary Science:

Resolved, That the representatives of the Section on Hygiene and Sanitary Science, in the House of Delegates, be instructed to ask that a permanent Council on Sanitary Science be appointed by the American Medical Association; and that a special department on Sanitary Science be regularly maintained in the Journal of the Association, under the supervision of this Council.

Resolved, That the Association be requested to appropriate a suitable sum of money for the use of this Council.

In introducing the above resolutions, Dr. Wheaton stated that they were formulated by a committee of the Section on Hygiene and Sanitary Science, composed of Dr. H. B. Hemmenway, Dr. J. N. McCormack, Dr. H. M. Bracken and Dr. W. A. Evans.

Name of Section on Hygiene and Sanitary Science

The following resolution was introduced by Dr. C. L. Wheaton, Section of Hygiene and Sanitary Science:

DR. WHEATON: The following resolution proposed by Dr. F. A. Knopf of New York, and seconded by Dr. Marshall L. Price, of Maryland, was adopted by the Section on Hygiene and Sanitary Science, and I was instructed to present it to the House of Delegates of the American Medical Association:

Resolved, By the Section on Hygiene and Sanitary Science, that it is the sense of the Section that its name—Section on Hygiene and Sanitary Science—should be changed to that of Section on Preventive Medicine and Public Health.

On motion this resolution was referred to the Reference Committee on Sections and Section Work.

Tuberculous Physicians in Oklahoma

The following resolutions, introduced by Dr. C. L. Wheaton, Section on Hygiene and Sanitary Science, were proposed by Dr. S. A. Knopf and adopted by the Section on Hygiene and Sanitary Science of the American Medical Association.

On motion these resolutions were referred to the Reference Committee on Hygiene and Sanitary Science.

WHEREAS, The Section on Hygiene and Sanitary Science of the American Medical Association has learned with profound regret that the Board of Medical Examiners of the State of Oklahoma have decided no longer to grant licenses to practice to physicians afflicted with tuberculosis, and

WHEREAS, It has been sufficiently demonstrated that the clean, wholesome and trained consumptive is not a menace to his fellowmen, and

WHEREAS, It is well known that the scientific knowledge of tuberculosis has been vastly increased by physicians of the past and present who have been afflicted with tuberculosis, and

WHEREAS, The experience in this country and abroad has furthermore demonstrated that tuberculous physicians, more than any other class, have advanced the best methods of cure of tuberculosis and have been most active in the tuberculosis propaganda, be it

Resolved, That the Section on Hygiene and Sanitary Science of the American Medical Association deeply deprecates the action of the Oklahoma State Board of Medical Examiners whereby tuberculous physicians desiring to practice in Oklahoma are deprived of this privilege because of their illness. Be it further

Resolved, That this Section expresses the profound wish that the State Board of Medical Examiners of Oklahoma will withdraw this restriction and again open its hospitable state to all honorable physicians well qualified to practice though they may be afflicted with tuberculosis.

Amendment to Constitution

DR. ARTHUR T. McCORMACK, Kentucky, offered the following:

Amend Article 4 of the Constitution by adding at the end of said Article, the words, "The House of Delegates, on application, may arrange for the recognition of constituent associations outside of, but adjacent to, the United States.

(To lie over until next year.)

Amendments to the By-Laws, Proposed to the House of Delegates, on June 9, 1909, by the Board of Trustees

DR. WILLIAM H. WELCH, Maryland, presented the following for the Board of Trustees:

A. Repeal Section I of Chapter I, Book I, entitled "Membership—How Obtained," and substitute the following:

"Section 1. Membership—How Obtained.—A member in good standing of the constituent association of the state in which he resides may become a member of the American Medical Association, by presenting to the General Secretary: (1) Satisfactory evidence of the above qualifications; (2) written application for membership on the prescribed form; (3) the payment of the annual assessment and the subscription to THE JOURNAL of the American Medical Association. Commissioned medical officers of the United States Army, United States Navy and United States Public Health and Marine-Hospital Service shall be *ex officio* members; they shall not be required to pay the annual assessment, nor shall they receive THE JOURNAL of the American Medical Association unless on personal subscription."

B. Repeal Section 4 of Chapter I, Book I, entitled "Delinquency—Dues Must Be Paid" and substitute the following:

"Section 4. Delinquency.—Any member who shall fail to pay his annual assessment and subscription to THE JOURNAL for one year, unless absent from the country, shall be dropped from the roll of members, provided that due notice shall be previously given to the member by the General Secretary. Any member who has been suspended for non-payment shall be restored only when all his indebtedness has been paid."

C. In the last line of Section I, Registration, of Chapter II, Book I, substitute for the word "dues" the following: "Assessment and subscription to THE JOURNAL."

D. Immediately following the Section and Chapters of Book IV, insert the following new book and chapter:

"Book V. Assessment and Subscription to THE JOURNAL—Chapter XIV. The annual assessment for membership shall be one dollar; and the price of subscription to THE JOURNAL of the American Medical Association shall be four dollars for members and five dollars for non-members a year."

WILLIAM H. WELCH, Chairman.

On motion of Dr. E. J. Goodwin, Missouri, the amendments were referred to the Reference Committee on Constitution and By-Laws.

Care of Indigent Members

DR. EDWARD JACKSON, Colorado, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The physician disabled by sickness for the practice of his profession, is peculiarly dependent on the savings of earlier years of the assistance of others; yet can not have recourse to the ordinary agencies of charity, be it

Resolved, That the President of the American Medical Association appoint a committee of five members, who shall inquire into the

desirability and practicability of the establishing under the auspices of the American Medical Association of a fund for the assistance of physicians disabled by sickness, and of a sanatorium for the treatment of such members of the association as may be afflicted with tuberculosis or similar diseases; such committee to report to the House of Delegates at the next annual meeting.

Enlightenment of the Public on Hygiene and Public Health

DR. WALTER B. DORSETT, Missouri, introduced the following resolutions, which were referred to the Reference Committee on Hygiene and Public Health:

As it is conceded that the profession generally needs enlightenment on the subjects pertaining to public health and quarantine matters, therefore, be it

Resolved, That it is suggested to the State Societies the advisability of occasionally including in their progress, papers concerning this subject by an officer of the United States Public Health and Marine-Hospital Service; and

Resolved, That the Surgeon-General of the United States Public Health and Marine-Hospital Service be urged to cooperate in this matter by detaching an officer of officers to present papers on the subject to such State Societies as may call on him for such cooperation.

Reorganization of the Judicial Council Proposed

DR. D. C. BROWN, Connecticut, presented the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Two years ago the House of Delegates decided that it was unwise to make the ex-Presidents of the American Medical Association *ex officio* members of the House of Delegates.

Year after year this House elects for the American Medical Association a man of national rank, strong professionally, experienced in the conduct of association affairs, and places him in the one unique position in the Association where he may have a comprehensive grasp of all of its affairs, and just when he has had time to observe the workings of the various branches of organic work and before he has had time and an untrammelled opportunity to utilize the judgments formed by such observation, his term as President expires and the Association is deprived of his services when they are ripest and freed from sectionalism.

In order that this may, to some extent, be obviated without disturbing the representation as at present existing in the House, the following resolution is presented: Be it

Resolved, That the Committee on Amendments to Constitution and By-Laws and the Judicial Council be made one Committee, known as the Judicial Advisory Committee, with its duties as defined in the By-Laws Book 3, Chapter 10, Sections 4 and 11, d, 6; and with the added function, that on request of the House it shall act in joint session with any other Reference Committee, on matters that seem to require it. This Committee to be composed of the five last retiring Presidents of the Association, each year the senior ex-president to be retired and the retiring President added to the Committee. This Committee to be in session or available for session when the House of Delegates is in session, to receive all matters that may be referred to it, to have the privilege accorded to other committees, of the floor of the House during the discussion of any matter presented by them but shall not be entitled to a vote in the House, and shall not be entitled to a seat at any time but as above specified.

Associate Members

DR. H. A. CHRISTIAN, delegate from the Section on Pathology and Physiology, presented a list of men recommended for associate membership, and on motion the recommendation was concurred in.

At a meeting of the Section on Pathology and Physiology, held June 8, 1909, it was moved that the following names be recommended to the House of Delegates for associate membership in the American Medical Association, as investigators in the field of medicine, who are not engaged in the practice of medicine: Simon Flexner, Rockefeller Institute, New York; Yandell Henderson, Yale University; George T. Kemp, Champaign, Ill.

Advance Reports of Officers

DR. JULIUS C. BIERWITH, New York, offered the following resolution:

Resolved, That the General Secretary be requested to send annual reports to officers and committees and the reports of special committees to the officers and members of the House of Delegates and Trustees at least two weeks before the annual meeting.

On motion this was referred to the Board of Trustees.

Payment of Annuities

DR. WILLIAM L. ESTES, Pennsylvania, offered the following preamble and resolution, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, It is of great importance to the American Medical Association to safeguard the expenditure of its funds and carefully scrutinize any movement toward the establishment of any precedent for the payment of pensions or annuities; therefore, be it

Resolved, That no proposition or resolution advocating the payment of a pension or annuity to any member or former member of the Association be established by the House of Delegates without the previous consent and endorsement of the delegation of the State Society to which the proposed beneficiary is or was a member.

On motion, the House adjourned until Thursday, 2 p. m.

Fifth Meeting—Thursday Afternoon, June 10

The House met at 2:30 p. m. and was called to order by the President.

The roll was called.

The minutes were read.

Dr. FRANK BILLINGS, Illinois, was granted permission to insert in the minutes in reference to the Davis Memorial Fund, the amount that is now, June 8, 1909, in the hands of the Davis Memorial Treasurer, \$2,463.11.

Dr. CHARLES S. BACON, Illinois, at the request of the Chairman of the Reference Committee on Legislation and Political Action, asked permission to incorporate Senate Bill 1968, instead of the bill of the Sixtieth Congress, which was specifically named in the report.

On motion, this request was granted.

The minutes, as amended, were then approved.

Election of Officers

The election of officers being in order, the President appointed as tellers Major Ireland, U. S. A., H. D. Arnold, Massachusetts, and J. H. J. Upham, Ohio.

The following officers were nominated, balloted for and duly elected:

President—Dr. WILLIAM H. WELCH, Baltimore, Md.

First Vice-President—Dr. ROBERT WILSON, Charleston, S. C.

Second Vice-President—Dr. CHARLES J. KIPP, Newark, N. J.

Third Vice-President—Dr. ALEXANDER LAMBERT, New York City.

Fourth Vice-President—Dr. STANLEY P. BLACK, Pasadena, Cal.

General Secretary—Dr. GEORGE H. SIMMONS, Chicago, Ill.

Treasurer—Dr. FRANK BILLINGS, Chicago, Ill.

Trustees—Dr. C. E. CANTRELL, Texas (one year, to fill vacancy caused by death of Dr. HAPPEL); Dr. M. L. HARRIS, Chicago, Ill.; Dr. C. A. DAUGHERTY, South Bend, Ind.; Dr. WILLIAM T. COUNCILMAN, Boston, Mass.

At this juncture the President-elect was escorted to the platform by Drs. Arthur T. McCormack and W. W. Grant.

Dr. W. H. WELCH, the President-elect, was received with great applause. He said: I do not wish to interrupt the proceedings. I am glad of the opportunity of thanking you for the great honor you have done to me. It is not an honor which I sought, but it is an honor which I can assure you I appreciate very much. There is no higher honor in the gift of the profession of this country. There is no higher honor that can come to any member of our profession in this country, and I prize it especially on account of the opportunity to continue to serve the Association. I shall eventually enter on my duties as Acting President with no little experience of the needs of this Association, and I need not assure you of the devotion and loyalty which I have for the Association. I consider that this Association has possibilities of development worthy of the highest endeavor of every member of our profession. I know of no nobler work in which any member of our profession can engage than that of furthering the interests of this Association. I thank you with all my heart. (Applause.)

Report of the Committee on Transportation and Place of Session

Dr. M. L. HARRIS, Chicago, Chairman, stated that the committee had received three invitations for the next meeting. One from Niagara Falls, N. Y.; one from St. Louis, and one from Los Angeles, Cal. The one from Niagara Falls was simply a communication from a commercial club, and was not backed up by the profession in any way, and therefore had not received any special attention. The invitation from St. Louis comes from the local medical society, the Missouri State Medical Society, the commercial club, etc., accompanied by reports from hotels as to accommodations, halls for places of meeting, exhibits, etc. The invitation from Los Angeles likewise comes from the local profession, from the State Medical Society of California, and accompanied by reports of hotel accommodations, meeting places, etc.

The committee does not feel that it should assume the responsibility of deciding between these two places, St. Louis and Los Angeles, and that, therefore, the House should decide the matter.

The House of Delegates then took a vote in regard to the selection of place of meeting, with the result that St. Louis was chosen as the place for holding the next annual session.

Standing Committees, Etc.

THE PRESIDENT: Our By-laws provide that the President shall nominate, and the House confirm, members of standing committees.

The Chair would nominate Dr. Charles A. L. Reed to succeed himself on the Committee on Medical Legislation.

On motion of Dr. J. D. Griffith, Missouri, the nomination was confirmed.

THE PRESIDENT: The Chair nominates for the Council on Medical Education, Dr. A. D. Bevan, Chicago, to succeed himself.

On motion of Dr. G. B. Young, U. S. P. H. and M.-H. S., the nomination was confirmed.

THE PRESIDENT: The Chair nominates for the two vacancies on the Board of Public Instruction on Medical Subjects, caused by the expiration of the respective terms of Drs. Howard A. Kelly and L. S. McMurtry, Dr. T. D. Coleman, Augusta, Ga., and Dr. James Ewing, Cornell Medical College, New York.

On motion, the nominations were confirmed.

ASSOCIATE MEMBERS

The following nominations for associate membership were read: From the Section on Hygiene and Sanitary Science, Dr. H. W. Hill, Minneapolis, Minn.; from the Section on Mental and Nervous Diseases, Dr. William A. White, Washington, D. C.

The following dental members were nominated:

Dr. William B. Dunning, New York City.

Dr. Frederick Lester Stanton, New York City.

Dr. Theodore D. Castro, Philadelphia, Pa.

Dr. George N. West, Chicago.

Dr. William C. Fisher, New York City.

Dr. Robert H. Strang, Bridgeport, Conn.

Dr. John E. Nyman, Chicago.

Dr. W. L. Van Buskirk, Scranton, Pa.

Dr. Arthur Zentler, New York City.

On motion of Dr. J. D. Griffith, Missouri, the nominees were elected.

COMMITTEE ON REVISION OF CONSTITUTION AND BY-LAWS

THE PRESIDENT: There are five members to be added to the Committee on Revision of the Constitution and By-Laws. The Chair nominates Dr. W. H. Sanders, Alabama; Dr. J. H. J. Upham, Ohio; Dr. I. C. Chase, Texas; Dr. A. W. McAllester, Jr., Missouri; Dr. B. R. Schenck, Michigan.

On motion, the nominations were confirmed.

COMMITTEE ON ANESTHESIA

THE PRESIDENT: The Chair appoints on the Committee on Anesthesia Dr. James G. Mumford, Dr. W. D. Haggard, Dr. Alexander Lambert, Dr. H. Gifford and Dr. H. C. Wood, Jr.

Report of Reference Committee on Sections and Section Work

Dr. HENRY J. CARSTENS, Section on Obstetrics and Diseases of Women, read the following report of the Reference Committee on Sections and Section Work:

Your committee begs leave to report that the request of the Section on Hygiene and Sanitary Science be granted, and that the name of the Section be changed to "Section on Preventive Medicine and Public Health."

The request of the Section on Surgery, that the Vice-Chairmen be increased by two for each section be granted; hence, hereafter each section is to elect, besides the Chairman, a First Vice-Chairman, Second Vice-Chairman and Third Vice-Chairman.

On motion of Dr. Arthur T. McCormack, Kentucky, the report was adopted.

Membership in the Association for Medical Employés of the Government

Dr. L. M. HALSEY, New Jersey, introduced the following preambles and resolution, which was referred to the Committee on Constitution and By-Laws:

WHEREAS, The District of Columbia Medical Association refuses to admit to its membership medical employés of the United States Government, and

WHEREAS, Many deserving physicians and scientists are, thereby, excluded from entering the American Medical Association by the ordinary channels, and

WHEREAS, The American Medical Association has received officers of the United States Army, Navy, and Public Health and Marine-Hospital Service directly, without passing through the District Medical Association; be it

Resolved, That the Section on Pharmacology and Therapeutics requests the House of Delegates, for the sake of justice and fair play to extend the same opportunities to join the American Medical Association to medical men engaged in scientific work for the United States Government but not in the active practice of medicine as are extended to the commissioned officers of the Army, Navy and Public Health and Marine-Hospital Service.

Supplementary Report of the Reference Committee on Legislation and Political Action

Dr. WALTER B. DORSETT, Missouri, Chairman, presented the following report of the Reference Committee on Legislation and Political Action:

To the House of Delegates of the American Medical Association:

There was referred to your committee the request from the Section on Hygiene and Sanitary Science "that a permanent Council on Sanitary Science be appointed by the American Medical Association; and that a special department on Sanitary Science be regularly maintained in THE JOURNAL of the Association under the supervision of this Council; and that the Association be requested to appropriate a suitable sum of money for the use of this Council."

There appeared before us a committee from the Section on Hygiene and Sanitary Science, the chairman of the Organization Committee and the secretary of the Bureau of Legislation. After a prolonged discussion, it became evident that the subject was very important and somewhat complicated. Your committee is in hearty accord with the desire of the Section on Hygiene and Sanitary Science to increase its influence and activities by providing a permanent body to carry on continuous investigations and assist the boards of health of various states and municipalities in meeting the numerous and important problems of sanitation which are continually arising. On the other hand, it is worthy of careful consideration whether these functions may not be imposed advantageously on some already existing Council or Bureau. Our attention was called to the fact that legislation involves, generally, a long course of preliminary popular education, and hence the functions of the Bureau of Legislation and those of the Committee on Public Instruction are closely allied. Moreover, the duties of the Committee on Organization have become largely those of popular education. Since the duties of the proposed Council on Hygiene and Sanitary Science would be, in part, those of publicity and legislation, it is possible that they might be performed in conjunction with the duties of the other committee, just named, by a Council on Public Health, Publicity and Legislation.

This whole subject should be carefully studied by all committees interested, and your Reference Committee, therefore, has decided to recommend that a committee of five, composed of the chairmen of the standing committees on Medical Legislation, on Public Instruction and on Organization and of two representatives from the Section on Hygiene and Sanitary Science, be appointed to consider the advisability of combining the functions of legislation, public instruction, organization and public sanitation and intrusting them to a permanent Council to be known, perhaps, as the Council on Public Health, Publicity and Legislation, and report to the House of Delegates next year.

On the representations of the committee from the Section on Hygiene and Sanitary Science that there is urgent need that certain work should be undertaken this year, it was agreed to recommend that the Committee on Legislation, through its Bureau, be instructed to cooperate for one year with a committee of three from the Section on Hygiene and Sanitary Science to carry on such work as may be necessary; and further, that the Trustees be requested to appropriate such reasonable sums as may be found necessary to carry on such work; and further, that the report of this work be made at the annual session of 1910.

It is recommended that all questions of policy and procedure relative to legislation not specifically covered by resolutions passed at the present session of the American Medical Association shall be left to the discretion of the Committee on Medical Legislation.

WALTER B. DORSETT,

Chairman Reference Committee on Legislation and Political Action.

On motion, the report was adopted.

Report of Committee on Amendments to Constitution and By-Laws

Dr. H. WORK, Colorado, read the report of the Reference Committee on Amendments to the Constitution and By-Laws, as follows:

To the House of Delegates of the American Medical Association:
Your committee begs leave to report the following amendments to the by-laws of the Association:

(a) Repeal Section 1 of Chapter I, Book I, entitled, "Membership—How Obtained," and substituting the following:

Section 1. Membership—how obtained. A member in good standing of the constituent association of the state in which he resides may become a member of the American Medical Association by presenting to the General Secretary: (1) Satisfactory evidence of the above qualification; (2) written application for membership on the prescribed form; (3) the payment of the annual assessment and the subscription to THE JOURNAL of the American Medical Association. Com-

missioned medical officers of the United States Army, United States Navy and United States Public Health and Marine-Hospital Service shall be members. They shall not be required to pay the annual assessment, nor shall they receive THE JOURNAL of the American Medical Association unless on personal subscription.

(b) Repeal Section 4 of Chapter I, Book I, entitled, "Delinquency—Dues Must be Paid," and substitute the following:

Section 4. Delinquency. Any member who shall fail to pay his annual assessment and subscription to THE JOURNAL for one year, unless absent from the country, shall be dropped from the roll of members, provided that due notice shall be previously given to the member by the General Secretary. Any member who has been suspended for non-payment shall be restored only when all his indebtedness has been paid.

(c) In the last line of Section 1, Registration, of Chapter II, Book I, substitute for the word "dues" the following: "Assessment and subscription to THE JOURNAL."

(d) Immediately following the sections and chapters of Book IV, insert the following new book and chapter:

Book V. Assessment and Subscription to THE JOURNAL.

Chapter XIV. The annual assessment for membership shall be one dollar; and the price of subscription to THE JOURNAL of the American Medical Association shall be four dollars for members and five dollars for non-members a year.

Book V, entitled "Amendments," shall now become Book VI, and Chapter XIV shall become Chapter XV, and Chapter XV shall become Chapter XVI of Book VI, entitled "Amendments."

In Book IV, Chapter XII, Section 2, entitled "Scientific Work," add to the first sentence the words "and such other officers as the Section shall deem advisable," making it to read: "The officers of each Section shall consist of a Chairman, a Vice-Chairman, a Secretary, and such other officers as the Section shall deem advisable."

The resolution submitted to this committee providing:

"That the Committee on Amendments to Constitution and By-Laws and the Judicial Council be made one committee, known as the Judicial Advisory Committee, with its duties as defined in the By-Laws, Book III, Chapter X, Sections 4 and 11, d. 6, and with the added function, that on request of the House it shall act in joint session with any other reference committees on matters that seem to require it.

This committee to be composed of the five last retiring Presidents of the Association, each year the senior ex-President to be retired and the retiring President added to the committee. This committee to be in session, or available for session, when the House of Delegates is in session, to receive all matters that may be referred to it. To have the privileges accorded to other committees, of the floor of the House during the discussion of any matter presented by them, but shall not be entitled to a vote in the House, and shall not be entitled to a seat there at any time, but as above specified.

This resolution attempts to transfer certain duties of two important existing committees to a new committee to be created, vested with similar and additional powers. The membership of this committee is determined years in advance regardless of whether or not the members of this committee may be present at the meetings of the Association or House of Delegates prepared to act. And your committee recommends that it be not adopted.

The resolution also which seeks to create a Council on Public Health and which runs as follows:

The Council on Public Health shall consist of five members. One member shall be elected to serve for one year, one for two years, one for three years, one for four years and one for five years. Thereafter, one member shall be elected each year to serve five years. The Council shall organize, shall elect a Chairman and Secretary, and shall adopt such regulations for the government of its actions as it deems expedient. It shall expend money or contract financial obligations only as shall be authorized in writing by the Board of Trustees.

The functions of the Council on Public Health shall be:

1. To make such original investigations pertaining to public health subjects, as it may deem advisable.

2. To supervise the publication of information relative to sanitary science and public health.

3. To act in an advisory capacity and to cooperate with the public health department in the United States, national, state municipal, when requested to do so by the proper officers.

Inasmuch as the Reference Committee on Legislation and Political Action has had referred to it identical matter, a report on which they have made to this House of Delegates, we return this proposed amendment to the House without action.

The following resolution that the clause of the Principles of Ethics, Chapter II, Article I, Section 8, relating to the prohibition of patenting of surgical instruments by members of the medical profession be changed, omitting surgical instruments from such prohibition, is respectfully returned with the recommendation that it be recommitted by the House of Delegates to the Judicial Council.

The resolution seeking to amend Article IV of the Constitution by adding at the end of said Article the words: "The House of Delegates, on application, may arrange for the recognition of constituent associations outside of, but adjacent to, the United States." The Constitution requires that this resolution lie over for consideration at the next annual meeting.

By action of this House, some changes have been made in the titles of certain sections of the by-laws, and we therefore recommend that the resolutions already passed be considered as carrying with them presentation of the changes in the by-laws that will be necessary to change the titles in the by-laws, and that the General Secretary be empowered to make such changes in verbiage, and such changes only as will make the by-laws accord with the titles of sections as agreed on by this House at this session. Respectfully submitted.

FLOYD M. CRANDALL.

F. PASCHAL.

J. SHELTON HORSLEY.

G. W. GUTHRIE.

HUBERT WORK, Chairman.

On motion of Dr. Alexander R. Craig, Pennsylvania, seconded by Major M. W. Ireland, U. S. A., the report was adopted.

Supplementary Report of the Reference Committee on Reports of Officers

DR. ALEXANDER R. CRAIG, Pennsylvania, Chairman, presented the following supplementary report of the Reference Committee on Reports of Officers:

The Reference Committee on the Reports of Officers asks permission to supplement its report on the "Board of Trustees" by recommending that the following minute, in memory of Dr. T. J. Happel, a member of that board at the time of his death, be spread on the records of this House. The Reference Committee wishes to acknowledge its indebtedness to Dr. Jere L. Crook, who attended Dr. Happel in his last illness, for the tribute which it desires the House to adopt.

The friendship of Dr. Happel is the most cherished possession of those who knew him, the recollection of which will ever be a bright and hallowed spot in their memory. His life was spent in a little town, but his influence was felt throughout the state and country. His attendance at the meetings of this Association was constant. He never missed a meeting of the state association, of which body he was, many years ago, president. In these and other medical organizations with which he was connected his interest and attendance did not wane when his term of office closed. He never failed to contribute to the success of the meetings, and could always be relied on to take an active part in every phase of the meeting.

In Trenton no one would dare question the statement that Dr. Happel was pre-eminently its leading and most valued citizen. For thirty years he served the municipality as alderman, and his influence was constantly exerted for civic righteousness, municipal improvements and for every measure that tended toward the betterment of the community from a sanitary, economic and esthetic standpoint. The little city rests under the shade of row after row of pretty trees, planted by him, has fine water, good lights, beautiful homes, embowered in roses and surrounded with pretty lawns, and its people are refined, cultured, generous, well educated and patriotic.

It was in this environment that Dr. Happel lived his life of self-sacrifice and devotion to his people, who never called to him in vain. Small wonder is it that he was their idol, their exemplar, their ideal of all that a good physician and a cultured Christian gentleman should be.

Dr. Crook bears this personal tribute, the sentiment of which this House indorses: "It was my sad privilege to visit him a number of times during his last illness and to attend his funeral. For two months his friends and former patients took their turn in watching every night at his bedside, and he was nursed tenderly, devotedly and efficiently by his daughter and sons with a constancy and faithfulness beautiful to behold. On that sad day when his body was laid away beneath the flowers he loved so well, the grief of the entire community found expression at the church and cemetery, practically every one attended, business being suspended and every store closed."

Long will his influence be felt in Tennessee and the country. He was an ideal physician, a noble gentleman, a faithful

friend. He embodied in his life and character the highest aims of our profession. His life was a blessing, his memory a benediction.

For and by order of the Committee.

ALEXANDER R. CRAIG, Chairman.

DR. CHARLES S. BACON, Illinois, moved that a standing vote be taken in connection with this report referring to Dr. Happel. Seconded.

DR. W. W. GRANT, Colorado, said he desired to say a few words in regard to his late colleague, Dr. Happel, who served so well on the Board of Trustees. It had been his pleasure to serve with Dr. Happel continuously from the beginning of the reorganization at St. Paul, nine years ago. He thought he voiced the sentiments of the Board and of the members present who were familiar with Dr. Happel's work, that they did not have a more faithful, more honorable, more upright and zealous worker in behalf of the Board and of the Association than their deceased colleague. He died with the uniform respect of the Board of Trustees, with admiration for his work and a loving regard for his memory.

DR. G. W. GUTHRIE, Pennsylvania, moved as an amendment that a certified copy of the report regarding Dr. Happel be sent to his family.

The amendment was seconded and accepted, and carried by a rising vote.

Report of the Board of Trustees of the Printing and Distribution of the Annual Reports of Officers and Committees

DR. W. W. GRANT, Colorado, a member of the Board of Trustees, presented the following:

RESOLUTION OF DR. J. C. BIERWITH OF NEW YORK

The Board of Trustees recommends the adoption of the resolution requesting the General Secretary to send the annual reports of officers and committees and reports of special committees to officers, members of the House of Delegates and Trustees at least two weeks before each annual session of the Association.

WILLIAM H. WELCH, Chairman.

On motion of Dr. Charles S. Bacon, Illinois, the recommendation of the Board of Trustees was concurred in.

Report of the Board of Trustees of the Report Regarding the N. S. Davis Memorial

The Board of Trustees approve the recommendation of the Reference Committee on Miscellaneous Business as amended in the House of Delegates, to the effect that the American Medical Association appropriate the sum of \$5,000 for the purpose of creating a suitable memorial to Dr. N. S. Davis, the founder of the Association, provided that within three years from this date (June 10, 1909) an additional sum of \$20,000 be collected for this purpose, and provided that the form of the memorial be approved by the House of Delegates of this Association.

WILLIAM H. WELCH, Chairman.

On motion, the report of the Board of Trustees was adopted.

Report of the Board of Trustees on the Proposal to Consider the Formation of a Physicians' Mutual Aid Society

RESOLUTION OF THE DELEGATES OF THE MEDICAL SOCIETY OF THE STATE OF CALIFORNIA

The Board of Trustees desires further information concerning the plan of organization and operation of the suggested Physicians' Mutual Aid Society before expressing a definite opinion concerning this proposal.

With its present information, the Board is of the opinion that the formation and conduct of such societies are a matter of state and local concern rather than an affair of the National Association.

WILLIAM H. WELCH, Chairman.

On motion of Dr. Charles S. Bacon, the report of the Board of Trustees was adopted.

Report of Committee on Miscellaneous Business

DR. THOMAS A. WOODRUFF, Section on Ophthalmology, Chairman, presented the following report of the Committee on Miscellaneous Business:

To the House of Delegates of the American Medical Association:

Regarding the resolution to safeguard the expenditure of funds for pensions, annuities, etc., your Committee recommends that no action be taken in this matter at the present time by the House of Delegates.

The Committee recommends that the President of this Association appoint a committee of five members to inquire into the desirability and practicability of the establishing under the auspices of the American Medical Association of a fund for

the assistance of physicians disabled by sickness, and of a sanatorium for the treatment of such members of the Association as may be afflicted with tuberculosis or similar diseases, such committee to report to the House of Delegates at the next annual meeting of the Association.

On motion of Dr. R. S. Cathcart, South Carolina, seconded by several, the report was adopted.

Education of the Public in Preventive Medicine

On motion of Dr. Arthur T. McCormack, Kentucky, the unanimous consent of the House was obtained in order that Dr. Charles A. L. Reed might introduce the following preambles and resolutions, coming from the Section on Hygiene and Sanitary Science:

WHEREAS, The American Medical Association, not only as one of its declared purposes, but by numerous lines of activity, many of them connected with the Section on Hygiene and Sanitary Science, stands committed to the education of the public with respect to the nature and prevention of disease, and

WHEREAS, The demand for such popular education with respect to tuberculosis, cancer, typhoid fever and other declimating diseases has become urgent; therefore, be it

Resolved, That all county, district and other local medical societies be and they are hereby requested to hold annually one or more open meetings to which the public shall be invited and which shall be devoted to a discussion of the nature and prevention of disease and to the general hygienic welfare of the people.

Resolved, That the women physician members of the American Medical Association, be and they are hereby requested to take the initiative individually in their respective associations in the organization of educational committees to act through women's clubs, mothers' associations and other similar bodies, for the dissemination of accurate information touching these subjects among the people and that they be requested to submit to the House of Delegates a yearly report of such work, and elect from among their number a committee to take charge of the same.

It was moved by Dr. Reed that the resolutions be adopted. Seconded and carried unanimously.

Message of Sympathy to Dr. Burrell and Dr. E. Marvel

Dr. Arthur T. McCormack, Kentucky, moved that the Secretary and President send a telegram to the retiring President, Dr. Burrell, regretting his inability to attend this meeting on account of illness, and expressing the hope that he would soon be restored to general good health.

The motion was seconded by Dr. Cantrell, Texas, and carried.

Dr. L. M. Halsey, New Jersey, moved that the Secretary be instructed to send a letter of sympathy to Dr. Emery Marvel, Chairman of the Entertainment Committee, with hopes for a speedy recovery.

Seconded and carried.

On motion of Dr. Alexander R. Craig, Pennsylvania, the work of the Committee on Organization was commended and the Committee continued.

New Business

By unanimous consent of the House of Delegates the following new business was introduced:

RESOLUTION OF THE SECTION ON HYGIENE AND SANITARY SCIENCE PRESENTED BY DR. C. L. WHEATON.

WHEREAS, The largest undertakings of medicine are in the field of prevention and the status of medicine in public esteem depends mainly on the performance of medical men in this field, and

WHEREAS, The essential numerical data of preventive medicine are wanting for the largest part of the United States, in respect to both area and population, and

WHEREAS, The want of vital statistics is on one hand regularly denounced by men of other sciences as the chief reproach of public medicine; and on the other hand regularly offered by medical men in apology for poor performance, and

WHEREAS, The relations of the Government of the United States with other civilized nations, include both general implication and overt profession that the Government of the United States is both desirous and able to receive and to give official accounts of births, deaths and communicable diseases, and

WHEREAS, The Kingdom of Italy has twice addressed notes to the Government of the United States, alleging that the United States has failed to comply with the stipulations of Article XVI of the Consular Convention of May, 1878, in which the Government of the United States and the Kingdom of Italy agreed, each to furnish the other official records of deaths, and

WHEREAS, The Government of the United States was unable in 1878, and in 1909, still remains unable to fulfill any such international obligations whether express obligations, as in the case of Italy, or implied obligations, as in every case when our foreign relations are with civilized peoples, and

WHEREAS, The duty of systematic registration of births and deaths belongs to the Sovereign States, and not to the Federal Government, and

WHEREAS, The non-performance of this duty has led to definite allegations affecting the honor of the country in foreign relations, is a major delinquency in state government, and is an affectual barrier against progress in state medicine; therefore, be it

Resolved, That the Executive Officers of the American Medical Association, be and are hereby requested to take such steps as are necessary: First, to inform the Government of the United States and the Governors of the several states, concerning the great importance of that delinquency which is partly exposed by the allegations of the Kingdom of Italy concerning the non-performance of the stipulations of Article XVI of the Consular Convention of

May, 1878; second, to cooperate with the Bureau of the Census, with the official bodies of the several states, and with the various unofficial bodies having interests in this subject, to the end that the practice of registration of Vital Statistics may be extended with all speed to cover the whole area of the United States.

Moved by JOHN S. FULTON.

Seconded by MARSHALL L. PRICE.

On motion, the preambles and resolutions were referred to the Committee on Medical Legislation.

WHEREAS, The Section on Hygiene and Sanitary Science has passed a resolution calling on the American Medical Association to take whatever steps are necessary to make the registration of vital statistics complete, for the whole area and population of the United States, which resolution being hereto attached, is hereby made a part of the preamble to this resolution; therefore, be it

Resolved, By the House of Delegates of the American Medical Association, that this request of the Section on Hygiene and Sanitary Science, shall be complied with.

On motion of Dr. Craig, the resolutions were referred to the Committee on Medical Legislation.

Time Devoted to Sanitary Science in Medical Colleges

Dr. CHARLES A. WHEATON, Section on Hygiene and Sanitary Science, offered the following resolution, which was referred to the Council on Medical Education:

Resolved, That it is the opinion of the Section on Hygiene and Sanitary Science, that in the schedule of hours recommended by the Council on Medical Education of the American Medical Association, far too little time and attention has been given to the subject of sanitary science.

Teaching of Sanitation and Preventive Medicine in Public Schools

Dr. CHARLES A. WHEATON, Section on Hygiene and Sanitary Science, offered the following resolution from the Section on Hygiene and Sanitary Science, which was referred to the Board of Public Instruction on Medical Subjects:

Resolved, That this Section recommends to the Association the full appreciation of the seriousness of infections of all kinds, whether acute or chronic, as a permanent drain on the life capital of the individual which can never be restored;

Resolved, That the supervision of the Health of school children by medical inspection, and the prompt treatment of all children of disease and the correction bodily infirmities and defects be declared by the association as essential to the welfare of the Nation, and

Resolved, That the Association use its effort to have education in sanitation and preventive medicine made a part of the curriculum of all public schools, and that teaching on such subjects be under the recommendation of and subject to the approval of the health authorities of the state or other jurisdiction in which it is given.

The Postoffice and Fraud Orders

Dr. OSCAR DOWLING, Louisiana, offered the following resolutions:

Resolved, That the American Medical Association approves the policy of the United States Postoffice Department in the issuance of fraud orders against disreputable purveyors of nostrum and equally disreputable pretenders in medicine who are robbing while pretending to cure the sick, and

Resolved, That the present declared policy of Hon. F. H. Hitchcock, Postmaster General, to continue this crusade and the firm attitude of Hon. R. P. Goodwin, United States District Judge in enforcing the postal laws against this class of offenders entitles both of them to the grateful appreciation of the American people.

On motion, the resolutions were adopted.

Resolution of Thanks

Dr. ARTHUR MCCORMACK, Kentucky, offered the following resolution of thanks:

Resolved, That the thanks of this Association be and are hereby tendered to the people and profession of Atlantic City and of New Jersey for the hospitality so generously extended to its members, to the Committee of Arrangements for its faithful and successful efforts in our behalf, and to all others who have in any way assisted in making one of the most pleasant and profitable meetings in the history of the Association. Also our thanks to Dr. T. J. Murray, retiring Acting President, and to our President, Dr. W. C. Gorgas, for the able, impartial and courteous manner in which they have discharged their duties.

On motion, seconded by several, the resolution was adopted unanimously by a rising vote.

On motion of Dr. Alexander R. Craig, Pennsylvania, the House of Delegates then adjourned *sine die*.

OPENING GENERAL MEETING

TUESDAY, JUNE 8, 10.30 A. M.

The general opening meeting was held in the Auditorium of Young's New Pier, Tuesday, June 8, at 10.30 a. m.

In the absence of President Herbert L. Buttell, Boston, the meeting was called to order by the First Vice President, Dr. J. J. Murray, Butte, Mont.

Prayer was offered by the Rev. Newton Cadwell, D.D., Atlantic City.

On the platform were ex-presidents, members of the Board of Trustees, the General Secretary, the Treasurer, and distinguished foreigners.

Address of Welcome

The Hon. Franklin P. Stoy, Mayor of Atlantic City, was introduced and delivered the address of welcome.

Mr. President, Ladies and Gentlemen, and Members of the American Medical Association:

I have been apprised of the fact that those who speak this morning must be brief, and I assure you that I will not detain you long.

I am pleased to see before me again this great bunch of intellect. I spoke at your meetings on two or three previous occasions, and you may think it strange that I should do so so many times, but as one of the city officials, I am pleased to be here this morning to welcome you to our city. You come from all parts of this country, and I question whether there is a body assembled in convention to-day anywhere in these United States which represents so many states and territories as you do. Let me say to you, in behalf of the people who live in our blessed city, that we are grateful to you for holding your convention here, and I am delegated to welcome you, not only as a body, but as individuals. I extend to you the freedom of the city. I do not understand all of the paraphernalia that you have brought with you. I see something here that represents perhaps a part of your armamentarium (pointing to a lion's cage belonging to a show). It looks to me as though it is unnecessary to offer or extend to you the courtesies of the Department of Public Safety. In having to take care of so large a delegation and of so many delegations as there are here to-day, it will be necessary for me to divide my honors, and therefore I am going to take pleasure in selecting from among your bunch a doctor who will act as nightmare (night mayor). The word seems very familiar to a great many of you, and perhaps the doctor's name I am about to mention will be just as familiar to you. I want to say that in selecting this gentleman, his name comes very nearly being "Mayor." I refer to Dr. Mayo of Minnesota. I shall leave with the doctor his credentials, and I shall certainly be glad to be relieved at 6 o'clock to-night in order that the doctor may have full sway of all he sees.

I thank you for this opportunity of greeting you, both individually and collectively, and I hope that when you are selecting a place for your next meeting you will not forget the name of Atlantic City.

Address of Welcome on Behalf of the Medical Profession of Atlantic City

Dr. E. H. HARVEY. Gentlemen of the American Medical Association, the local medical profession greets you with best wishes for a most successful meeting. Nine years ago, when you first came here, you saw the sight of mud on our avenues, blocking your progress; but to-day that is all changed. Now there are miles of paved and macadam streets, magnificent hotels, apartment houses, business buildings and cottages and still we are marching on. Our boardwalk has been widened and lengthened, so that now we have five miles of the great boardwalk. Our population here has increased to such an

extent that it has been nearly doubled in ten years. Compare your first visit here with your present one. The day is not far distant when we will have 100,000 resident population here and half a million visitors. Our boardwalk will be lengthened so that it will extend across the length of our island. A mammoth convention hall will greet you some day. Our city fathers have in embryo a "City Beautiful." We have faith in their ideas and feel and know they will mature. Come often and with us watch us grow.

Of water we have three kinds. Purest spring water, pumped into every household on the island, and used by all of us, a more than bountiful supply of salt water, which we use for bathing purposes, an ample supply of fire water, which medical men never use.

Here on our island, on our boardwalk, on the beach, in the surf, on the sea give yourselves, your families, your wives, your sweethearts and your friends a good time. Our town is yours. Our doors are open. The beach, the sea, the surf, are yours. Our homes are yours. Our local medical profession bids you a thousand welcomes.

Address of Welcome on Behalf of the Medical Society of New Jersey

Dr. DAVID ST. JOHN, Hackensack, N. J., President of the Medical Society of New Jersey, delivered the following address.

In coming to our ocean city again, we feel truly honored, for your coming is like that of a valued friend, the welcome of whose visit is intensified with each return.

The Medical Society of New Jersey (the oldest in the United States) bids you a hearty welcome. To the wives, the mothers, the friends of this distinguished body, to the older members of the profession, who have been prominent in advancing and holding high the standard of medical thought and work in this country, we extend a welcome. To the distinguished representatives of other countries, whose names by their works are world wide, we give a cordial greeting. To the younger men of the profession, who have more recently joined your ranks and upon whom the work and promise of the future depends, we bid welcome.

Medicine, as well as surgery, is rapidly becoming an exact science. In recent years great have been the accomplishments in both, and the future is indeed rich in promise.

The advances made by research work in the various fields of medicine, together with the brilliant results in the surgery of the heart, joints, uteruses, veins, etc., made possible by animal experimentation, is hardly less than marvelous, and what forceful answers they offer to the empty arguments of the shouting opponents of vivisection.

The various cults which are assuming a "brief hour on the stage," and which a few may view with apprehension, will only serve to stimulate you to greater and higher achievements. Your profession was never so capable of rendering skilful scientific care to the sick as it is to-day, and should command as its well earned right the respect and confidence of the people, the state and nation, as never before.

You part in the work of advancement in every field of medicine and surgery has been great and notable, and under the leadership of your President, the brilliant Colonel Gorgas, we bespeak for you an epoch making year in your history.

Again, to one and all, we extend a glad welcome.

Introduction of Foreign Guests

At this juncture the First Vice President introduced the foreign guests: Professor Friedrich of Marburg, Germany; Mr. W. Arbuthnot Lane of Guy's Hospital, London, England; Dr. Max Nonne of Hamburg, Germany.

Changes in Meeting Places, Etc.

Dr. Philip Marvel, Atlantic City, presented a report of the Trustees' Committee of Arrangements, as Chairman. He called attention to the changes in places of meetings of Sections on account of a storm, and referred to the arrangements that had been made for the members and their guests.

Dr. J. A. Joy, Chairman of the Local Committee of Arrangements and Entertainments, said that this Committee, in conjunction with the Trustees' Committee of Arrangements, has provided a series of entertainments which would prove enjoyable and attractive, and called attention to the program of entertainments and other matters of interest, as set forth in the official program.

Installation of the President

The President-Elect, Col. William C. Gorgas, Ancon, Panama, was then introduced and delivered his presidential address, his subject being "Sanitary Work at Panama as it Bears on Malaria," which appears in full in THE JOURNAL, p. 1967. Adjourned.

Officers of Sections

The minutes of the various Sections of the American Medical Association will be published in THE JOURNAL later, probably in the first issue of July, since next week's number contains the semi-annual index. The next officers of the Sections are given below. It will be noted that the names of the Sections are given in accordance with the changes authorized by the House of Delegates at Atlantic City.

SECTION ON PRACTICE OF MEDICINE

Chairman—George Blumer, New Haven.
Secretary—Wilder Tileston, Boston.
Delegate—Joseph A. Capps, Chicago.
Alternate Delegate—Alexander Lambert, New York.
Orator—Richard Cabot, Boston.
Executive Committee—Thomas D. Coleman, Augusta, Ga.; C. F. Hoover, Cleveland; Joseph L. Miller, Chicago.

SECTION ON OBSTETRICS AND DISEASES OF WOMEN

Chairman—John G. Clark, Philadelphia.
Vice-Chairman—C. C. Frederick, Buffalo.
Secretary—C. Jeff Miller, New Orleans.
Delegate—Horace G. Wetherill, Denver.
Alternate—L. S. Stone, Washington, D. C.
Executive Committee—J. Wesley Bovee, Washington, D. C.; W. B. Dorsett, St. Louis; Walter P. Manton, Detroit.

SECTION ON SURGERY

Chairman—Charles H. Mayo, Rochester, Minn.
Vice-Chairman—Thomas Huntington, San Francisco.
Secretary—W. D. Haggard, Nashville.
Orator on Surgery—Robert Abbe, New York.
Delegate—Edward H. Ochsner, Chicago.
Alternate—J. W. D. Maury, New York.
Executive Committee—Arthur D. Bevan, Chicago; Rudolph Matas, New Orleans; John C. Munro, Boston.

SECTION ON OPHTHALMOLOGY

Chairman—W. C. Posey, Philadelphia.
Vice-Chairman—Hiram Woods, Baltimore.
Secretary—A. E. Bulson, Jr., Ft. Wayne.
Delegate—T. A. Woodruff, Chicago.
Executive Committee—G. C. Savage, Nashville, Tenn.; William H. Wilder, Chicago; Alvin A. Hubbell, Buffalo.

SECTION ON LARYNGOLOGY AND OTOTOLOGY

Chairman—Chevalier Jackson, Pittsburg.
Vice-Chairman—George F. Cott, Buffalo.
Secretary—George E. Shambaugh, Chicago.
Delegate—D. Braden Kyle, Philadelphia.
Executive Committee—S. MacCuen Smith, Philadelphia; H. W. Loeb, St. Louis; W. Sohler Bryant, New York.

SECTION ON NERVOUS AND MENTAL DISEASES

Chairman—Theodore Diller, Pittsburg.
Secretary—William A. Jones, Minneapolis.
Delegate—M. Allen Starr, New York.
Executive Committee—Morton Prince, Boston; T. H. Weisenburg, Philadelphia; M. Allen Starr, New York.

SECTION ON PREVENTIVE MEDICINE AND PUBLIC HEALTH

Chairman—J. N. Hurty, Indianapolis.
Vice-Chairman—C. F. Williams, Columbia, S. C.
Secretary—M. Langdon Price, Baltimore.
Delegate—J. H. White, New Orleans.

Alternate—C. L. Wheaton, Chicago.

Orator—Seneca Egbert, Philadelphia.

Executive Committee—Prince A. Morrow, New York; W. C. Gorgas, Ancon, Canal Zone; J. H. White, New Orleans.

SECTION ON STOMATOLOGY

Chairman—Thomas L. Gilmer, Chicago.
Vice-Chairman—James Graham Sharp, San Francisco.
Secretary—Eugene S. Talbot, Chicago.
Delegate—G. V. I. Brown, Milwaukee.
Alternate—Stewart L. McCurdy, Pittsburg, Pa.
Executive Committee—M. I. Schamberg, New York; E. A. Bogue, New York; Edward C. Briggs, Boston.

SECTION ON DERMATOLOGY

Chairman—Grover W. Wende, Buffalo.
Vice-Chairman—M. L. Heidingsfeld, Cincinnati.
Secretary—H. R. Varney, Detroit.
Delegate—William Allen Pusey, Chicago.
Alternate Delegate—D. W. Montgomery, San Francisco.
Executive Committee—R. R. Campbell, Chicago; M. B. Hartzell, Philadelphia; William Allen Pusey, Chicago.

SECTION ON PATHOLOGY AND PHYSIOLOGY

President—H. Gideon Wells, Chicago.
Secretary—Yandell Henderson, New Haven.
Member of the Executive Council—M. J. Rosenau, Washington.
Delegate—W. B. Cannon, Boston.
Executive Committee—Walter L. Bierring, Iowa City, Iowa; Walter B. Cannon, Boston; M. J. Rosenau, Washington.

SECTION ON PHARMACOLOGY AND THERAPEUTICS

Chairman—David L. Edsall, Philadelphia.
Secretary—William G. Motter, Washington, D. C.
Delegate—C. S. N. Hallberg, Chicago.
Executive Committee—H. C. Wood, Jr., Philadelphia; M. H. Fussell, Philadelphia; Reid Hunt, Washington, D. C.

SECTION ON DISEASES OF CHILDREN

Chairman—William J. Butler, Chicago.
Secretary—Joseph F. Bicak, New York.
Delegate—Charles Douglas, Detroit.
Executive Committee—J. Ross Snyder, Birmingham, Ala.; E. E. Graham, Philadelphia; Thomas S. Southworth, New York.

The New York Museum of Safety and Sanitation.—In Europe much attention is given to the prevention of industrial accidents. Manufacturers advertise for safety devices to lessen the risks in their shops. There are ten transatlantic museums of safety and sanitation, where employers go to learn how to avoid accidents by seeing what devices will safeguard them against heavy expenditures for damages and secure the protection of the workmen in their employ. The need of prevention of industrial accidents (if for no other motive, to avoid wasting money in litigation or spending it in taxes or charity to support the victims of carelessness) is becoming every year more apparent in the United States. In the whole country from all causes in 1908 there were 500,000 such accidents. The money loss in wage-earning efficiency is at least \$250,000,000, yet 50 per cent. of these casualties are preventable in the opinion of the engineering profession. Then, too, much has been said about the needless loss in war due to preventable disease. In all the wars in which the United States has engaged disease has been responsible for more than 70 per cent. of the mortality, more than one-half of which could have easily been prevented through organization and preparedness. If on the occasion of another war we are not to experience a similar loss from want of preparation, steps must be taken toward diffusion of knowledge of how to prevent these diseases in time of war. A Museum of Safety and Sanitation has been established in New York to show how such losses may be avoided. Models, photographs and diagrams of safety devices that will prevent half of the present loss will be kept on view, so that the American manufacturer can secure the same advantage by preventive measures as his European competitor, and the American people may have the benefit of the most advanced devices of sanitation.

Addresses

EDUCATIONAL IDEALS IN MEDICINE *

W. W. KEEN, M.D., LL.D.

Emeritus Professor of Surgery, Jefferson Medical College
PHILADELPHIA

In the fifty-four years since I entered my own alma mater—Brown University—as a freshman (pray, do not think me an antediluvian; 1855, I assure you, followed the memorable catastrophe of the flood at quite a long interval!) it has been my privilege to know among my fellow alumni a number of its distinguished sons. In public life there were Richard Olney, John Hay, fellow students, though not fellow classmates (how little did I realize what distinguished careers were before them), Charles E. Hughes, already thane of Glamis and of Cawdor, and I hope king hereafter, and Everett Colby, whose fine record is known of all men. In academic life, besides others of lesser note, there were four eminent college presidents, Angell of Michigan, Wheeler of California, Faunce of Brown, and, last but by no means least, my warm friend for nearly two-score years, President Andrews of Brown—Chancellor Andrews of Nebraska.

When, therefore, Dr. Andrews invited me to deliver this address, I was glad to oblige him and glad to make your acquaintance. My only regret is that he, your beloved leader, is absent; and I regret it the more because ill health is the reason. Another beckoning influence was my desire to spy out the land, for, even when I graduated, Nebraska was a wilderness without a railroad and without a city, not to speak of a university. Then Omaha had a population of only about 1,800 and the whole state only 25,000, while the university was not founded till 1869.

I was much impressed lately by an address before the American Association for the Advancement of Science by Professor Royce of Harvard. He said: "The center of gravity of our future American academic life can not always—can not, I think, very long—remain east of the Alleghenies. Through a perfectly natural and inevitable evolution the state universities of the middle west and of the far west, supported as they are, and will be, by the vast resources of their own communities, and guided by constantly improving educational ideals, will, within a generation or two, occupy a very nearly central place in the academic life of our country."

When I look at the splendid appropriations for their state universities by the legislatures of Nebraska, Minnesota, Michigan, Wisconsin, Illinois, and other western states, when I see the superb work done at these great institutions, and when I find that your own state

has the lowest percentage of illiteracy of any of our many states, I am persuaded that the center of gravity is moving westward even more swiftly than Professor Royce intimated.

I am here, therefore, at your call and thank you for the great honor you have done me.

Professor Royce's mention of "Educational Ideals" has suggested my subject—"Educational Ideals in Medicine." By education, however, I do not mean solely that of the school and the college. The home gives us our first and most important and lasting education. If its atmosphere is low and sordid, sordid and low will we surely grow up. The marts of trade, the social life we live, the books we read, the newspapers we scan, the sermons and lectures we hear, the friends we talk with all educate us, no less than the formal training of the school, the university, and the professional school.

The following are some of the educational ideals in medicine:

I. THE IDEAL IN ACQUISITION

This may and ought to consist to a proper extent in the acquisition of money, and if we have the ideals I shall name later the more money we acquire the better for ourselves and for the community. A due reward for our labor and skill is both right and desirable. We must provide for ourselves and our families, and must lay up a store against old age or the "rainy day" of sickness or accident. If opportunity comes, we should strive to acquire still more, but never as the miser who merely adds bond to bond, mine to mine, million to million, and from time to time gloats with glee over his growing hoard, but as the fountain which gathers from every passing cloud the showers that filter through the soil away down below the surface of many broad acres and then distills it in limpid purified streams of water to the gladdening of the parched land and the joy of the thirsty traveler.

But remember the warning of our Lord—recorded, be it observed, by the medical evangelist Luke—"Take heed and beware of covetousness; for a man's life consisteth not in the abundance of the things which he possesseth." A man's *living* may depend on these carnal things, but his *life* depends on far better and more important things.

Besides money, we must acquire knowledge, not only in college and in the medical school, but all through our lives. Here let me urge you earnestly to lay broad and deep the foundations. The superstructure can never be imposing unless the foundations are solid. To a common school and a high school education, add, even if you have to work your finger-nails off, a college training in both the ancient and the modern languages, in mathematics, history, literature, rhetoric, and logic before you tackle the "ologies" in the professional schools.

* The Address at the commencement of the Medical Department, University of Nebraska, Omaha, May 20, 1909.

The other day I read an otherwise excellent medical paper by a promising young man, when suddenly the cold chills ran down my back as I ran across the words "in conjunction with a clinical data." One might as well say "a handsome women." Only by high achievement can he remove the blight cast on him in my mind by that single phrase. It shows that his education has been defective, just as chewing gum or feeding one's self with a knife shows that home training in good manners was lacking. Great geniuses will get to the top of the ladder in spite of such defects, but to the average, or even to the strong man, these fundamental educational defects will always be a handicap.

Moreover, when your time is absorbed in a successful practice it is difficult and sometimes almost impossible to cultivate the humanities and the "literature of power" which add so much grace and charm to the sturdy strength of the "literature of knowledge."

When you have laid a good foundation in a liberal education, then begin your professional studies and work as if your life depended on it. Four years of constant labor are too few to master the great "corpus" of medical knowledge. Your faculty, able as they are, can not give you more than a mere smattering of knowledge, only the A B Cs of what you must later learn for yourselves. But they can do two great things for you. They can teach you the methods by which they have gained, and you can gain, a thorough knowledge of medicine. I would rather teach a man how to study and teach him ten facts than a thousand facts and no method. In the long run the first man will reach the goal, while you won't be able to find the second man with a spy-glass.

Second, they can inoculate you with the virus of enthusiasm, when you will be immune from fatigue, from laziness, from indifference. Like your teachers, you, too, will be idealists, who, all aflame with zeal, will scale the heights of faith and drag the rest of the world up after you.

If you have learned how to study and the bacillus of enthusiasm has developed its intoxication in your system, then, after your graduation, you will begin your long years of real study which will make you an educated physician. Any one of you who fails to study, and study hard, for the next forty years will be left high and dry. To change the metaphor, if you are determined to climb high up on the ladder of knowledge the community will be glad to help you; if you are content to stand at its foot, you are not worth helping!

II. THE IDEAL IN ACHIEVEMENT

This foreshadows the second ideal for which the new century holds its laurel crown—the ideal in achievement.

You must not be content with only acquiring existing knowledge; for what is present knowledge but the accumulated discoveries and inventions of our forbears? If we act only as sluiceways to pass on this fund of knowledge to our successors, we fail of one of our highest duties—to add to existing knowledge by our own researches.

You may not, it is true, be a Jenner, a Pasteur, a Lister, or a Koch, for they are volcanic forces in the world of science that create continents or lift up mountain ranges. Yet, when these very giants sat on the hard benches of the medical school as young fellows, what one of their teachers ever dreamed of the great work they were to do? At sixteen Charles Darwin was

considered "a very ordinary boy, rather below the common standard in intellect," and even at twenty-two he seemed destined to be nothing more than "an idle sporting man."

But you can all add something to the sum of knowledge. The joy of the discovery of a new truth, a new means of diagnosis, a better method of operating, a new serum for treatment which may save hundreds and even thousands of human lives sets the nerves a-tingling with joy and fills the soul with satisfaction as naught else can do. You can have this joy if you will. One of my own Jefferson boys, now Professor Rosenberger, has just accomplished such a feat by discovering a method by which the tubercle bacillus can be discovered in the blood long before it appears in the sputum. By its means he has diagnosed, for instance, a brain tumor, and a tumor in the neck to be tuberculous and not a sarcoma, and made many other similar diagnoses which operation or necropsy has proved correct. I regard it as the most important and most far-reaching discovery as to tuberculosis since Koch's own discovery of the bacillus itself twenty-seven years ago.

Why, then, should not you go and do likewise?

III. THE IDEAL OF SERVICE

The third ideal for you to realize is the ideal of service. Your very bill-heads will remind you constantly of this, for will they not read "Mr. John Smith, to John Jones, M.D., Dr. For Professional Services" so much?

It is a clumsy way of reckoning, however, for who can reckon in coin of the realm the service rendered by the saving of a precious life to kindred and to the community? Who can transmute into paltry dollars the care and skill and learning that shut the door on death? Moreover, to whom shall Flexner and Jobling or Rosenberger render a bill for "professional services to mankind" by the discovery of the antiserum for cerebrospinal meningitis or by the discovery anent the tubercle bacillus? Who will pay it? No one! Remember that "only the lower things of life are sold; the higher things are always given."

The service you will render will always be a personal service, often at the expense of sleep, of comfort, of home joys, of recreation; but, believe me, it pays, as personal service always does. Remember that yours is not a trade, but a profession. "The object of a trade is to make money; the object of a profession is to bless mankind." This ideal of personal service can never be fully realized by others, or, indeed, rendered by others, but only by those of our own guild.

But, ladies and gentlemen of the audience, let me for a moment address you instead of the graduating class. To you of this audience, this city, and this state it is given to assist in this great work, not by your personal labor, but by your appreciation, your encouragement, and your financial aid. Among these young men there are not a few who, like many of my boys at the Jefferson, are longing to devote their lives to research, to discover means by which disease shall be defeated, epidemics lessened or abolished, homes made happy and mankind be blessed. Look at what I have seen accomplished in my own not overlong life; anesthesia, antiseptics and asepsis, the greatest gifts to mankind since the days of Jenner; yellow fever abolished; malaria put in leash; the x-rays discovered; the trichina discovered and its life-history and the easy method of destroying it ascertained—and what that means to Omaha, I need not explain to you; the mortality of cerebrospinal men-

ingitis reduced from 75 per cent. and more to 25 per cent. or less; the tubercle bacillus discovered; and now an early diagnosis in the curable stage made possible; ovariectomy and nearly all other abdominal operations made so safe that the time seems not far off when the well will almost envy the sick the fame acquired by having undergone a big operation! But, seriously, if these and many more similar discoveries have been made in the last sixty years, why may not one—or more—of this very class now graduating thus honor himself and this university and all Nebraska if you give him the opportunity?

The expense of a thorough medical education has grown enormously within the last twenty-five years. Instead of teaching large classes by lectures and a few diagrams we now need large and expensive laboratories, expensive to equip and more expensive to maintain, and the number of teachers must approximate the number of students, for instruction is now largely to individual units rather than *en masse* or even to small classes.

If from among its graduates in medicine the University of Nebraska should send forth one Pasteur, one Lister, one Virchow, or one Koch, or even one lesser light, would not it justify its entire existence and make the whole world its debtor?

I plead with you, therefore, for the erection and endowment of laboratories of research right here in Omaha amid its teeming thousands and its busy industries—one spot where the idea of gain shall be excluded and the idea of service shall be all-absorbing and all-dominating.

You are very practical men, you Nebraskans, and will naturally ask how much it will cost. Not less than a million—one-quarter for buildings and an endowment of three-quarters for salaries and running expenses. A half million will do for a starter, but the other half must be had to make a success. But you may object that "that is an enormous sum for us to give." True, but I have never known the West to refuse a "dare," especially from an Eastern "tenderfoot." Moreover, let me tell you that this sum is small compared with what your research fellows and professors will give in dollars, to say nothing of their enthusiasm, their unselfish lives, and the gifts they will give to mankind. One million dollars, if safely invested, can not bring in an income of more than \$50,000 at the very outside. Yet I know one research worker, a man without substantial means, who, if he entered the arena of surgical practice would easily receive \$50,000 or more a year, but who deliberately rejects this splendid income and is working for the modest salary of \$3,000 a year for the joy and the reward of this work in the discovery of new truths which he has freely given to the whole world. He is giving, mark you, out of his poverty to the community the income of a million of dollars or more. Until you match that by equally liberal gifts you must doff your hats to this devotee of science as more generous than yourselves.

IV. THE IDEAL OF CHARACTER

The fourth ideal which the twentieth century demands of you is the ideal of character. You may win fame, fortune, and power, but, unless you win also a pure and lofty character, the rest will be but apples of Sodom turning to ashes at the slightest touch. "If you want to know what people love most," says the *Outlook*, "do not go into their shops and factories; find out who their heroes are; for the hero always embodies, more or less perfectly, the real aspirations and the fundamental

desires of a people. Who are the heroes loved by Americans? Washington, Jefferson, Franklin, Lincoln, Grant, Lee, Stonewall Jackson, Emerson, Beecher and Brooks. Now it is significant that not one of these men was a great material organizer in the acquisition of wealth. All the American heroes have stood for devotion to principle, for love of liberty, for consecration to the interests of humanity, for apostolic fervor in preaching the religion of Christ, for a noble idealism in interpreting America in terms of spiritual opportunity and achievement."

"To prepare ourselves for sudden deeds by the reiterated choice between good and evil, gradually determines character," says the author of "Romola." Tested by this scale, how high is the honor of your chosen profession! Whenever you close your office door on a woman patient you give your reputation freely into her hands and she her honor into yours! How rarely is this high trust abused by either the one or the other! In my opinion our profession stands preeminently for this ideal of character.

Here, then, my last word to you. Up and be doing, you new graduates of a splendid foster-mother! Take part in the fray! Don't be merely an onlooker, a fossil of 1909, but throw yourselves with all your magnificent western vigor and vitality into the very midst of the fighting. Stand on "the firing-line of scientific advance" and win renown for yourselves and for your university by the greatest possible additions to science and the largest possible service to humanity.

1729 Chestnut Street.

OPHTHALMOLOGIC QUALIFICATIONS WHICH SHOULD BE DEMANDED OF THE GENERAL PRACTITIONER AND OF THE SPECIALIST, RESPECTIVELY

CHAIRMAN'S ADDRESS BEFORE THE SECTION ON OPHTHALMOLOGY AT THE SIXTIETH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, 1909

ALVIN A. HUBBELL, M.D.
BUFFALO, N. Y.

INTRODUCTORY REMARKS

Permit me in opening the Section of Ophthalmology of the Association for 1909, first, to thank you cordially for the great honor which you have bestowed on me and to express to you my appreciation of the confidence which your suffrages have signified.

The example of my predecessors in this office and the scientific expectations of yourselves have demanded of your officers a meritorious program. Our earnest efforts have been made to satisfy you, and we trust that our labors will not have been in vain. For such success as we may have attained, we are indebted to the members of the Section for their cordial assistance and cooperation and for which we are most grateful. As for myself, I am under the deepest obligations to our Secretary for his self-sacrificing, untiring and efficient services.

In submitting to you for your consideration and discussion the preliminary contributions to the program, you will observe that they are made entirely by members of the Association. Professor Fuchs of Vienna was invited to participate in our deliberations and to lend us the prestige of his great name, and through the kind offices of his pupil, Dr. E. V. L. Brown, of Chicago,

who was studying with him during the past year, we had good grounds for hoping that he would accept it, particularly as he had at different times expressed a great desire to visit the United States. But he did not accept, as circumstances were such that he could not leave his university work at this time, to be absent from it so long. No invitation was extended to any other foreign colleague. I trust, however, the character of our program is such that it will not only commend itself to you, but will again indicate the high scientific position which American ophthalmology occupies.

It will be further noticed that the number of papers has been considerably lessened. This has been done in accordance with the judgment of your officers, and also with the approval of the officers of the Association and of many members of the Section. The attempt was made to restrict the number to twenty-five, but this limit has been slightly exceeded. We believe that a program is sufficiently long with twenty-five papers and the discussions; by limiting it to this number the sessions will be shorter, and more time may be given to social intercourse and recreation, which are essential factors in making our meetings attractive.

Another innovation that will be noticed is the adoption of the recommendation of our chairman last year, Dr. W. H. Wilder, who said:

We make a plea for the application of the principles of scientific research to clinical ophthalmology; a plea for organized effort of ophthalmologists in this country to work out certain questions that can be answered only by the accumulated experience of many men.

Many questions and problems in ophthalmology remain unanswered and unsolved. Some of them may not be answerable. Others are of such a character that they can be answered only inductively and after the accumulation of a vast amount of evidence and data. No one man can make observations enough to solve some problems, but a number of men working along previously determined lines may accomplish a great deal.

To this end special committees consisting of a variable number of members, which could be increased as desired should be formed to consider certain subjects.

Such committees should, of course, be selected with care and should be composed of men particularly interested in the subject and peculiarly qualified or fitted to conduct or carry on investigations and direct others in similar work. These committees would carefully outline a plan for the study of certain problems, so that all who were solicited to cooperate or who desired to make observations under the direction of the committee might work along the same line. The committee might increase its number, if desired, so that for some subjects the number of collaborators might be unlimited, but all should work according to a preconcerted plan.

In inaugurating the movement to collectively investigate various problems and questions in ophthalmology as suggested by Dr. Wilder, three committees have been appointed, each in charge of a permanent chairman with power to select his associates and to direct the work, and each to be continued as long as it seems profitable or desirable to do so. Each committee is to report to this Section at its annual meetings. One committee has been appointed on ocular tuberculosis, with Dr. William H. Wilder, of Chicago, chairman; one on questions concerning the ocular muscles, with Dr. Lucien Howe, of Buffalo, chairman, and one on operative treatment of papilledema dependent on increased intracranial tension, with Dr. G. E. de Schweinitz, of Philadelphia, chairman. There is no doubt that the work of these committees will be so productive of good results and will so materially concentrate and advance our

knowledge of the subjects studied that other committees will be organized from time to time in the future.

One other committee has been appointed from this Section with Dr. Casey A. Wood, of Chicago, chairman, which has for its purpose the cooperation with a general committee in the important task of revising the United States Pharmacopeia. The reports of the first three of these committees constitute a part of this meeting's program.

Another feature of the program presented to-day is that it is not only American, but the subjects of the papers, excepting those of the committees, are entirely voluntary, and are chosen by the contributors from among their most special experiences and studies. It is believed that such a program has a variety, freshness and value that will make it as welcome to you, for once at least, as one made up, more or less largely, of papers on assigned subjects. It gives ample proof, also, that this organization possesses resources which, when properly conserved and utilized, add most substantially to the growth and advancement of ophthalmologic knowledge.

In conformity with the rules of this Section, I should, perhaps, recall the essential advances that have been made in ophthalmology during the past year; but this has been so well and fully done by the ophthalmologic year-books of Jackson and of Wood, and by the English and American ophthalmologic periodicals, and especially in the summaries given by Mr. Sidney Stephenson, of London, in the *Ophthalmoscope*, that I regard such an undertaking as superfluous, and shall therefore omit it. There is a subject, however, which it seems to me is of pressing importance, and which I take the liberty of briefly discussing here to-day, viz., the ophthalmologic qualifications which should be demanded of the general practitioner and of the specialist, respectively.

A most humiliating fact in medicine to-day is that ophthalmology, one of its most important branches, is regarded too indifferently by many medical faculties, is a voluntary subject of study by students, and is inefficiently practiced by the physician. Specialism, also, is too often entered on with insufficient preparation.

INSUFFICIENT OPHTHALMOLOGY IN GENERAL PRACTICE

In general practice, how often do we find the physician self-condemned by his own words, "I do not pretend to know much about the eye," and also by his failures even in the ordinary affections of the eye. Ocular diseases are therefore unrelieved, distress and suffering are prolonged, defective vision is acquired, blindness is produced and eyes are lost, all of which might have been largely prevented had even a moderate amount of knowledge of diseases of the eye been applied to diagnosis and treatment, or had the physician obtained competent and seasonable counsel in difficult or obscure cases, or referred them to a specialist for treatment.

In cases of refractive errors and muscular imbalances of the eye with their manifold reflexes, the physician is more at sea than in ocular diseases, and is unable to do anything for them. Such patients voluntarily or by the advice of the physician consult the ophthalmologist, or more frequently the optician, whom he often recommends as competent and trustworthy. The physician's attitude, therefore, is favorable to the optician and leaves almost an open field to this aggressive layman, who appropriates to himself the practice of an important and far-reaching branch of medicine. You know what deception, pretense, charlatanism and harm

attends his practices. You know, too, what success has been attained by the so-called reformers among his kind in hoodwinking numerous legislatures into bringing into legal existence a misnamed "profession" called optometry, and how this, supposed to be safeguarded by a so-called board of examiners, of which physicians and ophthalmologists, I am sorry to say, are sometimes members, has been used to cloak a perilous ignorance of ocular physiology, pathology and optics. In the meantime, no check has been put on the fraudulent work of the various optical colleges, correspondence and other "schools," as exhibited in their courses of instruction, in the graduation of their candidates, and the issuing of their diplomas. The whole business, from beginning to end, is a prostitution of a part of medical science to those low commercial ideals of trade which are made manifest by the character of the advertisements, periodical literature and work of these men.

For this encroachment on legitimate medicine and the unfortunate results to the public which follow, the profession itself is largely responsible through the physician's own lack of knowledge of a subject which he should understand, and through his fostering and propagating the sentiment that the optician can properly and without danger perform this work.

THE UNQUALIFIED OPHTHALMOLOGIST

As to the professed ophthalmologist, there is also reason to complain. He too often enters into specialism with the preparation afforded only by an undergraduate course of study, and a supplemental postgraduate course of a few weeks. He begins his work, therefore, with inadequate knowledge and personal experience, he is often but little more than a refractionist, has only a superficial knowledge, or none at all, of the pathology of the eye, and has no training for operative work on it, and he assumes the same position before the public and the profession and asks for the same recognition as does his neighbor ophthalmologist who is well trained and skilful. That he must often make most glaring and harmful mistakes in diagnosis and treatment with consequent ill results, is inevitable. In a way he thus becomes more or less a menace to public welfare.

Having before us, therefore, the existing conditions of more or less inadequate ophthalmologic knowledge among both general and special practitioners, with all the consequent undesirable and baneful results, is it not apparent to all that there is need of further effort to improve them? Although the American Medical College Association, the American Medical Association through its Council on Medical Education and other channels, and certain high-grade medical schools have done much to elevate medical standards and to advance medical teaching, yet there is still room for much to be done.

There are two dominant factors in the profession today which are largely responsible for the evils of which I am complaining. One is the excessive zeal for specialization, resulting in the effort to sever the relations of certain medical subjects from general medicine and practice, and to set them apart by themselves with an isolation and exclusiveness that is inherently unjustifiable. This is especially observable in ophthalmology, and one of the consequences is that the subject is either neglected entirely or treated indifferently by the student, and is more or less disregarded or ignored by the general practitioner.

The other factor that is responsible for much injustice and inefficiency in ophthalmology as a specialty is

that no standard of legal qualification is required for the practice of it, except that of any legal practitioner. It is to help change each of these conditions that we have a duty to perform.

WHAT MAY BE DONE

First, we can strive to disabuse the public, the profession at large, and medical school authorities of the idea that ophthalmology is so suited to exclusive study and practice, so separate from other departments of medicine, so technical and difficult to understand and apply, as to require special preliminary preparation and a peculiar fitness on the part of the student and physician, that it may, and even should be separated from general medicine, and made only a voluntary subject of study and practice. The fact is, ophthalmology can not in justice to general medicine, as well as to itself, be thus made an exclusive and isolated field because of the manifold relations of the eye to other parts of the body. The subject, instead of being difficult to comprehend and apply, is quite the opposite. The eye is readily accessible to observation; preliminary qualifications different from those which should be required in any other branch of medical study are not needed; its anatomy, functions, pathology and relations are easily understood; the diagnosis and treatment of its diseases and abnormalities need no more skill than those of other organs; when earnestly pursued, no proportionately longer time is required than by any other important subject; the subject may be studied with equal facility; and it offers a field of unusual attractiveness and interest. It should, therefore, continue to be regarded as an essential part of general medicine, and to hold its proper place in study and in general practice. If the physician shall have failed to qualify himself to treat all ordinary diseases of the body, including those of the eye, he renders himself one-sided in his intellectual equipment for practice, his medical judgment is distorted, and his usefulness is abbreviated.

Again, of all diseases and abnormalities, those of the eye are the last to be excluded from the physician's practice, and for several reasons. They are of frequent occurrence, and they are found everywhere. People afflicted with them are entitled to the same attention from the family physician as they receive in other diseases and he should be prepared to give it. Such patients may also be far distant from an ophthalmologist, may not be able to pay either his fees or the expenses of travel, and they should not be put to unnecessary trouble, inconvenience and expense. Again, with ordinary knowledge of ophthalmology the physician will be able to give timely aid in these diseases, to administer preventive, as well as curative treatment, to make diagnoses that will determine benign from severe affections, and to judge properly when his efforts should be reinforced by consultation with a specialist, and when the specialist should have full charge. The physician will also be prepared to detect errors of refraction and to correct, at least, their simpler forms—not so difficult a task as is believed. Such services, moreover, are much more trustworthy than those of the optician or optometrist with his medical ignorance, for many cases of poor vision are not due to errors of refraction, but to ocular disease which the physician would recognize and the optician would not. Finally, in giving his ophthalmologic services to his patients, he may not, and perhaps should not, be remunerated by specialists' fees, but he will reap the same rewards and emoluments that come from other departments of his practice. In the meantime, he will

add to the clientele of the ophthalmologist by the difficult and obscure cases which he refers to him. In this regard, the physician will be a help to the ophthalmologist, whereas the optician (optometrist) is a drawback. Furthermore, the physician will be a powerful factor in stamping out the insidious growth and dangerous charlatanism of the "eyesight specialist" or the optician, and in the end the whole medical profession, including ophthalmologists, will be honored and dignified, and the public will be enlightened and benefited.

Accompanying a change of public and professional sentiment in favor of improving ophthalmology in general practice, there should be a corresponding change in teaching by which the undergraduate medical student is required to acquire an amount of ophthalmologic knowledge sufficient to meet his future needs as a general practitioner.

I assume that the school which he attends has no other function than to teach young men and women to be general practitioners, disregarding all thought of specialism of any kind. In such an institution ophthalmology should occupy a position in its curriculum corresponding to its importance in medical practice, and it should be taught and studied with the same motive and fidelity as other leading branches. This, or any other important subject should never be made voluntary, for such volition, in the majority of cases, leads to indifference or to entire neglect. On the other hand, it should be made obligatory. Having completed the required course, a successful examination in the same should be made one of the essentials to graduation. How much of ophthalmology should be included in an undergraduate course is a debatable question, and should be left to an authorized committee to decide. It should be sufficient, however, to qualify the physician to treat all ordinary and infectious diseases of the eye, to distinguish between mild and severe ones, to treat injuries of the eye which are superficial and uncomplicated, and to examine for refractive errors and correct at least the simpler forms.

While such study may be pursued with sufficient thoroughness to insure the desired qualification, yet I would add a supplementary examination by the several state boards of medical examiners, covering the same ground, the successful passing of which should be one of the conditions for license to practice. This requirement of the state licensing boards is advisable, as it puts a check to any neglect of the subject on the part of medical schools, and its influence over the average student is more potent in maintaining proper standards than almost all others.

While urging that a reasonable amount of ophthalmology should constitute a part of general medicine and practice, I still urge as emphatically that ophthalmology as a specialty is also most commendable and is to be upheld and cultivated.

It is unfortunate, however, that no qualifications for practice have heretofore been required of the ophthalmologist other than those of the general practitioner, but his sense of justice, his pride, and his taste for the subject have stimulated him, in a large proportion of cases, to prepare himself creditably for his work. The absence of these and the presence of a dominant spirit of commercialism have, on the other hand, caused him to make too much haste to begin his practice, limiting his study to an undergraduate course, with perhaps a few weeks in postgraduate work. He neglects taking the necessary time for study, disregards

important subjects, fails to acquire personal clinical experience—in short, he is an unprepared, unqualified specialist—an ophthalmologist only in part. Ophthalmologists are rapidly increasing in number, and the unqualified ones are also becoming correspondingly too numerous. The ophthalmologist, of course, like other specialists, should possess knowledge of his subject much more extended and complete than the general practitioner, and by wider observation and larger experience he should be far more proficient and skillful. Indeed, he should be an expert in this department of medicine. When, therefore, one lacks the necessary qualifications for such a position, he should not be allowed to assume it, both because of the harm he may do to patients and because of the injustice he inflicts on the rights of his neighbor ophthalmologist, who has qualified at much sacrifice of time, energy and money.

In order that protection may be secured against unqualified ophthalmologists, I suggest that the course and subjects of study which the ophthalmologist shall pursue be regulated by law, and that a special board of examiners shall be appointed to act alone, or in association with general boards as now constituted, to determine his fitness, and, if found qualified, to authorize a license to practice to be issued to him.

I will not inflict on you the details of measures which seem to me would secure an adequate amount of ophthalmologic knowledge both in general medicine and in specialism. These can be carefully worked out in the future, if deemed advisable. The one thing, however, more imperative than any other is a proper and trustworthy examination by authorized boards of examiners, the successful passing of which is made the requirement for a license to practice.

In concluding, allow me to recall the question implied in the title of this paper, and to summarize its answer by repeating that the qualifications which should be demanded of the general practitioner are those which would enable him to understand and to treat properly ordinary diseases of the eye, and to examine the eye for refractive errors and to correct its simpler forms. As an assurance of such qualifications, the undergraduate course of study of ophthalmology should be made obligatory, the passing of an examination in it before the medical faculty should be made one of the conditions of graduation, and a subsequent examination in it before the state licensing board, one of the conditions of license to practice.

The qualifications which should be demanded of the specialist are an extended and thorough postgraduate study of every subject essentially bearing on ophthalmology, personal experimental study in the laboratory and personal clinical work in the hospital or in a preceptor's private office. To insure the proper qualifications, legally appointed boards of expert ophthalmologists should examine applicants in such subjects as should be required by law, the result of which should determine whether or not a license should be granted.

I offer these imperfectly expressed suggestions for the consideration of this Section with the hope that they may be accepted. If so, two committees should be appointed to study the subject and to report the details of measures that might be adopted to bring about the results desired; one to make reasonably certain the acquirement of a proper amount of ophthalmologic knowledge by the general practitioner; and another to secure the necessary training and qualifications of the ophthalmologist.

A PRAGMATIC VIEW OF CHRISTIAN SCIENCE *

EMIL C. WILM, PH.D.

Professor of Philosophy in Washburn College
TOPEKA, KANS.

It has been more than once asserted in recent discussions of Christian Science and kindred forms of occult therapy that their therapeutic success is in no way dependent on the theological or metaphysical doctrines on which these systems purport to be based; that these theoretical elements are, in fact, from the point of view of success in healing, irrelevant and unessential. Drugless healing, for example, it is said, is successfully practiced by persons and sects whose religious and metaphysical dogmas have little or nothing in common with those of Christian Science, and, what is still more significant, by scientists who, many of them, do not espouse any religious system whatever, or, if they do, do not connect in any way their therapeutic practice with their religious beliefs.

The facts referred to are, as facts, sufficiently authentic, and I have no intention to controvert them; but the conclusion drawn from them is, it seems to me, too sweeping and even misleading on a fundamental point in our understanding of the very striking phenomenon of mental healing. To make my objection clear, however, will necessitate some preliminary exposition of a theory of drugless healing of critical importance, the theory of mental suggestion; a theory which is not in any sense a special theory, but which may, in its broad features, at least, be assumed to be the common possession of all technical students of applied psychology.

The salient features of this view are not difficult to outline. It is a mere commonplace to-day, and perhaps always has been, that one's mental state, especially on its emotional side, has much to do with one's physical condition; that, in particular, emotional states, such as anxiety, grief and fear, depress and interfere with certain bodily functions, like heart action, respiration and digestion, on which bodily well-being is so intimately dependent, while opposite states, like cheer and mental tranquillity, have a tonic effect on these important functions. The production, therefore, in the patient, of an attitude of hopefulness and confidence may, especially in the lighter forms of neurosis, brought on, perhaps, by worry or mental depression, be an important factor in restoring the patient to a more normal condition, and may, in crucial cases, in which life is hanging in the balance and every condition becomes important, be decisive in causing the patient to rally and survive. These truths have in their essential phases become a part of the proverbial wisdom of the race, and they doubtless need, on account of their great practical importance, to be systematically re-emphasized. They have latterly, indeed, been exploited *ad nauseam*, and their importance has, by a sort of mental epidemic, been exaggerated to a point of caricature. But they have been practiced by every competent physician in every community since the beginning of time, and have been claimed as the precocious discoveries and the exclusive possession of certain propagandists simply because they

have proclaimed these commonplaces from the housetop, and, as is usual with such performances, to a large hearing and devoted following. The results of these important "discoveries" are forthwith carefully conserved and industrially propagated by Christian healing circles, classes in psychotherapy, temples of health and other unprofitable aberrations.

The condition of hopefulness may operate in two ways in restoring the patient to health: first, directly, by the tranquilizing effect on the nervous system, and, second, by causing him to resort to the usual means of restoring health, such as exercise, change of scene, dieting, the use of medicine, etc. On this point it is, however, important to observe that the effect of overconfidence may be the precise opposite to that suggested, and may, especially where intellectual bias against the use of physical means is operative, cause the patient to neglect these means, and thus, in spite of some gain from a hopeful state of mind, deteriorate from what should be plainly diagnosed as wilful and criminal neglect. The fact that individuals responsible for such cases can, by hiding behind the ramparts of religious tolerance, escape social censure and legal prosecution furnishes a striking comment on a brand of idealism which America can surely spare without substantial loss to an otherwise sane and hardy civilization.

Disregarding, however, the occasional danger from overconfidence, let us say that the cases of healing by Christian Science, when they are genuine, are directly due to a hopeful mental condition induced by mental suggestion to the effect that the patient's disease is non-existent, or that its effects will, in any case, be rendered nugatory. Now what I wish to urge in this pragmatic brief for Christian Science is that the manner of inducing this hopeful mental condition can be considered optional only when the question is considered in the abstract, but will, in the concrete case of a given patient, be pretty definitely determined by the character and previous education of the person in whom the expectant belief in health is to be induced. The belief in the result must be made plausible in a way best adapted to the patient. In the hypnotic condition this is not necessary. The hypnotic trance is a favorable condition for implanting suggestion, for the reason that the suggestion is in little danger of being rendered ineffective by spontaneous reflection, the associative mechanism being temporarily inoperative, and reflection being, therefore, in abeyance. But if the belief is to be induced in the waking state it can be done only by making the object of the belief appear possible or probable. How this is to be done must be decided separately in each special case, and the appropriate manner will accordingly be as various and versatile as human nature. One will believe on the mere assertion of another person who is supposed to possess special knowledge or power; another will base his faith on a theory of magnetic fluid or the efficacy of sacred relics or shrines; another will rely on the merit of saints or the special intervention of a prayer-answering divinity; another on a physiologic theory of the effects of exercise or the action of drugs; while still another will base his belief on a high-sounding and mystical system of metaphysics according to which there is "no pain in Truth and no truth in pain; no nerve in Mind and no mind in nerve," and according to which "Life, God, Omnipotent Good, deny death, evil, sin, disease." Now when you combine, as in the last instance, a pretentious and mystical system of metaphysics with theological conceptions which a long and cumula-

* The term Christian Science is here used as a merely conventional designation, and the use of it does not of course in any way commit one to the highly fantastic dogmas for which the cult stands. The term Eddyism, were it domesticated, would be much preferable to the egregious misnomer in current use.

tive social tradition has invested with peculiar sanctity and force, you have an instrument the suggestive value of which for a certain type of minds (their name is legion), whose native mystical bent has not been corrected by systematic education in the methods and results of modern science, is well-nigh incalculable. Of course, what is one man's meat is another's poison, and whether meat or poison will depend entirely on the particular individual's character and intellectual bias gained through circumstance, deliberate self-discipline and the educational activities of the group of which he has been a member. But if a given individual is so constituted that no violence is done to his total experience by the metaphysics of Christian Science, then this system is perhaps the most effective and conceivably the only means to secure, in this individual, the state of mind requisite for health and happiness. And that Christian Science offers, in a large number of cases, just the aid which the imagination requires, the present great popularity of Christian Science and kindred phenomena abundantly attests.

Considered from the point of view of orthodox science or of consistent thought the value of Christian Science is *nil*; this much, at least, must be as plain as paint. But if it makes as little sense to ask whether a theory is true as to ask whether it is blue (a piece of pragmatic facetiousness) and if the truth of a view is measured by the measure of its success in life and practice, then Christian Science is, on its metaphysical side, a highly respectable candidate for philosophic honors. It is one of those views, many more of which could be named, whose logical value is either negligible or non-existent, but which, nevertheless, seem to serve an important practical purpose, and which, therefore, appear to be justified in cases where the practical demand is more urgent than the theoretical one of making life a rational and orderly whole. Pragmatically considered, Christian Science frequently appears to be right; scientifically it is wrong from beginning to end. And this may be used as an argument for Christian Science or against pragmatism as suits the taste.

My own view (if the reader should care for it) is, to use the striking words of Bradley, that no man ever went about to break logic but in the end logic broke him; and how the inevitable logic of Nature which we call natural law, and which we sometimes affect to despise, sometimes revenges itself on us and breaks us has been already suggested in a painful reference from the further elaboration of which I must be excused. The reader will doubtless be able to supply concrete illustrations from his own experience if he wishes to do so. It is powerfully illustrated by that mute but mighty army of men and women who, though not believing in death and disease, have not been able to resist the universal conquerer, and who have often fallen a ready prey to his power because heedless of the manner of his operations, and failing to fight him with his own weapons: those laws of Nature, namely, whose universal and consistent sway proclaims them divine.

Gonorrheal Nephritis.—Stoyantchhoff, in the *American Journal of Urology*, May, states that the treatment of gonorrheal nephritis differs little from that of any case of acute nephritis. The diet should consist exclusively of milk; diuretic and alkaline drinks may be added. As a urinary antiseptic he advises salol—2 grams daily. If the pain is great and the albuminuria is moderate, opiate may be given without fear of aggravating the renal lesion.

WHOOPIING COUGH FROM THE POINT OF VIEW OF PUBLIC HEALTH *

CHARLES R. GRANDY, M.D.
NORFOLK, VA.

Whooping cough has so long been treated by the laity and also by some physicians as a joke that I would hesitate to bring the subject to your attention, if I did not feel that it is high time for the medical profession to put aside this erroneous idea and give serious thought to checking this large source of infant mortality. That there is some excuse for the popular impression that whooping cough is not a serious disease is shown by the following quotation from one of the older editions of Strumpell's "Text-Book of Medicine":

The prognosis is favorable with the majority of children, if they are previously strong and healthy. Very young children are in more danger than older ones. There is danger if secondary pneumonia develops and if the general nutrition and strength of the child suffer.

This is the teaching I received in college, and it is certainly enough to give the student the impression that whooping cough is a disease not to be greatly feared. The feeling that whooping cough is a trifling affair seems to be due in the main to two reasons. The first is that in children over five it is seldom fatal, 96 per cent. of those who died from this disease in 1906 having been under that age. The second is that the patients usually die from some terminal complication, most often from bronchopneumonia, which, according to Holt, is responsible for two-thirds of the deaths from whooping cough and is often put down as the cause of the death without reference to the previous disease. But this, of course, is not the proper classification of the death, for the bronchopneumonia would not have occurred without the whooping cough and is entirely secondary to it. This is likewise true of the diarrheal diseases, the convulsions, and the marasmus which frequently come at the end to carry off the whooping-cough patients. On account of this erroneous classification, our mortality from whooping cough, which, as I shall show, is now far too large, seems smaller than it is, though how much smaller it is, of course, impossible to say.

To prove to you that whooping cough is really a very serious matter, I think it will be advisable, before going farther, to give a few statistics in regard to the mortality from this disease, though this varies greatly in different cities and in different years, for, to quote the census reports for 1907, "whooping cough, like scarlet fever and measles, seldom shows an unbroken high prevalence from year to year in a given city, but fluctuates with high rates for a year or two and then abruptly declines." It nevertheless nearly always causes more deaths in the registration area than measles or scarlet fever, and in 1907 caused sixty-five times as many deaths as smallpox. In 1906 there were 6,324 deaths attributed to whooping cough as against 4,856 deaths in 1907, and in both years typhoid and diphtheria, alone of the epidemic diseases, gave a greater mortality. "Yet the United States occupies a somewhat favorable position among the nations with respect to its death rate from this disease," the rate in some of the European countries being many times that in this country. It is interesting to note that in ten years in New York City whooping cough killed 3,200, while in the same period only 3,430 deaths were attributed to typhoid. To come

* Read before the Richmond (Va.) Academy of Medicine and Surgery, May 25, 1909.

nearer home, we find that the highest death rate in 1907 was in Lynchburg, while Dr. E. C. Levy, in his "Annual Report of the Health Department of Richmond," says:

It is not generally recognized, either by the people or by the medical profession, that measles and whooping-cough are the two children's diseases that are especially fatal in this part of the country, far exceeding, as shown by our own statistics, scarlet fever, which is ordinarily regarded as much more to be dreaded, and also exceeding diphtheria since the general use of antitoxin and proper quarantine regulations, based on bacteriologic methods.

Let us now take a general view of the situation and see what seems to be the cause of this large death rate and what is being done to reduce it. I think the first reason is the general impression that whooping cough is a comparatively mild disease which all children must have, and that the sooner it is over with the better it is for all concerned. On account of this belief, there is often no attempt made to protect children from infection, and people whose children have whooping cough see no reason why they should be inconvenienced in order to save the children of their neighbors. For this state of affairs I believe the medical profession is primarily to blame, for we have not warned the public sufficiently of the danger to young children and very often have told the parents to keep children with whooping cough out of doors or to send them to the park; while we have failed to warn them not to let these patients come in contact with other children. As a result we not only find children with whooping cough in the streets and parks, but they are taken without compunction on the street cars, trains and steamboats, and are even sent to visit other children in their homes. When we consider that over 95 per cent. of the deaths from whooping cough occur before the fifth year, and that consequently we could save almost all the children who die of it, if we could merely keep them away from direct infection till they were beyond that age, we can appreciate how criminal our present carelessness is. There are, however, various things that make the segregation of whooping-cough cases very difficult. The older children do not feel very sick and want to run and play as usual, though they can spread the infection at any time during the six or twelve weeks that the disease lasts. Besides it is very necessary for these patients to get outdoor air, and in getting this great care must be exercised to keep them away from other children. Furthermore, the infectiousness begins with the very onset of the disease, so that other children are frequently infected long before the diagnosis of whooping cough is made in the first patient. Consequently the problem of lessening whooping-cough mortality presents many difficulties which so far have not, to my knowledge, been aggressively attacked by any health department, for, as Dr. Chapin, of Providence, says, "no one has suggested any efficient method of combating whooping cough." The patients themselves are excluded from the schools when the disease is fully developed, but their brothers and sisters are allowed to continue their studies through the possibly most infectious catarrhal stage, during which period they are almost sure to infect schoolmates with infant brothers and sisters at home. Further than this exclusion from the schools I know of no public measures for hindering the spread of whooping cough.

In regard to prevention. Forchheimer very pointedly remarks: "In few diseases can so much be done by prophylaxis; in few is so little done"; for from a practical standpoint whooping cough seems to be only directly infectious, though a few cases are on record

which seem to have been carried by a third person. Therefore, though it may sound presumptuous for me to make suggestions in regard to controlling a disease, for which "no one has yet suggested an efficient method of combating," I nevertheless think it is time for some one to present plans which can at least call forth criticism, if they are not capable of standing the rigid test of actual use. I would base my plan of attack on the propositions that over 95 per cent. of the deaths from whooping cough occur before the fifth year, that after this age the disease is comparatively mild, and that in consequence we can reduce the mortality to a relatively unimportant figure by merely protecting the children under five years from direct exposure. The first step in this direction is to teach the people that for young children, and more especially for infants, whooping cough is one of the most fatal diseases, but that their children will be comparatively safe if they can only ward it off for a few years by keeping them away from children with the disease. It is, therefore, a campaign of education that we must carry on, though not nearly so difficult a one as that which is now being waged against consumption. And, by the way, we should be able to use some of the well-organized forces engaged against tuberculosis, for whooping cough is an undoubted predisposing cause of tuberculosis in children. The health departments should then begin this work of education, and they should begin by seeking the advice and hearty cooperation of the physicians of their respective communities, for without this the work will be vastly more difficult. Having done this through the medical societies or by letter, let the people be warned of the danger to young children from whooping cough, not only at the beginning of the campaign, but every time the disease starts up in a city or in any fresh section of it. Having told the people that whooping cough is more fatal than scarlet fever and smallpox, let the health departments prove that they believe it themselves by treating whooping cough in much the same way that we treat other contagious diseases. Of course, it will be impracticable as well as unnecessary to quarantine a whooping-cough patient in one room, as we do scarlet fever, diphtheria and smallpox, but a modified quarantine should be instituted in all cases.

The first actual step to be taken with the individual cases is to see that they are reported as promptly as possible to the health department. The house should be placarded, as much to make the parents feel that the case is serious as to warn friends and neighbors of the presence of the disease. A medical inspector should then go to the house, give the people instructions as to the seriousness of the disease with young children, as to how to prevent its spread, the probable time the contagion will last. He should also have printed instructions to supplement what he has said. The instructions as to quarantine will, however, have to be modified to suit the cases and the circumstances of the family. Thus children that live in houses with yards and porches, ample enough to provide the very necessary fresh air, should not be allowed to leave the premises. Less fortunate children might be allowed in the streets and parks, if they wore conspicuous ribbons bearing the word "whooping cough," but this privilege should be withdrawn if they were found to be purposely mixing with other children. A still better place for these children is a special hospital outside of town, where they could get plenty of fresh air and good food. For this is the only sure way of saving the babies of the tenements from infection. All large cities should have these whooping-cough hospitals,

and it speaks very badly for America that we have no place to put these children, who frequently must be kept at home to infect the others in the family. Not only should a medical inspector have the right to send to this hospital all patients that he does not think can be cared for at home, but also any patient who breaks the quarantine rules established by him should be sent to the hospital, no matter what the financial circumstances of the family. Not only should the whooping-cough patient be withdrawn from school, as seems to be the universal custom, but the other children in the family should be excluded for two weeks after being separated from the patient, and this exclusion should be continued, if they have even the slightest coughs. Any pupil who has been exposed to contagion and who has a cough should be immediately sent home by the teacher, who should also notify the health department. In this way one of the greatest sources of infection, the patients who have not yet "whooped," will be nearly eliminated from the schools.¹

It is frequently easier and better for people with the necessary means to send their young children away from the house; which contains a case of whooping cough, but these children must be watched and kept away from other children as soon as any suspicious cough appears.

The placard and the quarantine should not be removed from the house, if we follow the rule laid down by Forchheimer, "unless six weeks from the onset have elapsed, until the true whoop shall have disappeared entirely and until expectoration shall have practically ceased." The room occupied by the patient should then be disinfected as much for educational purposes and for justifying the placarding and quarantine as for the removal of contagion left in the room.

Another most important prophylactic measure lies, I am afraid, in the main, beyond the reach of the health departments; I mean the early diagnosis and the consequent prevention of infection from cases in the catarrhal stage, for until we are certain of the bacterial cause of the disease and can diagnose it as we do diphtheria, we shall have to depend on the individual observations of the family physicians, but the health authorities can help them by warning them of the presence of whooping cough in the city as soon as the disease is reported. Thus warned we should not wait for the "whoop" before telling the parents that the disease may be whooping cough and that they consequently must be careful not to spread it. In such cases a dry cough with practically no chest signs, little or no rise of temperature and a lymphocytosis is enough to make a diagnosis; and this early diagnosis may be enough to stop a considerable epidemic. Nothing is more important than this early diagnosis and early warning from the doctor who is called in to look at the child; and the health authorities, I am sure, can count on this cooperation on the part of the physicians, for without this early diagnosis the disease can spread to a considerable number of children before actual public health precautions can be taken.

Of course, I do not claim any originality in the methods I am suggesting, for they are being used in various other diseases. What I do maintain is that they should even now be applied in a rational way to a disease, which is one of the largest sources of infant mortality and which at present we are absolutely neglecting. The

public is educated to demand protection from smallpox, but absolutely uneducated as to the possibility of preventing almost all the deaths from a disease which is now killing sixty-five times as many people as smallpox. It is up to us physicians, but more especially up to the health departments, to open the eyes of the people in regard to whooping cough and teach them to prevent what under the circumstances seems a very shocking mortality.

101 Freemason Street.

SOME THOUGHTS CONCERNING SLEEP AND DIGESTION

GEORGE M. NILES, M.D.

ATLANTA, GA.

Let me have men about me that are fat,
Sleek-headed men, and such as sleep o' nights.—*Shakespeare.*

The devout psalmist sang, "He giveth His beloved sleep"; old Homer exclaimed, "Sleep is the gift of God"; the poet Young wrote of it in his "Night Thoughts" as "Tired Nature's sweet restorer," and also:

Man's rich restorative, his balmy bath
That supplies, lubricates and keeps in play
The various movements of this nice machine.

Depew calls it "the solvent of longevity, health and work"; while Henry Claws, the financier, said recently, "Sleep means everything to a man—good health, good looks, will-power, and self-confidence." Wise men from Socrates to Russell Sage have advocated spending one-third of the twenty-four hours in bed. All this shows a deep appreciation of this restful attribute among all ages and conditions of human thought.

Sleep, as a "balm to hurt minds," has been thoroughly considered by the neurologists, and, as a desideratum in all acute and continued diseases, will be found mentioned frequently in the various works devoted to therapeutics.

As to the actual influence of sleep on digestion, however, there is some conflict of opinion, and I shall endeavor briefly to cover the subject in a manner helpful to those interested in practical dietetics.

It is a well-known physiologic fact that the elimination of carbon dioxide and absorption of oxygen are diminished during sleep, mainly because the muscles are less active.

Tigerstedt places the ratio of metabolism between the sleeping and waking state as 100 to 145, but asserts it to be dependent on cessation of voluntary movements: "for it may reach just as low a level in the waking condition, if the muscles be completely relaxed and every voluntary motion suppressed."

While other secretions are diminished during sleep, this does not apply to those of the digestive apparatus. "It is sometimes stated that the digestive secretions are diminished during sleep, but the statement does not rest on satisfactory observations, and may be doubted" (Howell). "Sleep does not exercise the least influence on the secretory work of the gastric glands" (Winfield Hall).

No one would deny that a baby thrives best, and puts on weight most rapidly, when he can sleep soundly after each full meal from the maternal fount. It is a frequent custom among those who perform arduous physical labor to take a sound nap during the noon hour immediately after eating; and some of the finest specimens of muscular development that I have observed have been those who went to bed promptly after eating a hearty supper, and just as promptly went to sleep.

1. Attention has recently been called to the number of cases of measles and whooping cough contracted in the kindergartens. So it is questionable from a public health standpoint whether these schools should be allowed to take pupils under five years of age.

As to the movements of the stomach and intestines during sleep, those movements are to all intents and purposes as active as during the waking hours, less the stimulation of extraneous impressions produced by muscular exercise or the play of emotions. Some physiologists claim that gastric and intestinal mechanisms are abrogated during sleep, but Dr. W. B. Cannon, in reporting some of his investigations on animals, writes: "It is worthy of note that nearly all the animals curled up and slept during the time between observations; nevertheless, the progress of food through the intestines continued. The statement is also made that at night, even without sleep, the intestines are almost entirely at rest; that this is their normal time for repose. I have seen both large and small intestines actively at work, however, from half past nine until half past ten at night." These statements I have several times personally verified.

One qualification should in fairness be allowed, and that is the lessened influence of the reflexes during sleep, especially deep sleep. The following from Landois, while not entirely in accord with some of the conclusions drawn, calls attention to the diminution of reflex action, affording a basis for a practical deduction later on: "During sleep there is a reduction in the activity of gastric and intestinal movements and in the secretions which indicates a lessening in the activities of the respective nerve centers; and the diminished reflexes indicate a lessening in the activity of the spinal cord." With the last statement I am in accord, but the preponderance of proof would permit us to assume that during sleep the gastric and intestinal secretions are poured out with unabated freedom, and that the mechanics of digestion progress in an orderly manner. We must not, however, lose sight of the decided psychic influence for good or ill exercised during the waking hours. That pleasurable sensations may augment the flow of gastric juice, even when no food reaches the stomach; or that disgust may check its secretion has been amply proved by Pawlow and others. The fragrant cigar after a savory meal, coupled with peace of mind and pleasant society, lends a psychic aid to digestion which is entirely absent when the reflexes are dulled by sleep. Again, that fear may cause peristalsis is only too well attested by many soldiers who feelingly remember their "hurry calls" on the eve of their first battle.

Another point to consider is the motor power of the stomach. I have found that in four out of seven duration tests, whereas the stomach would barely empty itself in three and a half waking hours, it was not quite empty if the subject observed had been asleep part of the time. This number is too small to be conclusive, but it is strongly suggestive of the rôle the waking senses may unconsciously play in assisting this viscus to perform the mechanical part of its task.

When the brain is alert, the reflexes on guard, and the voluntary muscles at work, each department of the human economy is calling for its quota of innervation and blood; these different departments are exacting their tribute from the constructive forces, and turning over to the excretory organs the products of combustion and waste. During this period the digestive department can draw only a "working interest," not being permitted to put away any appreciable surplus, until the day's activities are ended, sleep stills the voluntary movements, decreases the carbon dioxide output, and makes the least demand on the involuntary vital mechanism. It is then that Nature, our industrious handmaiden, begins her constructive housekeeping. "She

does it in an orderly cooperative way, following a regular method of work in repairing waste, actively forming new tissue, and giving just the proper amount of care and nourishment required of all parts, both mental and physical, in regular sequence.

When Shakespeare wrote of "fat men who sleep o' nights," he recognized a principle patent to every one; for those who sleep much, thereby allowing the plentiful recuperation of both body and nerves, are generally rotund and cheerful. Dickens' fat boy, so characteristically portrayed in *Pickwick papers*, might be cited as a "near-classic" illustration that there may be as much truth in the injunction, "Sleep and grow fat," as the old saw, "Laugh and grow fat."

It must not be understood that I advocate heavy meals at night, or articles of food calculated to tax the propulsive power of the digestive canal. In the young and vigorous, in whom the muscle fibers are elastic, and the nervous system unimpaired, little fear need be entertained but that a meal will be cared for at any hour, though habitual overindulgence in eating at unseasonable times, like any other abuse of the bodily functions, will exact its toll of punishment sooner or later. In the aged, however, or those with sluggish motor force, or hyperesthetic nerves, it is best not to place too much work on the stomach and intestines during the hours allotted to sleep.

A certain amount of food in the stomach, the digestion of which, in drawing from the brain a portion of its blood, keeps busy the nerve centers concerned, indirectly quiets other nerve centers which otherwise might exert a wakeful influence. Many sufferers from insomnia well know the happy effect produced by taking hot milk or cocoa, or a light repast just before retiring.

The following are some general suggestions as to dietetic recommendations in relation to sleep:

The young infant can not get too much sleep, and this is best attained by filling his stomach at stated intervals. Vigorous, growing children and those engaged in manual labor thrive on a full breakfast and dinner, these two meals containing most of the daily quota of proteids. The supper may be plentiful in quantity, but should consist of such articles as bread, milk, cereals, eggs, fruits, etc., which do not unduly stimulate the nerve centers by their metabolic products. Soups, rich extractives and solid proteids also cause the bladder to be filled with urine rich in waste products and very acid, this being a factor worth considering.

Those who labor with their brains, or skilled artisans whose crafts demand mental tension and but little muscular effort, will find their efficiency best subserved by a light breakfast, a slightly more plentiful lunch, and at the close of the day's work a generous meal, provided that after it three to five waking hours are allowed, so that the psychic reflexes may have an opportunity to contribute their share to the processes of digestion.

For the leisure class or those who keep late hours and often burn the candle at both ends, it is advisable to take a light repast in bed at 10 a. m. to 12 noon, a hearty dinner at 5 to 8 p. m., and a moderate supper, with not too stimulating or alcohol-containing beverages at 11 or 12 p. m.

The foregoing suggestions are intended to be elastic, requiring such changes as may suit individual habits or environment, and the thoughts herein are offered as a small contribution to an interesting subject and one not too well understood.

409 Candler Building.

THE RESPONSIBILITY OF THE PHYSICIAN IN CASES WHICH ARE A MENACE TO PUBLIC SAFETY *

WILLIAM RUSH DUNTON, JR.

Assistant Physician, Sheppard and Enoch Pratt Hospital
TOWSON, MD.

In a paper by Dr. Philip Coombs Knapp entitled "General Paralysis as a Menace to Public Safety in Transportation," which appeared over a year ago,¹ it was stated:

There can be little doubt that if men in responsible positions on our railroads were subjected to thorough examination by competent neurologists at regular intervals many of these cases of general paralysis and other brain diseases would be detected and the dangers attendant upon them be averted. Many railroads demand a careful examination of all applicants for employment; but when this examination is once passed, the man is not examined again unless some striking disturbance is noted. The average railway surgeon, however, will inevitably overlook the slight but significant symptoms that reveal grave brain disease to the neurologist, and, even if he were capable of detecting them, it is only by examinations repeated at regular and rather frequent intervals that the onset of these diseases can be detected and the danger averted. These affections are not responsible for all the cases of negligence that cause railway accidents, but they form one factor which can be eliminated. The state requires that certain railway employes shall pass examinations to prove that they can tell red from green. Is it too much to require them to pass periodical examinations to prove that they can instantly understand the different meanings of red and green and act promptly on that knowledge?

In the same journal there also appeared an editorial on the same subject, in which it was stated that a committee composed of Drs. Knapp, C. G. Dewey and G. A. Waterman had been appointed by the Boston Society of Psychiatry and Neurology to confer with the Railroad Commissioners of Massachusetts and to take such action as they might consider necessary to guard against this danger.²

After reading the above I felt that as a civic duty I ought to do what I could to extend the influence of the above movement and as a first step I contributed a note which appeared with additions by the editor, Dr. Edward N. Brush, in the January number of the *American Journal of Insanity*.³

I then called on a friend who occupied an important position in one of the railroads of Maryland to urge on him the importance of instituting such neurologic examination of engineers, and others directly responsible for the lives of passengers, as would indicate the early symptoms of organic nervous diseases, such as paresis, that would in their development impair the judgment of the subject and so render him an uncertain quantity so far as safety is concerned. The matter had never been brought to my friend's attention before and it aroused his interest; but I was necessarily passed on to the official whose duty it is to supervise such matters, namely, the chief physician of the road. In the latter's opinion such a procedure is unnecessary for several reasons. The chief of these are:

1. The men would not submit to such an examination.

2. A candidate's rejection for some neurologic symptom not plainly apparent to the subject would bring a

strong protest from him which it would be difficult to answer to his satisfaction.

3. Following the candidate's objection there would immediately follow a much stronger one from the labor organization to which he belonged.

The last appeared to be the most important reason to the physician. Probably most of us who are rather unfamiliar with the methods of some labor organizations will fail to appreciate why this last reason should appeal to him so strongly. The same objection appeared to be the chief one to the surgeons of two roads. I feel that perhaps the most important duty we have in connection with this question is the moral education of the men themselves so that they will put aside any selfish considerations and consider the greatest good of the greatest number.

I felt that part of my civic duty was the investigation of the methods of examination used by the various railroad surgeons in order to satisfy myself that such an examination would detect any fairly marked neurologic symptoms, though I could easily understand that the ordinary medical examination could not include a thorough neurologic one.

I regret to say that in none of the three forms of the examination blank submitted to me was there any question concerning the conditions of the pupils, tendon reflexes, station or coordination, all of which seem to me to be important and taken together to give a maximum of information for a minimum of effort.

One blank asked if there was facial paralysis, and if there was serious defect in speech. The surgeon of one of the railroads also assured me that their usual examination included more than was set down, but there was certainly no space on the blank for recording any additional points brought out by the examination, and my experience with men who habitually follow a printed examination blank is that they are not apt to go beyond it.

I suggested to each of the surgeons interviewed that they add to their examination blank some question regarding the pupils, the knee-jerks, station and coordination, but was met with objections similar to those noted above.

None of the surgeons was indifferent to the importance of the recognition of organic nervous disease, but all seemed to think that its recognition would be easy in any dangerous case and that routine examination was, therefore, unnecessary, but the labor organization seemed to be the chief objection.

The results of my investigation of the methods of examination in use by the three railroads may be very briefly summed up as follows:

1. The medical examination is inadequate for the detection of any organic nervous disease.

2. Those in charge of such work are handicapped by the attitude of labor organizations and by the attitude of the ordinary working man.

It may be interesting to describe two cases recently seen, which will serve as illustrations for a number of points which have already been mentioned and for others which are to follow.

CASE 1.—*Patient*.—John T. A. S., a white man, aged 43, married, was admitted to the Johns Hopkins Hospital Dispensary Aug. 22, 1908, complaining of his mind being affected. His father died at 64 from the "third stroke," having had the first eight years before. His mother was living and well, aged 76.

History.—The patient is the third of six children. Consanguinity between his parents, or any case of mental or nervous disease in the family was denied. According to the

* Read in the Section on Nervous and Mental Diseases of the American Medical Association, at the Sixtieth Annual Session, held at Atlantic City, June, 1909.

1. Boston Med. and Surg. Jour., Feb. 6, 1908, clviii, 187.

2. As additional testimony to this danger I would refer to the London letter of THE JOURNAL A. M. A., Sept. 12, 1908, II, 928.

3. 1909, lxx, 545.

patient, he had gonorrhea three times before his marriage, which occurred when he was 29. Lues was denied; he had two healthy children. His first illness was an attack of typhoid fever at 35, during which he was treated at home and in which he was delirious at times. He had been a moderate user of alcohol, but had used tobacco very freely, probably chewing to excess. He stated he had been moderate in his sexual indulgences. History was negative as to religion and social disposition. From 21 until 42, or until ten months before admission, he was an engine man for the Baltimore and Ohio, being discharged for causing a wreck by falling asleep at his post. An effort was made to ascertain the amount of damage caused, but this was found to entail more search of records than the subject was worth. It was found, however, that the wreck was a "side-swipe" and probably not very serious and that the patient had been given relief until his discharge two months later. Following his discharge he invested in a small confectionery establishment, but he now thought that he would lose his money. The loss of his position worried him and he stated that he had been irritable for some time. He denied loss of consciousness, but admitted that there had been times when he had not known that he had done things, and forgot what he had gone for when he reached his storeroom. He thought that perhaps he might have been in "a study" at the time of the accident and not asleep, but from a feeling of shame told the railroad officials that he was asleep. From the patient's wife it was learned that since a wreck on June 22, 1903, when he was pinned under his engine for twenty-seven minutes, he had been absent-minded and she would have to see that he took his watch, switch-key and lunch basket when he went to work and that he wound his watch. She also spoke of his changed disposition, saying that he had become irritable, and that at times he did not appear to understand what was said to him and would ask the speaker to repeat what had been said. At times he had "an unnatural look;" "he looks wild and his eyelids look red and swollen." The patient said that occasionally he found that he had done something without having any recollection of having done it.

Examination.—Physically the patient was a well nourished man with a florid complexion. Tongue was protruded straight, was clean and showed slight tremor and slight tongue tie. Speech was negative. Reflexes were slightly below normal. Pupillary reflexes were apparently normal. Romberg's sign not present. Examination in the ophthalmologic department showed a hypermetropia and chronic conjunctivitis, for which he was given glasses and an eyewash. He also complained of tinnitus and was referred to the otologic department, where a chronic catarrhal otitis media was diagnosed and treated.

The man was seen but three times and he probably moved to Pennsylvania, where he expected to receive financial assistance from relatives.

Diagnosis.—From the above history and my personal observation of the patient I am inclined to make a diagnosis of psychic epilepsy, probably of traumatic origin, though I should liked to have had a further period of observation in order to have been quite positive as to the diagnosis.

I cite the case to illustrate three points: first, a nervous disease in an engine man probably caused the railroad two wrecks, and it is probable that chance determined that they were not greater; second, the tests which have been suggested above would not have been sufficient to cause the detection of the disease and, therefore, even were they carried out as a routine, a number of men unfitted to hold responsible positions would continue to hold them; third, it partly shows the mental attitude of the man toward the officials and his mates, he preferring to state falsely that he had been asleep rather than to confess having periods of unconsciousness which he could not explain, and preferring not to seek advice through fear, possibly, of losing his position.

CASE 2.—Patient.—Walter J., a white man, aged 48, married, and a captain of a coast steamship, was admitted to the Johns Hopkins Hospital Dispensary Oct. 30, 1908, complaining of nervousness. His family history was negative.

History.—The patient had had three attacks of gonorrhea, had suffered from rheumatism for years, and at one time was alcoholic to a mild degree. He had been operated on for appendicitis ten years previously. He had five children, all of whom were living and well. The patient said that he had been feeling bad for a month and a half, having a poor appetite and being unable to sleep. He denied any attacks of unconsciousness.

Examination.—The patient was a well-nourished and thick-set man with a ruddy complexion; looked a little below his age. He showed a marked speech defect, stumbling over the usual test words. Pupils were regular in outline and reacted rather sluggishly to light. Tongue deviated to the right and was tremulous. There was a marked tremor of the extended hands. Writing also showed a coarse tremor. Gait was rather unsteady and there was some swaying. The right knee-jerk was somewhat more brisk than the left. Later all tendon reflexes were exaggerated.

It is this case which serves as a text for the many questions which may be suggested by the title of this paper.

I did not see the patient at his first visit to the dispensary and when it was found that he was able and willing to pay he was referred to a colleague of mine under whose care he has since been. I have examined him twice at intervals of several months and while at the second examination he showed a considerable improvement, I am nevertheless of the opinion that his is a case of paresis of a slow course. As captain of a steamer he was responsible for a crew of about forty and passengers from 4 to 80. Here was clearly a case in which our moral duty demanded that something should be done to prevent his longer continuing in so responsible a position and he was accordingly advised to take a vacation, which he did; but after several weeks, during which his improvement had taken place, he became impatient of idleness and returned to his position. On account of the libel law of Maryland, which is an extremely delicate affair, none of us felt like saying to the patient that he positively had paresis, nor did we wish to go to the man's employers and warn them. Finally, however, this step was taken and one of us who personally knew the head of the steamship company told him of the case and suggested that the patient be ordered to have a medical examination. Unfortunately this was not done with the finesse that it might have and the patient came back at us for an explanation. Matters were easily arranged, however, and my colleague and another went to the patient's house to make a lumbar puncture. On the result of this, all of us who were interested in the case put considerable faith, and it is therefore extremely unfortunate it should have resulted in a dry tap, due principally to the fact that the patient, who is a large man, was unable to bend his spine and allow the needle to enter.

At the present time the patient is back at his work in a responsible position, but it seems to me that the danger of this course is very slight as he is seen between each trip and has himself been warned to be careful and to turn the boat over to his mate should certain symptoms occur.

I must confess that the pleasure of a trip on his boat would be considerably marred to me by my anxiety lest he make some of those defects of judgment to which paretics are so prone, but the man must make his living and there seems to be no other course to follow.

It seems to me that the simplest thing which railroads might do in order to minimize the danger of using a man who is nervously unfit to run their trains would be to institute tests of reaction time, repeated quarterly perhaps, the stimulus being the display of a red and a green light, the patient to make different movements, which should be recorded by a chronoscope. The same device could be used for steamship captains and pilots, while for those accustomed to follow auditory signals auditory stimuli could be used.

Should an individual show a slowing of reaction a neurologic examination might be made and the cause of such slowing learned if possible. Such procedure probably would be more satisfactory than the recording of the few tests which I have suggested and which would

necessarily be conducted by a number of men who are probably unskilled in the employment of such tests.

The second case history which I have detailed brings up several questions concerning which a great deal might be said. Our action in notifying the man's employers that he was probably suffering from paresis and was, therefore, an unsafe employé may be viewed by many as a violation of professional secrecy. By such action one of us at least made himself liable to a criminal prosecution and to damages. On the other hand, it would seem that by every moral law such action was justifiable.

Considerable time might be spent in discussing the subject of professional secrecy and this paper might be expanded far beyond its present size merely by giving a summary of some of the papers which have appeared on the subject in the past ten years, but unfortunately such a summary would not bring us much nearer to a solution of the question.

By the Hippocratic oath the physician binds himself to secrecy. "My tongue shall be silent as to the secrets which are confided to me and I will not use my profession to corrupt manners or aid crime." The last clause, "to prevent crime," in many instances will serve as an excuse or reason for violating professional secrecy; but in the present case it seems to me doubtful if we can consider that a crime is about to be committed and our only excuse was "the greatest good to the greatest number," and possibly the Golden Rule. I am not quite sure whether even the last will serve us, for while I would feel grateful to any one who would save me from any act by which I might work harm to others, yet I probably would resent such interference if it meant the loss of my position and the impairment of the livelihood of myself and family. So that without spending considerable time in arguing the question, we are reduced to the single excuse of the "greatest good to the greatest number." This must be the excuse for violation of professional secrecy in many cases, but no rule can be given and each case that we meet with must be decided of itself.

Perhaps enough has been said of the moral and ethical side of the question, but considerable more might be added.

On the purely legal side, it must be remembered that in this country each state has different laws in regard to the professional relations which a physician bears to his patient. Before taking any step which entails a violation of professional secrecy it would be well to look up the state law with its definitions and penalties, and thus learn of the risks that will be incurred. It takes but slight study of the literature or but a few moments' talk with a lawyer to learn that each case must be decided of itself and that no hard and fast rules can be laid down.

Becker,⁴ in considering the question in quite a narrow sense, concludes with the observation: "In all statutory enactments in a free country the test of the law must be whether it works the greatest good to the greatest number."

"Apply that test to the statutes under consideration in this paper for yourselves, and no doubt you will reach such a conclusion as will be eminently satisfactory to the dictates of professional etiquette, and to the

duty that you owe to yourselves, your employers and to the public sentiment."

Tait⁵ gives a number of instances which illustrate some of the difficulties which beset the question. His paper is well worth reading.

Nichols,⁶ Benedict⁷ and McKee⁸ give illustrative cases with brief discussions which furnish considerable food for thought and probably will be of greater value to those who desire to look up the matter than the papers previously cited.

Morrow,⁹ while dealing with the question in a limited sphere, has written an excellent paper and in the beginning lays down some broad principles which will be helpful to all.

I have not quoted any foreign papers, as the laws of Great Britain and France are quite different from those of this country.

As conclusion to the present paper I would say that if a physician has as a patient a person unfit to hold a responsible position and a menace to public safety he should endeavor to have the patient voluntarily give up such a position, or if circumstances are such that there is no immediate danger the patient may continue in it under observation. If the last is impracticable and if the patient refuses to be guided by medical advice, some steps should be taken to have the patient removed from this position. We physicians should also endeavor to have transportation companies institute such tests as will insure against the employment of those likely to be a menace to public safety.

The Treatment of Cholera.—At the session of the Royal Society of England, Jan. 28, 1909 (*Nature*, February 25), Prof. L. Rogers offered a communication on the composition and pressure of the blood in cholera and the use of hypertonic solutions in its treatment, based on experience in India. The blood of Bengalis has been found by Captain Mackay to contain a higher proportion of salts and a smaller proportion of erythrocytes than that of Europeans, and Rogers has found that their blood pressure is lower. In cholera the enormous secretion of fluid into the bowel drains away the fluid part of the blood and there is a very definite relationship between the amount of fluid thus lost and the severity and mortality of the disease. Injections of normal salt solution (0.65 per cent. of sodium chlorid) into the veins has an almost miraculous effect, but this is only transitory and in the course of a few hours the symptoms recur. It occurred to Rogers that if he were to inject the hypertonic solution of 1.35 per cent. there would be less likelihood of the diarrhea recurring. This treatment simply revolutionized the results and instead of being a rarity the recovery of collapsed patients is a rule. In severe cases the proportion of chlorids in the blood falls below normal in spite of the concentration from loss of water, and he therefore sometimes uses a saline solution of 1.65, but usually 1.35 is sufficient. In bad cases the coagulability of the blood is greatly reduced and he now generally adds three grains of calcium chlorid to a pint of saline solution. Uremia is likely to occur in the reaction stage of cholera and is associated with a comparatively low blood pressure; and the hypodermic administration of adrenalin and digitalis is indicated for the prevention of this serious complication.

Clinical Notes

FLANNEL BANDAGES FOR CLINIC USE

HENRY MELVILLE CHASE, M.D.

Assistant-Surgeon to The Boston Dispensary
BOSTON

Expense of material is frequently an important factor in providing generously for use in a clinic. Conditions requiring the application of a firm even bandage, for which the usual cotton roller is not best suited and for which the flannel bandage (strictly speaking) is too heavy, warm and expensive for constant use, can be provided for by bandages prepared from medium-weight shaker flannel. A bolt is usually 50 to 56 yards in length and 24 to 26 inches in width. My custom has been to buy a "Berlin domet" shaker flannel, which is 26 inches wide and costs $4\frac{1}{2}$ cents a yard. The bolt of goods is cut into seven strips, each eight yards long, which are then rolled compactly. The length of each roll, 26 inches, is equal to the width of the goods, which will allow the selvages to be trimmed off and leave sufficient to cut into 8 three-inch sections. Each roll is placed in the device shown in the illustration and cut with any long carving-knife, the edge of which is kept roughly sharpened with an emery stick. The strip of goods in each section is then put on a bandage roller and forms a compact bandage 8 yards long and 3 inches

Device used in cutting rolls of flannel for bandages. It is made out of half-inch lumber and consists of the following parts, the measurements being in inches: One bottom piece (b) $12\frac{1}{4}$ by $3\frac{3}{4}$; two side pieces (s) each 9 by $2\frac{1}{2}$; two short side pieces (s') each 3 by $2\frac{1}{2}$; one top piece (t) 9 by $4\frac{1}{4}$ and short top piece (t') 3 by $4\frac{1}{4}$.

wide. This quality of material may be laundered very nicely and can be used many times. The expense is \$2.52 for one bolt of shaker flannel 56 yards long. This supplies 7 eight-yard lengths; 8 bandages from each length makes 56 bandages, each costing $4\frac{1}{2}$ cents. If it is necessary for the patients to purchase their own supplies, it gives excellent material much cheaper than it can be otherwise obtained.

The device for cutting the roll into sections is simple, of economic construction and of practical application.

A NEW HEMORRHOIDAL CLAMP AND SPECULUM

B. F. JENNESS, M.D.

Passed Assistant Surgeon, U. S. Navy
SAN FRANCISCO

This instrument was devised for a clamp and suture operation described by me in the *Naval Medical Bulletin*, October, 1908. It has the following advantages, in all hemorrhoid operations, over the clamps now in general use:

1. The clamp and speculum are combined.
2. The natal curve of handles gives access to operative field.

3. The slender jaws produce less extensive area of crushed tissue.

4. The angle of jaw and curve of handles prevent dragging on the tumor by weight of instrument, as the instrument in position rests on the buttocks and sacrum.

5. The closed end of speculum prevents soiling of the operative field from possible contents of the upper rectum.

6. The speculum obviates the necessity for drawing the hemorrhoid down with forceps, as high tumors can be treated through speculum.

7. The speculum protects the rectal tissues while cautery is in use.

8. The instrument can be introduced, applied, and removed with one hand.

The instrument is fitted with two steel reversible and detachable blades, so that a serviceable speculum can be attached to the jaws of the clamp for either side of the rectum.

The clamp is introduced into the rectum closed, with the speculum directed to the opposite side from that

A new hemorrhoidal clamp and speculum.

on which the pile to be clamped is located. The jaws are slowly opened and the hemorrhoid allowed to slip between them to the extent desired, or the process may be aided by a pair of dressing forceps. The hemorrhoid is clamped by approximating the handles of the instrument, which are fitted with a ratchet catch. The hemorrhoid can then be treated through the speculum, and the jaws released by drawing down the ratchet guide.

In the clamp and suture operation the advantages of the instrument lie in the special curve of the handles which facilitates the suturing, and the slender jaws which permit manipulation with needle and holder behind them.

As the use of the cautery is not necessary in the suture operation, the speculum is removed, and the instrument is more easily turned to permit entrance of the needle on the upper and lower surface of the pedicle, respectively, during the progress of suturing.

The use of a long-bladed hemostat as a needle holder and of a short, curved needle will facilitate the suturing.

The instrument with speculum attached weighs seven ounces. The center of gravity passes through the joint, so that the instrument in position hangs in the rectum and requires no other support.

Each blade of the speculum is fitted with a steel pin at the base, which slides into a canal at the bottom of a

groove in the jaw. This pin secures the blade in position.

The crushing surface of the jaws measures $2\frac{5}{8}$ inches in length and $3/16$ of an inch in width. The instrument measures $6\frac{7}{8}$ inches from joint to handle tip.

TWO CASES SUGGESTIVE OF SPECIFIC GENERAL AND FOCAL REACTIONS AFTER VON PIRQUET'S CUTANEOUS TEST

CHARLES RAYEVSKY, M.D.

LIBERTY, N. Y.

The discovery by von Pirquet of the cutaneous reaction, by Calmette and Wolff-Eisner of the ophthalmic, and by Moro of the percutaneous, have been hailed with joy and satisfaction. In reporting on them, men of wide experience and learning have been careful to observe that the usefulness of the tests is not fully established, but almost every one has expressed great satisfaction that they give no alarming general symptoms and that they are perfectly harmless.

Together with others, I have been enthusiastic over them and applied them in several cases, before resorting to the old method of injecting T. O., and I had the opportunity to observe two specific reactions after the application of the von Pirquet test. In both cases there was also the specific reaction in the foci of the disease. I, therefore, call them "focal reactions." Following is the history of the two cases:

CASE 1.—November, 1908. *Patient.*—F., Irish-American; aged 27; bookkeeper; brother died of tuberculosis; sister was suffering from it; mother died young, cause unknown; father living, aged 64; healthy; two brothers living and healthy. The patient had a few night sweats during August; felt weak, but noticed no other symptom. He feared tuberculosis and was examined by several doctors; results were negative. Sputum was examined several times, by myself among others, with negative results. There was loss of one or two pounds of flesh during long intermissions, but rapid return to original weight.

Present State.—Pulse, 84. Temperature, 98.2 to 98.6, taken for three days. Chest expansion, $3\frac{1}{4}$ inches. Respiration, 19. Height, 5 feet $5\frac{1}{4}$ inches. Weight, 152 pounds. Body well nourished; appetite and digestion good; no cough and no expectoration except on rare occasions in the morning. Physical examination revealed nothing of significance.

Von Pirquet Test.—November 12, about noon, the von Pirquet test was applied in the usual manner, care being taken that there should be no extravasation of blood by the scarification. In the evening the patient complained of an uncomfortable feeling in the chest; coughed; temperature 100.4; pulse, 96. There was no evidence of a cutaneous reaction. I examined his chest, but noted no other signs outside of harsh breathing in the right apex. The fever left the patient about nineteen hours after the application of the test. He had a good night's rest, but felt somewhat tired in the morning. After having a good breakfast, however, he felt as well as ever. Cutaneous reaction was looked for, but not found. Before resorting to the T. O. diagnosis, another specimen of patient's sputum was examined and revealed the presence of tubercle bacilli to the number of one to three in every third or fourth field. About thirty fields were examined. The sputum was centrifuged and washed. The fever, the harsh breathing in right apex, the oppressive feeling in chest and other phenomena were therefore due to the action of tuberculin absorbed through the skin.

CASE 2.—March 29, 1909. *Patient.*—Mrs. M. B., American; aged 35; married; was engaged in light housekeeping; husband healthy; father died at 48; mother at 42; both of some lung disease; deaths about two years apart. One brother died

recently of laryngeal tuberculosis. No other members of the family living. The patient's voice became husky some three or four months previous to examination. There was also some pain on deglutition, mostly a burning and lump sensation in the throat. The patient had night sweats for one week; lost some flesh, but regained it quickly; became hoarse for a day or two every ten or fourteen days; did not think she had had fever at any time.

Present State.—Pulse, 108. Temperature for three days, 98, a. m., 98.6, p. m. Respiration, 20. Chest expansion, $2\frac{1}{4}$ inches. Height, 5 feet $3\frac{1}{2}$ inches. Weight 128 $\frac{1}{2}$ pounds. The patient complained of no pain; coughed sometimes in the morning; expectoration was scanty; appetite and digestion fair; microscopic examination of sputum revealed numerous streptococci and staphylococci, but no tubercle bacilli. Sputum was centrifuged and washed as usual. Physical examination of chest revealed nothing; laryngoscope showed just a slight pallor of tissues.

Von Pirquet Test.—This was administered in the usual manner. Eight hours after the test I found the patient in bed. Her face was very much flushed with a cyanotic hue; she felt sick and vomited; her voice was hoarse; she complained of oppressive feeling in the chest, especially on the right side; had pain in her throat, even on drinking water; could not take food; coughed and expectorated thick "chunks." Pulse 140. Temperature, 102.6. Respiration, 28. Physical examination revealed moist râles in right apex. Laryngoscopic examination, made early next morning, about eighteen hours after inoculation, revealed hyperemic patches over epiglottis and the right rima glottidis; magnifying mirror was used and the hyperemic spots gave the appearance of papilla or small dots closely resembling the strawberry tongue in scarlet fever, but they had a bluish tint. Temperature went up to 104 within twenty-four hours, but declined rapidly. Within six hours (thirty hours after inoculation) it came down to 99.8. The decline afterward was more slow and in twelve hours it came down to normal (forty-two hours after the inoculation), and in fifty-six hours after the inoculation the patient felt well. This was certainly a specific reaction due to the tuberculin, the severity probably being increased by the mixed infection.

After observing these two reactions, I concluded that they were due to the specific reaction of the tuberculin applied according to von Pirquet's method.

When we analyze clearly what we administer in the von Pirquet test we need not be surprised at this reaction. One drop of a 25 per cent. solution of T. O. is usually employed. This represents 15 mg. of tuberculin, if all of it should be absorbed by the skin. One-half of the tuberculin, let us suppose, is left on the applicator, which is used to rub in the tuberculin; let us further allow that one-half of the remainder goes also to waste; still there is left 3.75 mg. to be absorbed by the skin, if the skin absorbs it at all. If the skin does absorb it, an initial dose of 3.75 mg. is certainly too high. But observers have so far seen no ill effects from the cutaneous reaction. I have also employed it in several cases with no bad results. The question that I wish to raise is: What is really the effect of the tuberculin on the skin? Has the reddened surface around the inoculated spot anything in common with the specific tuberculin reaction, or does it act only as an ordinary irritant on the skin that may possess more or less sensibility to its irritation? If so, we should get the cutaneous phenomena in positively non-tuberculous individuals, whose skin is sensitive to tuberculin.

Bandelier and Roepke seem to hold that view. In their "Lehrbuch der spezifischen Diagnostik und Therapie der Tuberkulose" they make the following statement while discussing the von Pirquet test, though with another object than mine:

Von nicht tuberkulösen Kindern 16 per cent. typische Hautreaktion zeigten; nicht tuberkulöse Erwachsene und grössere Kinder reagiren sehr leicht bezw. ohne Ausnahme.

I do not deny that there is some significance in the cutaneous reaction, but its significance when the reaction is only cutaneous is possibly non-specific, and when the reaction through some peculiarity of the skin of the tested individual becomes specific it may be violent and, therefore, dangerous, as the dose is too high and can not be graded. Whatever was said in reference to the cutaneous reaction, relates also, though not to the same extent, to the ophthalmic. In the ophthalmic test we use two minims ordinarily of 1 per cent. solution of *pure* tuberculin, or 1.2 of *pure* tuberculin. If we should suppose that half of it was wasted, and this is hardly the case, as we use no applicator with it, but drop it directly into the conjunctival sac, hold it for a few seconds until it spreads all over—then we instil into the conjunctiva, a membrane of great absorbent powers, 0.6 mg., a dose which is too high for the initial dose. If it gives no general or focal specific reaction the fault is not ours, but in all probability that the tuberculin acts in the conjunctiva only as an irritant, and the more sensitive and prone to irritation the conjunctiva is the more or less pronounced will be the conjunctivitis, irrespective of the circumstances, whether the subject tested is tuberculous or not.

Whatever was said about the cutaneous and ophthalmic reactions relates also to the Moro test.

84 Academy street.

A CASE OF BILATERAL RENAL CALCULI

DANIEL N. EISENDRATH, A.B., M.D.
CHICAGO

The following case illustrates the necessity of taking skiagraphs of both kidneys in every case of suspected renal calculi. It is a generally accepted fact that the simultaneous presence of calculi in both kidneys is not so rare as was formerly thought. It has been estimated to occur in from 15 to 20 per cent. of cases of nephrolithiasis. It is of the utmost importance to ascertain the bilateral presence of calculi, owing to the frequency with which anuria may occur, with obstruction of the ureter of one side and reflex inhibition of the functional activity of the opposite kidney or cessation of the secretory functions of the latter as the result of blocking of its ureter by a calculus. It is beyond the province of this brief clinical report to discuss the advisability of operating on one or both kidneys at the same sitting. At present I am inclined to believe that the method pursued in this case of operating at an interval of four to six weeks is the safer one. The history of my case is as follows:

History.—E. H., aged 20, was referred by Dr. Mortimer Frank of Chicago. In 1903 (five years prior to my first examination) the patient began to have pains alternately over the right and left lumbar regions. Up to one year before my examination the pain had been chiefly in the right side, but during the year preceding my examination the pain had been confined to the left side. The pain was of an aching character, lasting several hours, and localized over the left kidney. The urine had been cloudy for past four years. Neither blood nor calculi were ever passed until July, 1908, when he had severe pain over the left kidney for three days, accompanied by chills, fever and the passage of a few small calculi and some blood, the last-named symptom persisting for one day. Since this attack pain occurred only on the left side. Skiagraphs, taken separately of the right and left kidneys, revealed the presence of undoubted stone shadows in both. Functional tests with

indigo-carmin and phloridzin showed both kidneys of about equal functional capacity.

First Operation.—The calculi were removed from the left kidney on Oct. 30, 1908. The kidney was converted into a number of hydronephrotic cavities, with only a narrow rim of parenchyma. After splitting the kidney in the median line of its convexity, thirteen calculi were found. One of these almost completely blocked the pelvic orifice of the ureter. The remainder of the calculi were found in the greatly dilated calices of the hydronephrotic kidney. On account of the presence of a fair amount of good parenchyma at the upper and lower poles, it was deemed best not to remove the kidney.

The patient recovered very rapidly from this operation and left the hospital on Nov. 26, 1908.

Second Operation.—He re-entered the Michael Reese Hospital on Feb. 3, 1909, to have the calculi removed from the right kidney. Nephrotomy on this side was performed in the usual manner, and six calculi, varying in size from a pea to a lima bean, were removed. One of these calculi incompletely blocked the pelvic orifice of the ureter, as in the other kidney. This right kidney showed even more advanced changes than the left. It was greatly sacculated, so that the calculi could be readily palpated through its thin walls. The parenchyma was apparently destroyed in the upper half, the only functioning portion being in the lower half. One stone, the size of a hazel nut, was in the lower pole near the cortex; a second, the size of a hickory-nut, lay in the pelvis, and a third large stone was in the upper pole. The other three calculi lay in the sacs near the cortex.

The patient also made an uneventful recovery from this second nephrotomy and returned to work four weeks later. The wound was healed six weeks after the operation. He has gained greatly in weight and color.

103 State street.

TRYPSIN IN POSTOPERATIVE TREATMENT OF CARCINOMA OF BREAST

JOSEPH JEROME CRONIN, M.D.
ROXBURY, MASS.

History.—On Sept. 17, 1907, I was called to see Mrs. S., aged 62, who had a growth in the left breast and considerable pain. She said it had been growing for more than a year, but she had never consulted a physician about it. On examination I found the breast very large with skin adherent for some distance around the nipple area, and several thickened carcinomatous patches in the skin. The glands in the neck and axilla were much enlarged. I advised immediate operation, but the patient was opposed to this. I saw her again on Sept. 28, 1907. The pain had increased a great deal and the patient had considerable vomiting, complained of chills and had an unquenchable thirst. She had the typical cachectic color. The skin showed more thickening and discoloration. I removed the breast by the usual radical operation on October 3, removing all the glands in the axilla and a large area of skin. I obtained primary union in the usual time, but the patient had failed a great deal since the operation. A general toxemia, probably due to the cancer, had been present since before the operation. The patient had a temperature of 100 to 101 and always a rapid pulse, with persistent st. She failed rapidly in weight and of urine, stools and stomach contents, from time to time, showed nothing abnormal.

Use of Trypsin.—On Feb. 3, 1908, I began the use of trypsin and amylpsin. The patient stood the treatment very well; had no local reaction or abscesses. After a few months, vomiting ceased except at intervals, when an injection of amylpsin would seem to control it for another period. The patient has now had no treatment since Nov. 11, 1908; is down stairs every day and assists occasionally in light housework. Her appetite is much improved. She is in better condition since the operation and the treatment has certainly helped her.

It is certainly well worth a trial, and I am now using it in two more cases, but it is too early as yet to make any deduction in these cases.

MUCOUS COLITIS: APPENDICOSTOMY

REPORT OF CASE

JOHN M. LITTLE, JR, M.D.

ST. ANTHONY, NORTH NEWFOUNDLAND

I have read with interest the preliminary report¹ by Dr. Reed of the case of mucous colitis treated by bacterial injections through the appendix. Mr. Dawson² gives a very full account of appendicostomy and the surgical aspect of colitis, and mentions also the treatment of mucous colitis based on the well-known work of Metchnikoff. It is to be hoped that a larger experience may lead to a better understanding and treatment of this condition. Meanwhile appendicostomy, judged by the few cases reported, offers promise of success. There are too few cases as yet on record, or followed for a long enough time, to point to definite conclusions.

For this reason the following is reported. The improvement, which, following the operation, has been marked and steady, is independent of bacterial therapeutics, unless the mechanical factors have brought about conditions under which the normal intestinal fauna and flora have reinstated themselves.

Patient.—G. B. (Hospital Record No. 303), aged 40, a well-to-do skipper, fisherman, with unimportant family history, had had the best of everything in his living, had always been well and strong, and considered himself exceptionally hearty till his present illness. His average weight was 220 pounds.

Present Illness.—Ten months before coming to the hospital he began to have vague pains in his abdomen and back and to feel weak and unable to work. About the same time he began to have constipation for four or five days at a time, alternating with diarrhea, with loss of appetite and indigestion. He was treated by his family physician, but received no benefit. In June, 1908, he went as skipper of his own vessel, but felt miserable all the time. By the last of June he felt he must "give up." He saw Dr. Hare at Harrington Hospital, who sent him home, put him on a diet and rectal injections, and told him he must go to a hospital. He followed instructions, but without benefit. He had been passing masses of peculiar appearance, something like "squids." He had lost steadily during the six months before coming to the hospital, the falling-off in weight amounting to forty pounds. He had never been nervous and was not then, but was willing to do anything to get well, as he wanted to resume work. He entered St. Anthony's Hospital Oct. 27, 1908.

Examination.—The patient was a well-developed and well-nourished, very strong, hearty-looking man. One would not imagine that anything could be wrong with him. Temperature, pulse and respiration were normal. The chest was normal; the abdomen, aside from a little tenderness on the right side on deep pressure, was normal. The rectum was empty and collapsed. The urine was acid; specific gravity, 1.018; no albumin and sugar.

Course of Disease.—The patient was put to bed and given a light diet and cathartic. On October 29 he passed voluminous stools with much shiny mucus in lumps and shreds, and on October 31 a very tenacious mucous cast a foot long. The patient was weak. An alum enema was given daily as high as possible. On November 9 the patient was sent home with instructions as to treatment and directions to return in two weeks for operation if no benefit was felt. His weight on admission was 184 pounds; on return home, 179 pounds. On November 24 he was readmitted weighing 174 pounds. He felt about the same: complained of swelling of the bowels and lameness along the course of the descending colon, where he had slight tenderness on deep pressure. His bowels had been more regular, but he had passed "squid-like" stools. His appetite was poor and he had a bad taste in his mouth.

Operation.—On November 26, under ether, a gridiron incision was made at McBurney's point, the abdominal cavity thoroughly explored and everything found normal. The appendix, which was normal, was picked up into the lower angle of the wound. The mesoappendix was very fat and was therefore tied off down to a point just within the tendons of the external oblique muscle (1 inch). It was stitched in place by two silk sutures through the muscular layer of the appendix and skin. The wound was then sutured in layers, care being taken to have the cecum close against the abdominal wall, where it came easily, and no tension or constriction of the appendix. The tip of the appendix, in which the circulation seemed good, was wrapped in gutta-percha tissue. Dry dressing was applied and the patient put to bed in good condition. He made a good recovery from the ether with very little nausea. On November 30 the end of the appendix, which was looking dark, was cut off level with the skin and a soft rubber catheter inserted. The patient felt no sensation as the appendix was cut and dilated. A small amount of gas escaped through the catheter.

Postoperative Treatment and History.—On December 1 soapy water was passed into the cecum through the catheter. After a quart had been run in slowly there was discomfort and the patient vomited twice; the flow was then stopped. In five minutes the patient had a voluminous movement into the bedpan of hard fecal masses, mucus, soft feces and soapy water, experiencing immediate relief. The irrigation was continued, the patient being comfortable and expelling the feces and fluid at short intervals until the water came away almost as clean as it went in. About eight quarts were used. On December 4 the patient was up and dressed. The irrigations had been continued twice daily without trouble or discomfort. On December 10 the patient was up and about, feeling better. He performed the irrigation daily himself, sitting on the closet, and using five to six quarts of water, followed every third day by ten ounces of 0.5 per cent. solution of silver nitrate. The end of the stump of the appendix sloughed off, but there was no trouble in passing the catheter. From now on, with the exception of a small stitch abscess which soon cleared up, the convalescence was uninterrupted. By January 8 the patient was leading a fairly active life, began to feel better and had a good appetite. His weight had steadily increased from 174 to 186 pounds. There was no leakage of feces or gas from the opening; the catheter was passed with ease. There was still considerable slimy mucus in the stools, but not in lumps and masses. The patient decided to go home, to return in the spring for examination and closure of the fistula if he was well enough. He would prefer to have a fistula permanently, since it was no trouble to him, rather than be as he was before. He thought that he would be able to go "sealing" in March if he kept on improving as he had in the last two weeks.

Last Report (made on correcting proof, June 4, 1909.)—I have to-day examined the patient. He seems well in every way and weighs 217 pounds. He has worn a catheter in the appendix up to date, as he did not wish the hole to close. He is leading an active life. He notices nothing abnormal about his stool. He has been advised to give up the catheter and allow the appendicostomy opening to contract. He will report at intervals and return for treatment on any recurrence of his former trouble.

Pin (Supposed to Have Been Swallowed) Found in Bladder.—Dr. C. S. Austin, of Carrollton, Missouri, reports the case of a 14-year-old boy, previously healthy, who suddenly developed symptoms of cystitis. The patient was treated by several physicians for almost a year without benefit, and had become weak and anemic. Dr. Austin, on examination, discovered a foreign body in the bladder, and at length was able to remove a large pin, the point and head exposed and rusty, and the shaft covered with a rough, uneven calcareous deposit to the thickness of a lead pencil. The patient then recalled that he had swallowed a pin about a year previous to the first appearance of the symptoms, or about two years previous to the operation. With the extraction of the pin, all unpleasant symptoms ceased and the patient soon regained his health.

Therapeutics

TINEA CRURIS: RINGWORM OF THE LEG

This is a disease that has lately attacked in epidemic form the students of universities and preparatory schools. It occurs on the inner side of the thighs near the body, often spreading to the scrotum, to the abdomen, to the perineum, and to the buttocks. The hairs do not fall out, thus differing from the ringworm that attacks the scalp and other parts of the body. There is slight itching and burning, but the disease may go on for weeks and even months without very much disturbance to the patient. It does not tend to recovery, and will persist until properly treated. In fact, the treatments outlined by most of the books on skin diseases are tediously ineffectual, and the statement is often made that a cure of the disease requires weeks and even months of treatment. Consequently, ordinary treatments of this disease are so unsatisfactory as to be considered of no value.

The following treatment is one that is always effective and always curative in a short space of time. In the first place, it must be impressed on the patient that reinfection readily and almost persistently occurs unless the greatest cleanliness of the underclothing and even trousers is inaugurated. Also, it is evidently transmitted from patient to patient from the closet seats. Dirty jock straps and suspensory bandages used in athletics are persistent transmitters of the disease. Therefore, clean clothing must be worn after all the washable clothing has been boiled and the trousers have been properly cleaned and properly ironed. Closets must be rendered aseptic by frequent corrosive sublimate baths.

The patient should then be instructed to come to the office, bringing clean drawers and a clean shirt, so that after the antiseptic treatment he can put on clothing that is not infected. The different steps in the antiseptic process are:

1. The parts are all thoroughly cleansed with a soft brush or cotton, and liquid soap, and the skin for four or five inches distance from the infected areas should also be cleansed with this soap. The scrubbing should not be very severe, as the skin must not be broken and the epidermis not too severely removed.

2. The infected area should then be wiped over thoroughly with a 2.5 per cent. phenol solution. This will slightly anesthetize the parts to which the stronger antiseptic is to be applied.

3. A cotton swab is now wet with the official formaldehyd solution. This is then lightly swabbed over all the infected parts, which are kept wet for three minutes, provided the patient can stand the burning pain for this length of time. If there is an area that is especially red and inflamed and sensitive, this part may be swabbed with the next solution mentioned before the three minutes have elapsed.

4. The whole area to which the formaldehyd solution has been applied is now thoroughly washed with the 2.5 per cent. phenol solution. This quickly relieves the pain caused by the formalin application.

5. After the burning pain has ceased, the skin is gently dried and talcum powder is dusted over it. The patient then dresses in his clean clothing and takes care that he does not come in contact with any infected garments, beds or closets.

6. After twenty-four hours the patient should report for observation. If severe irritation has been caused by the formaldehyd solution, a 2 per cent. phenol ointment

should be applied. If there is not severe irritation or inflammation, the simple talcum dusting powder is to be freely used.

7. At the end of a week the patient is again examined, and if there are any recurrent small areas, which may happen at the margins of the affected region, these are again touched with the formaldehyd solution.

By the above treatment a cure may be expected immediately and certainly within two weeks. The success of the antiseptic treatment is certainly far in advance of the ordinary treatments of this inveterate disease.

The preparations advised are as follows:

R.		c.c.		
Phenolis liquefacti	2	50	or	m. xlv
Aque. ad	100			ad, fl. 3iv
M. et Sig.:	2.5 per cent. carbolic acid solution.			
R.		c.c.		
Liquoris formaldehydi	100		or	fl. 3iii
Sig.:	Official formaldehyd solution.			
R.		gm. or c.c.		
Phenolis liquefacti	2	50	or	m. x
Petrolati	25			5i
M. et Sig.:	Apply externally as directed.			

In an article on this subject in the *British Medical Journal*, May 8, 1909, Dr. J. O. Symes describes his treatment of this disease. He first removes the superficial epidermis with antiseptics, and uses "a solution of 40 grains of iodine with 20 grains of potassium iodide in an ounce of methylated spirit. Two applications are generally sufficient." The parts are then treated, morning and evening, with the following ointment:

R.		gm.		
Sulphuris precipitati	2			
Hydargyri ammoniati	2		or	āā, 3ss
Adipis lane hydrosi	30			5i
M. et Sig.:	Use externally.			

Sometimes the affected parts were painted every other day with a camel-hair brush soaked in oil of turpentine, and the following ointment rubbed in every night:

R.		gm.		
Sulphuris precipitati	2			
Hydargyri ammoniati	2			āā, 3ss
Acidi salicyli		60	or	gr. x
Adipis lane hydrosi	15			
Petrolati	15			āā, 3ss
M. et Sig.:	Use externally.			

The smarting caused by the applications of turpentine are relieved with petrolatum. The average duration of the treatment for a cure is three weeks.

Symes says that, while the tinea cruris resembles the tinea circinata, they are probably two distinct parasites, for, as distinct from the latter, "the tinea cruris germs do not attack the hairs, and the parasite of the tinea cruris shows a larger spore and a freer growth of mycelium than tinea megalosporon."

TINEA TONSURANS

Dr. R. L. Sutton, Kansas City, Mo. (*American Journal of the Medical Sciences*, March, 1909), describes the treatment of this obstinate and stubborn disease, especially of the scalp and bearded portions of the body. While the x-ray is now used frequently to cause the falling out of the hairs, which is so essential to the proper treatment and cure of the disease, Sutton does not advise it, as it is difficult to gauge the intensity of the action of the x-ray, and it many times requires more exposure than is advisable. Such treatment should, therefore, not be undertaken without a good deal of experience with x-ray activities. The action of the x-ray is only of advantage in removing the hairs; it does not seem to kill the fungi, although it may stimulate a

healthy inflammatory process that aids in ridding the skin of the organisms. Whether the hair is removed by x-ray action or otherwise, Sutton advises the following treatment:

The diseased surface is mopped with tincture of iodine. This is followed in a few minutes by the application of a 2 per cent. aqueous solution of corrosive sublimate (mercuric chlorid). Sutton says: "The powerful effect secured is due not to the individual action of either alone, but to a third, mercuric iodid, an extremely active and powerful, but relatively unstable salt which is formed at the points of contact." He has never seen any unpleasant symptoms occur from this treatment, but he is careful to treat only a small portion of the diseased surface at one time.

Whatever other medicaments are used, he finds that "goose grease is the best skin penetrant."

THE USE OF CHRYSAROBIN IN PSORIASIS

In the local treatment of psoriasis it should be remembered that the advantages to be gained are brought about by a stimulation of the diseased area. Reddening of the surrounding skin is no help; it is the affected areas themselves that must become hyperemic. Sometimes chrysarobin acts better in combination with other drugs, and the following combination is attributed to Drew by Walker (*Scottish Medical and Surgical Journal*, April, 1908):

R.	gm.	
Chrysarobini	20	aa, 3v
Olei rusci	20	
Acidi salicyli	10	or 3iiss
Saponis mollis	25	aa, 3vi
Petrolati	25	

M. et Sig.: Use externally on affected spots.

Walker says that this ointment will cause the healthy erythema desired in the psoriatic spots in about ten days. It is advisable for the patient to wear his ointment-soiled underclothing for another day or two; then after thoroughly bathing the disease should be found eradicated. If the disease returns, the treatment may be again instituted for a few days.

FAVUS

Favus is now often treated by causing the hair to fall out by the use of x-ray, and then the application of an antiseptic, either sulphur, ammoniated mercury, resorcin, or copper ointments.

Ignored Mumps.—It is generally supposed that no one could have mumps without knowing it, but Haury, a French army surgeon, writes to *Hygiène Générale et Appliquée*, May, to tell of an epidemic of mumps in a certain garrison in which only 4 of the men were actually conscious of having the mumps, but in 81 others more or less tumefaction of the parotid gland was evident when it was sought for, although there were no other signs of the disease. These men with ignored mumps were discovered scattered through the troop of a thousand zouaves, and were amazed at being ordered to the hospital. Examination of 380 men in a neighboring troop also revealed 24 cases of ignored mumps and 3 very mild cases with only one case in which a soldier was aware of being sick and had spontaneously applied for treatment. These abortive cases of mumps and similar diseases explain the inter-epidemic lulls and the persistence of infection, and they confirm the necessity for seeking out and isolating the only slightly affected infection carriers as the most effective prophylactic measure. In the experiences related above, the long duration of the glandular involvement was a surprise; in 58 of the men it lasted from 8 to 10 days; in 10 from 12 to 20; in 7 from 20 to 30, and in 6 from 30 to 40 days. The decided mumps lasted two months in one of the 4 acknowledged cases, but there were no general symptoms in any case.

New and Nonofficial Remedies

SINCE THE PUBLICATION OF THE BOOK "NEW AND NONOFFICIAL REMEDIES, 1909," THE FOLLOWING ARTICLES HAVE BEEN ACCEPTED BY THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION. THEIR ACCEPTANCE HAS BEEN BASED LARGELY ON EVIDENCE SUPPLIED BY THE MANUFACTURER OR HIS AGENT AND IN PART ON INVESTIGATION MADE BY OR UNDER THE DIRECTION OF THE COUNCIL. CRITICISMS AND CORRECTIONS TO AID IN THE REVISION OF THE MATTER BEFORE PUBLICATION IN THE BOOK ARE ASKED FOR.

THE COUNCIL DESIRES PHYSICIANS TO UNDERSTAND THAT THE ACCEPTANCE OF AN ARTICLE DOES NOT NECESSARILY MEAN A RECOMMENDATION, BUT THAT SO FAR AS KNOWN IT COMPLIES WITH THE RULES ADOPTED BY THE COUNCIL.

W. A. PUCKNER, SECRETARY.

(Continued from page 1929)

ACETYSALICYLIC ACID—*Acidum Acetylsalicylicum*.—*Acidum Acetylosalicylicum* (Pharm. Helvetica, edit. 4; Pharm. Danica, 1907; Pharm. Svecica, edit. 9)—*Acidum Acetylsalicylicum* (Pharm. Française, 1908)—Acetylsalicylic acid, $C_6H_7O_4$ (CH_3COO). $COOH$, 1:2 = $C_6H_5O_3$, is the acetyl derivative of salicylic acid.

Acetylsalicylic acid is prepared by the prolonged heating of 50 parts of salicylic acid and 75 parts of acetic anhydride at about 150° C. (302° F.) under a reflux condenser, and subsequent purification, by recrystallization from chloroform (U. S. patent No. 644,077).

Acetylsalicylic acid occurs in the form of small, colorless crystalline needles, with a weak acidulous taste and, at most, a slight odor of acetic acid. It is readily soluble in alcohol, ether, chloroform, hot benzol and caustic alkalies (Pharm. Helvetica). It melts at 135° C. (275° F.) and is soluble in 125 parts of cold water (Pharm. Française). It is soluble in 100 parts of water at 37° C. (98.6° F.) (Farbenfabriken).

0.5 Gm. acetylsalicylic acid, dissolved in 10 Cc. sodium hydroxide solution, heated to boiling for 2 minutes, cooled and acidified with sulphuric acid, will yield a white crystalline precipitate, which when washed and dried melts at 156°-157° C. (312.8°-314.6° F.) and when in solution produces a violet color on the addition of ferric chloride solution (salicylic acid). The filtrate from the acid has the odor of acetic acid and when c acid and alcohol yields the characteristic odor of the ethyl ester of acetic acid. 0.1 Gm. of acetylsalicylic acid dissolved in 5 Cc. alcohol, and 20 Cc. water added, should not produce a violet coloration on the addition of a drop of ferric chloride solution. If about 1 Gm. acetylsalicylic acid, carefully weighed, be boiled for 3 minutes with 15 Cc. normal alkali, then cooled and a few drops of phenolphthalein added, 38.6-38.9 Cc. tenth normal hydrochloric acid, for each gram of material used, should be required to produce a colorless solution. Acetylsalicylic acid should leave no weighable residue after ignition (Pharm. Helvetica).

Action and Uses.—It acts like salicylic acid, over which it possesses the advantage of producing less of the undesired local and systemic side effects, on account of the slow liberation of the salicylic acid. It passes the stomach practically unchanged, the complete decomposition occurring in the intestine.

Dosage.—0.3-0.1 Gm. (5-15 Grains) in capsules or wafers or dissolved in sweetened water or dry on the tongue, followed by a swallow of water.

Proprietary Preparation:

ASPIRIN.—A name applied to acetylsalicylic acid.

Manufactured by Farbenfabriken vorm. Friedr. Bayer & Co., Elberfeld, Germany (Farbenfabriken of Elberfeld Co., New York). U. S. patent No. 644,077. U. S. trademark No. 32,805.

BILE SALTS—Fairchild.—A preparation consisting essentially of sodium glycocholate and sodium taurocholate, in the proportion existing in ox bile, obtained from fresh ox-gall.

Action and Uses.—See Bile Salts, N. N. R., 1909, p. 31.

Dosage.—0.13 to 0.4 Gm. (2 to 6 grains); 4 to 5 Gm. (60 to 75 grains), per day.

Manufactured by Fairchild Bros. & Foster, New York.

ARSANILIC ACID AND ITS DERIVATIVES

Arsanilic acid is derived from arsenic acid, $AsO_3(OH)_2$, by replacing one hydroxyl by aniline (phenylamine); related compounds are made by substituting derivatives of aniline.

SODIUM ARSANILATE—*Sodii Arsanilas*.—Sodium Aniline Arsonate. Sodium Aminophenyl Arsonate. Sodium aniline arsonate, $C_6H_7(NH_2)(AsO_3OH)(ONa)$ = $C_6H_7O_2NAsNa$, is the sodium salt of arsanilic acid, $C_6H_7(NH_2)(AsO_3OH)_2$, 1:4.

It is prepared by condensing aniline and arsenic acid, eliminating water and isolating the arsanilic acids. The sodium salt is prepared by the usual methods.

Sodium arsenilate occurs as white, odorless crystals soluble in 5 or 6 parts of water and more soluble in warm water. It has a faint salty taste. On standing, the aqueous solution assumes a yellowish tint.

Sodium arsenilate crystallizes with somewhat varying amounts of water of crystallization. The arsenic content varies in different preparations from 23 to 26 per cent.

An acid solution of sodium arsenilate is not affected by hydrogen sulphide in the cold; when the solution is warmed the arsenic may be completely precipitated by hydrogen sulphide. If a solution of sodium arsenilate is treated with hydrochloric acid and potassium iodide, iodine is set free. The resulting liquid, whether freed of iodine or not, gives, even in the cold, a precipitate of arsenic sulphide when treated with hydrogen sulphide.

The arsenic and water content of sodium arsenilate may be determined by the methods given in THE JOURNAL A. M. A., Sept. 21, 1907, p. 1041.

An aqueous solution of the salt gives with mineral acids a white precipitate of arsenic acid, soluble in excess of acid. An aqueous solution of the salt gives with silver nitrate solution a white precipitate of silver arsenilate. An aqueous solution of the salt, after the addition of hydrochloric acid and sodium nitrate gives a deep red coloration with a solution of naphthol in caustic soda.

Actions and Uses.—The arsenic of the arsenic acid is liberated very slowly in the system, thus producing the ordinary therapeutic effects of arsenic, with the advantage of a more continuous and less toxic action and less irritation. Toxic effects from excessive doses have been frequently noted, although the toxicity is stated to be about 1/40 of that of arsenic trioxide. The poisonous effects appear to be due largely to the arsenic component, the aniline taking no part in them. It is claimed that the use of sodium arsenilate is not followed by irritation, abscess formation, etc., which sometimes follow the use of other preparations of arsenic. The use of sodium arsenilate in large doses has occasionally been followed by degeneration of the optic nerve leading to blindness.

It is said to have about 1/40 the toxicity of arsenic trioxide. Sodium arsenilate has been recommended for the conditions which are favorably influenced by arsenic, such as anemia, nervous affections and diseases of the skin. It is said to have been very successful as a remedy for trypanosomiasis both in animals and of man, and is also said to be useful in other protozoal diseases, as syphilis, malaria, kala-azar, etc.

Dosage.—0.02 to 0.2 Gm. (1/4 to 3 grains) hypodermically every other day, gradually increasing, if necessary, until the single dose reaches 0.65 Gm. (10 grains) and until a total of 6.5 Gm. (100 grains) have been given. The drug should not be given by the mouth, as it is decomposed by the acid contents of the stomach, and toxic symptoms may result.

Proprietary preparations:

Sodium arsenilate was first introduced in the form of *Atoxyl*.

ATOXYL.—Atoxyl is sodium arsenilate containing about 26 per cent. of arsenic and corresponding closely to the formula $C_6H_5(NH_2)$. $(AsO.OH.ONa) + 3H_2O$. It is a white powder having the properties given above.

Manufactured by Vereinigte Chemische Werke Actiengesellschaft, Charlottenburg, Germany. (Victor Koechl & Co., New York). U. S. trademark No. 38,879.

Atoxyl Hypodermic Tablets, 1/3 grain, Koechl—Each tablet contains 0.020 Gm. (1/5 grain) of atoxyl.

SOAMIN.—Soamin is a form of sodium arsenilate containing approximately 22 per cent of arsenic and corresponding to the formula $C_6H_5(NH_2)$. $(AsO.OH.ONa) + 5H_2O$. It is a white crystalline substance having the properties given above.

Tablet Soamin, 5 grains—Each tablet is said to contain 0.3 Gm. (5 grains) of soamin.

Tablet Soamin, 1 grain—Each tablet is said to contain 0.065 Gm. (1 grain) of soamin.

Manufactured by Burroughs, Wellcome & Co., London, Eng., and New York. Brit. sh. trademark No. 302,133; U. S. trademark applied for.

ARSACETIN.—Arsacetin is sodium acetyl arsenilate, $C_6H_5(NH.CH_3CO)$ $(AsO.OH.ONa)$ a compound derived from sodium arsenilate by replacing a hydrogen atom of the amino group in sodium arsenilate, with an acetyl radicle.

Arsacetin is a white crystalline substance, odorless, tasteless, and soluble to the extent of 10 per cent. in cold and 30 per cent. in hot water. It is free from arsenious or arsenic acid and solutions are not affected by boiling. It may be heated for an hour at 130° C. in the autoclave without undergoing decomposition.

Action and Uses.—See Sodium Arsenilate. It is claimed to be less toxic than sodium arsenilate and possesses the advantage of keeping well and being sterilizable without decomposition.

Dosage.—For hypodermic injection 0.1 Gm. (1 1/2 grains) to 0.5 Gm. (7 1/2 grains). For internal administration 0.05 Gm. (3/4 grain) 3 to 4 times daily. Where energetic treatment is required in syphilis or trypanosomiasis two injections a week

of 0.6 Gm. (9 grains) each, given on successive days, should be continued until 20 injections have been given.

Manufactured by Farbwerke, vorm. Meister Lucius & Brüning, Höchst am Main, Germany (Victor Koechl & Co., New York City). U. S. trademark applied for.

MERCURIC OXYCYANIDE—Hydrargyri oxycyanidum.—Hydrargyrum oxycyanatum (Pharm. Helvetica, edit. 4).

Mercuric oxycyanide, $Hg(CN)_2.HgCl_2$, is basic-mercuric cyanide.

22.2 Gm. mercuric oxide is triturated with 52 Cc. water and 12 Cc. of sodium hydroxide solution (U. S. P.) and then 27 Gm. of pulverized mercuric cyanide is added and the mixture triturated until it becomes colorless or nearly so. If the product is not entirely decolorized heating on a water bath for a short time will complete the reaction. The mixture is allowed to settle, the liquid portion decanted off and the solid residue recrystallized from hot water or is simply washed several times with cold water, collected and dried between filter papers. (Rupp and Goy, Arch. d. Pharm., 1908, p. 369.)

Mercuric oxycyanide occurs as a white, or nearly white, microcrystalline powder which colors moist litmus paper blue. It is soluble in 17 parts water.

Bolled with a mixture of sodium hydroxide, ferrous sulphate and ferric chloride solutions, cooled and then treated with hydrochloric acid, mercuric oxycyanide yields a blue precipitate. A 1 to 20 solution gives a white precipitate with ammonia water soluble in excess of the precipitant. Tannic acid solution gives a yellow precipitate. Stannous chloride produces a grey black precipitate. Hydrogen sulphide and ammonium sulphide produce a black precipitate. When potassium iodide is added to a solution of mercuric oxycyanide until it becomes yellow the addition of ammonia produces a red color which finally becomes a brown precipitate, which dissolves to a colorless solution in potassium iodide. An aqueous solution should not give a test for chloride nor should 0.2 Gm. leave a weighable residue when ignited. (Pharm. Helvetica, edit. 4.)

1 Gm. of mercuric oxycyanide digested with 1 Gm. sodium chloride in 20 Cc. water yields a solution which should require not less than 37 Cc. of tenth normal hydrochloric acid for neutralization, methyl orange or pantothenol indicator being used.

Action and Uses.—Mercuric oxycyanide is recommended as a substitute for mercuric chloride. Its antiseptic power is said to be greater and it is claimed to be less irritating than mercuric chloride, because it does not act on albumin to the same extent. It has the advantage over the chloride that it does not corrode steel instruments.

Dosage.—It may be given by hypodermic injections in the same doses as mercuric chloride or may be applied locally in solution, 1-5000 increased as borne.

MERCURIC BENZOATE—Hydrargyri Benzoas.—Hydrargyrum benzoicum (Pharm. Française, edit. 1908), Mercuric Benzoate, $(C_6H_5COO)_2.Hg + H_2O$, is the mercuric salt of benzoic acid.

10 Gm. glacial acetic acid is diluted with 100 Cc. water and 10 Gm. yellow mercuric oxide added and the mixture agitated until solution is effected. 14 Gm. sodium benzoate is dissolved in 100 Cc. water and added to the mercury solution. The precipitate which forms is collected and washed with water till free from acid and dried at 100° C. (212° F.). (Pharm. Française, edit. 1908.)

Mercuric benzoate is a white crystalline powder, slightly soluble in water, yielding a weakly acid solution, but insoluble in alcohol or ether. At 20° C. (68° F.) a 10 per cent. solution of sodium benzoate dissolves 1 per cent. of its weight of mercuric benzoate. Heated with alcohol it is decomposed into a basic salt of a yellow color. (Pharm. Française, edit. 1908.)

A solution of 1 Gm. mercuric benzoate and 0.5 Gm. sodium chloride in 20 Cc. water yields a black precipitate with hydrogen sulphide and with ferric chloride solution it yields a fawn colored precipitate of ferric benzoate.

A solution produced by shaking 1 Gm. mercuric benzoate with 20 Cc. water should not produce more than a faint turbidity when added to silver nitrate solution, acidified with nitric acid (limit of chloride). 2 Cc. of a similar solution when mixed with ferrous sulphate solution and then concentrated sulphuric acid added so as to form a layer beneath, should produce no brown coloration at the zone of contact of the two solutions (absence of nitrates).

Action and Uses.—The same as mercuric chloride.

Dosage.—Mercuric benzoate has been recommended for hypodermic use and in gonorrhea. In urethral cases the solution may be from 1-2000 and 1-1000 with an equal quantity of sodium chloride. For hypodermic injection the following may be given: Mercury benzoate, 0.02 to 0.03 Gm.; sodium chloride, 0.01 Gm.; cocaine hydrochloride, 0.15 Gm.; distilled water, 40 Cc.

URETHAN-Hoechst.—A name applied to Aethylis Carbamas, U. S. P.

Manufactured by Farbwerke, vorm. Meister Lucius & Brüning, Höchst A.-M. (Victor Koechl & Co., New York.) Not patented or trademarked.

ARTICLES ACCEPTED FOR N. N. R. APPENDIX
Louisville Pharmacal Works, Louisville, Ky.

Elviz Duozyma—Elviz Pepsin, Diastase and Hydriastis, I. P. W. A mixture said to contain in each 100 Cc. pure scale pepsin (1:3000) 2.2 Gm. (33 grains); malt diastase 0.22 Gm. (3 1/2 grains); golden seal 0.22 Gm. (3 1/2 grains); glycerin, C. F., 10 Cc. (160 minims) and alcohol 15 per cent.

SATURDAY, JUNE 26, 1909

[The large amount of space occupied by the index this week makes it necessary to omit some departments and to curtail the space given to others.]

THE INDEX

The index to the current volume appears in this issue. To those who are familiar with THE JOURNAL it needs no introduction, but for the new subscriber, or the old subscriber who has not familiarized himself with it, the following explanation may be in order:

The index is in three parts—the "General Index," the "Index to Subjects," and the "Index to Authors." The "General Index" is a complete index to all matter that has appeared in THE JOURNAL for the past six months. Except that it is larger, it differs in no essential way from the index of any other medical publication. The "Index to Subjects," on the other hand, is an index of articles which have appeared in the most important medical journals of the world—including, of course, THE JOURNAL'S own articles. This "Index to Subjects" is practically an index medicus, not so exhaustive or complete as the *Index Medicus*, but of greater value to any one desiring to refer to the work that has been done during the past half year. In the "Index to Authors" appear the names of all authors whose articles are indexed in the "Index to Subjects."

Under the title, "The Guide to Current Medical Literature," the complete index of THE JOURNAL is reprinted in pamphlet form. Bound with it are the itemized lists of articles that have appeared in other medical journals as they were listed in THE JOURNAL each week. Its use obviates the necessity of referring to the bound volume of THE JOURNAL, and its compactness and scope make it a valuable and necessary addition to a physician's library.

PREPARE FOR THE FOURTH OF JULY

The time has come to sound again the annual warning of the approaching dangers of July Fourth, and once more to take up the task of counting the victims of our day of license and lawlessness. Year by year we see the daily press taking up the work more and more extensively, and becoming the most effective of all the allies in the fight against wanton manslaughter and

mutilation. What the Fourth of July would become without this vigorous fight by the public press is hard to imagine, for even as it is the amount of carnage and conflagration has scarcely been held stationary for the last few years. Yet there is reasonable hope of better things, for here and there vigorous individuals or organizations have come to the front, insisted on the enforcement of reasonable municipal ordinances, and by so doing have demonstrated that Fourth of July accidents can be practically abolished without any great difficulty. It is only a question of time when the suppression of lawlessness and its consequent damage to person and property will become something more than a rare, astounding spasm of civic common sense.

To tell the truth, the tardy reluctance with which we are giving up the nerve-racking noises and the deadly sports which seem inseparably connected with our idea of Independence Day testifies less to national inhumanity than to the absolute poverty of national ideas on the subject of pleasure and recreation. Rather than heartedly deprive American children of a day of pleasure, we have submitted smilingly to see them butchered to make a glorious holiday; for we have been incapable of devising any other than this crude and barbaric means of celebration. Is there another nation, ranking higher in the scale of civilization than an African tribe, which would not have devised many graceful and fitting ways of honoring the past and giving pleasure in the present, while satisfying the artistic senses through music, public pageants and other festivities? No doubt an increasing sensitiveness to the effect of the present blatant proclamation of our own rawness will join with humanitarian motives in changing and raising the character of our national holiday.

As things stand at present, however, we may look forward to having the care of some five thousand young victims of a pernicious tradition, and, according to past experience, we may save several hundreds merely by being aware of the necessity of anticipating tetanus infection. It is hardly necessary at the present time to urge thorough surgical cleansing and antitoxin prophylaxis of tetanus, for this lesson has been thoroughly learned. The number of cases of Fourth of July tetanus has been reduced from 415 in 1903 to 73 in 1907 and 76 in 1908, while at the same time the total number of accidents remained practically constant, and the deaths from causes other than tetanus actually increased from 60 in 1903 to 108 in 1908; it is evident, therefore, that tetanus has been more successfully prevented by physicians having charge of these injuries than was the case only a few years ago. Nearly all the cases of tetanus now observed are in patients who first consulted a physician too late to have proper prophylactic treatment. It may be well to call attention to the fact that the Society of American Bacteriologists has recommended that the minimum prophylactic dose of tetanus antitoxin should be 1,500 units; and a larger dose will, of course, do no harm.

Concerning the curative treatment of tetanus after it has once developed, the past year has added little that is new or hopeful. As ever, in the rapidly appearing cases with some severe symptoms, the patients usually die, while in a certain proportion of the slowly developing cases the patients recover, no matter what the treatment. Meltzer's method of inhibiting convulsions by intraspinal injections of magnesium sulphate solution has received some further trial, with several encouraging results, but it seems not to be entirely free from danger.¹ The effect of the magnesium sulphate seems to be merely to control the spasms and to give the body opportunity to excrete, destroy or neutralize the tetanus toxin. Antitoxin seems to have a distinct and real value in the treatment of tetanus, although this value is not great. The consensus of opinion seems to be that antitoxin has much greater curative effect when given intravenously, and into the spinal cord after as much cerebrospinal fluid as possible has been drawn off, than when used subcutaneously; also that it should be used unsparingly as to quantity in cases that progress unfavorably.

A PAN-AMERICAN PHARMACOPEIA?

The adoption by the Cuban government of the United States Pharmacopeia as its official standard, following so closely, as it does, the appearance of the Spanish edition of this work, "Farmacopea de los Estados Unidos de América," should be the initial step toward the admission of delegates from the Cuban government to the Pharmacopeial Convention of 1910. This suggests the possibility, if not the advisability, of similar representation, in the near future, of other Latin-American republics. While, under the present constitution of the United States Pharmacopeial Convention, representation is confined to organizations and institutions incorporated within the United States which have existed there continuously for five years immediately preceding the decennial convention, provision is made for amendments to the constitution which shall have the approval of the board of trustees of that corporation. We have no doubt that, in planning the translation of the Pharmacopeia into the Spanish language and providing for its circulation among the Spanish-speaking peoples of this hemisphere, the board of trustees had this contingency in mind, and that in due time the necessary steps will be taken thus to broaden the influence and scope of this publication. With New and Nonofficial Remedies, which contains the list of articles accepted by the Council on Pharmacy and Chemistry, already spoken of as something in the nature of a Pro-Pharmacopeia, and with English and German corresponding members of that council, perhaps the idea of an international *entente cordiale* in matters pharmacopeial is not, after all, so utopian.

1. For details of the magnesium sulphate treatment see the following articles: Meltzer and Auer: Jour. Exper. Med., Dec., 1906. Haubold, H. A., and Meltzer, S. J.: Spinal Anesthesia by Magnesium Sulphate, THE JOURNAL A. M. A., 1906, xvi, 647. Logan, Samuel: The Treatment of Tetanus by Intraspinal Injections of Magnesium Sulphate for the Control of Convulsions, THE JOURNAL A. M. A., 1906, xvi, 1502. Robinson, G. Canby: Treatment of Tetanus by Intraspinal Injections of Magnesium Sulphate, THE JOURNAL A. M. A., Aug. 10, 1907, xlix, 493. Miller: Am. Jour. Med. Sc., December, 1908.

Medical News

ILLINOIS

Hospital Dedicated.—St. Marguerite's Hospital, Peru, was dedicated with impressive ceremonies by the Bishop of Peoria, June 10.

Clinical Laboratory.—The clinical laboratory established at Paris by Dr. B. G. R. Williams has proven so successful during the last year that bacteriologic and pathologic departments are being established. The work in the laboratory is being done by the local practitioners.

Personal.—Dr. Robert J. Burns, Freeport, has been elected physician of Stephenson county.—Dr. H. R. Riddle, Mechanicsburg, has been elected physician to Sangamon county.—Dr. and Mrs. Charles G. Farnum and Dr. Alfred A. Knapp and family, Brimfield, have sailed for Europe.—Dr. Milo Eaton has assumed the duties of bacteriologist and chemist of the Peoria health department.—Dr. Martin R. Doyle has been appointed a member of the board of fire and police commissioners of East St. Louis.

Chicago

Hospital News.—A new building for the Chicago Baptist Hospital was discussed at a dinner given by the Woman's Aid Society of the institution, June 17.—The establishment within the city of a day camp for children predisposed to tuberculosis was discussed at a meeting of the board of directors of the Chicago Tuberculosis Institute, June 18. A committee was appointed to work out details of such a camp.—At the annual meeting of the Chicago-Winfield Tuberculosis Sanatorium, June 15, Dr. Theodore B. Sachs was elected a director.—The Chicago Eye, Ear, Nose and Throat College announces the completion of an annex adjacent to its present quarters, which doubles the capacity of the institution.—At the benefit concert given June 16, under the auspices of the Woman's Auxiliary of St. Mary's of Nazareth Hospital, about \$5,000 was realized to endow a bed.

Chicago Medical Society.—At the annual meeting of the Chicago Medical Society and its branches, the following officers were elected: President, Dr. John A. Robison; secretary, Dr. George F. Suker; councilors at large, Drs. George W. Webster, Merlin Z. Albro, William N. Senn, Edward A. Fischkin and Charles C. O'Byrne; alternate councilors at large, Drs. Willis O. Nance, James P. Houston, John E. Rhodes and Bernard Fantus. The North Side Branch elected Dr. Rudolph W. Holmes, president; Dr. William Hessert, vice-president; Dr. Paul F. Morf, secretary; Dr. Robert B. Preble, councilor; and Dr. Coleman G. Buford, alternate. The North Shore Branch elected Dr. Charles M. Robertson, president; Dr. Adolph C. A. Gaul, vice-president; Dr. Samuel J. McNeill, secretary; Drs. Clarence W. Leigh and Thomas A. Hogan, councilors, and Drs. Michael A. Griffin and William G. Lee, alternates. The Evanston Branch elected Dr. George W. Boot, president, Dr. William C. Danforth, vice-president; Dr. Stephen V. Bauderston, councilor, and Dr. Alice B. Brown, alternate. The Northwestern Branch elected Dr. Ralph S. Michel, president; Dr. Melchoir Whise, secretary; Dr. Charles R. Moore, councilor, and Dr. Wallace M. Burroughs, alternate. The West Side Branch elected Dr. David W. Graham, president; Dr. Benjamin H. Breakstone, vice-president; Dr. Bernard Fantus, secretary; Dr. Clarence B. King, treasurer; Dr. Cassius C. Rogers, councilor, and Dr. Andrew M. Harvey, alternate. The Aux Plaines branch elected Dr. John W. Tope, president and alternate councilor; Dr. W. Evan Baker, Chicago, vice-president; Dr. Fred W. Kettlestrings, secretary-treasurer, and Dr. Charles L. Humiston, councilor. The Douglas Park Branch elected Dr. Vanuy F. Masilko, president; Dr. John H. Edgecomb, vice-president; Dr. James G. Carr, secretary; Dr. Joseph L. Abt, councilor, and Dr. Edward E. Cunat, alternate. The Stock Yards Branch elected Dr. Samuel T. Felmlee, president; Dr. Samuel L. Fridus, vice-president; Dr. Louis J. Isaacs, secretary; Dr. Hugo E. Betz, councilor, and Dr. David R. Landau, alternate. The Englewood Branch elected Dr. Martin W. Bacon, president; Dr. Arthur C. Kleutgen, vice-president; Dr. C. Hubart Lovewell, secretary-treasurer; Dr. Carl Langer, councilor; Dr. Garrett J. Hagens, alternate, and Drs. William H. Bohart and John G. Campbell, members of Englewood council. The South Side Branch elected Dr. William Fuller, president; Dr. Otis H. Maclay, secretary; Drs. Joseph L. Miller, G. Frank Lydston, and Edwin B. Tuteur, councilors, and Drs. Edward P. Norcross, M. Milton Portis, and Jacob F. Burkholder, alternates. The South Chicago Branch elected Dr. Don S. Harvey, president; Dr. John S. Stanton, secretary; Dr. Demetrius Staneff, treasurer; Dr. Elmer E. Tansey, councilor, and Dr. John A. Anderson, alternate. The Calumet Branch

elected Dr. Charles F. Clayton, president; Dr. Raymond C. Libberton, vice-president; Dr. William H. Connor, secretary-treasurer; Dr. Jacob S. Kaufman, Blue Island, counselor, and Dr. Gerhard Seim, Blue Island, alternate.

MARYLAND

Baltimore

Faculty Election.—The faculty of Maryland Medical College has elected the following officers: President, Dr. Alexander D. McConachie; vice-president, Dr. J. William Funk; dean, Dr. Harry Gross, and assistant dean, Dr. William S. Smith.

Personal.—Dr. William H. Welch sails for Europe this month.—Dr. William S. Halsted sailed for Europe June 11.—Dr. John W. Chambers has had conferred on him the honorary degree of D.Sc., by Washington College, Chestertown.—The degree of LL.D. was conferred on Dr. Randolph Winslow by the University of Maryland, June 16, and the degree of A.M. on Dr. Samuel M. Wagaman, Hagerstown.—Dr. Harry Friedenwald was elected president of the Federation of American Zionists at its twelfth annual meeting in New York, June 16.—Drs. Lillian Welsh and Mary Sherwood sailed for Europe June 16.—Dr. Louis W. Knight was given the honorary degree of LL.D. by Loyola College, Baltimore, June 17.—Dr. Harry Friedenwald sailed for Europe June 16.—Dr. Samuel C. Chew, professor of medicine in the University of Maryland, has resigned his position, which he has held for nearly forty-five years.

Commencement Exercises.—At the thirty-third annual commencement of Johns Hopkins University, June 8, there were 50 medical graduates, and the following appointments were announced: Adam T. Bruce, fellowship in biology; William Dana Hoyt, Baltimore, University fellowship; Emma Longfellow, Machias, Maine, physiology; Francis Weld Peabody, M.D., Boston, pathology; and the following in the medical faculty: Dr. J. Morris Slemmons, associate professor of obstetrics; Dr. J. H. Mason Knox, associate in pediatrics; Charles D. Snyder, Ph.D., associate in physiology; Dr. N. E. B. Iglehart, instructor in surgery; Dr. Edward M. Singewald, instructor in neurology; Dr. G. Lane Taneyhill, Jr., instructor in neurology; Dr. Charles W. Larned, instructor in medicine; Dr. Henry Lee Smith, instructor in medicine; Dr. Samuel Wolmon, instructor in medicine; Dr. Harry S. Greenbaum, instructor in medicine; Dr. Leonard G. Rowntree, instructor in experimental therapeutics; Arthur H. Koelker, Ph.D., instructor in physiologic chemistry; Dr. Herbert M. Evans, instructor in anatomy; Dr. Milton C. Winternitz, instructor in pathology; Dr. Charles M. Byrnes, instructor in neurology; Dr. John W. Churchman, instructor in surgery; Dr. J. Staige Davis, instructor in surgery; Dr. William A. Fisher, Jr., instructor in surgery; Dr. Omar B. Pancoast, instructor in surgery; Dr. Edward H. Richardson, instructor in gynecology; Dr. Frank C. Ainley, assistant in obstetrics; Dr. Bertram M. Bernheim, assistant in surgery; Dr. Christian Dencker, assistant in neurology; Dr. Willis D. Gatch, assistant in surgery; Dr. Emil Goettsch, assistant in surgery; Dr. Eugene J. Leopold, assistant in medicine; Dr. David J. Macht, assistant in medicine; Edgar A. Slagle, Ph.D., assistant in medicine, in charge of the laboratory of the chemical division of the medical clinic; Dr. Thomas P. Sprunt, assistant in pathology; and Dr. Charles H. Stubenraugh, assistant in medicine.—The College of Physicians and Surgeons graduated a class of 46 June 2. The degrees were conferred by Dr. William P. Sprattling.

MASSACHUSETTS

Hospital Incorporated.—The Gloucester Hospital has been incorporated with a capital of \$50,000 by J. Warren Wursen and Martha J. Choate.

Graduation Exercises.—The commencement exercises of the College of Physicians and Surgeons, Boston, were held June 2, and a class of 14 was graduated. The doctorate address was delivered by Dr. Charles H. Hughes, St. Louis, on "Our Battle for Humanity and How to Fight It," and degrees were conferred by Dr. C. C. Farnham.

Alumni Elect.—At the annual dinner and meeting of Tufts Medical Alumni Association, June 8, the following officers were elected: Dr. William B. Keeler, president; Drs. Loretta J. Cummins and Caroline A. Cox, vice-presidents; Dr. Leon S. Medalia, secretary; Dr. Oliver G. Tinkham, Weymouth, assistant secretary, and Dr. H. Howard Flagg, treasurer.

Personal.—Capt. Edward A. Cunningham, Cambridge, and Lieut. Calvin B. Faunce, Boston, assistant surgeons, medical department M. V. M., have been assigned to the ambulance company section of the hospital corps.—Dr. Clement H. Halliwell has succeeded Dr. Arthur S. Hartwell, resigned, as a member of the board of health of Norwood.—Dr. Freeman A. Hall, Worcester, has been elected superintendent of the

Burbank Hospital, Fitchburg.—Dr. Harry H. Nevers has been appointed city bacteriologist and physician to the board of Health of Lawrence.

Tuberculosis.—At the annual meeting of the associated committees of the Massachusetts Society for the Prevention and Control of Tuberculosis, held at Boston, the following officers were elected: President, Dr. Arthur T. Cabot; secretary, Dr. Thomas F. Harrington; corresponding secretary, Dr. John B. Hawes, all of Boston; executive committee, Drs. Alfred Worcester, Waltham; Henry Jackson, Boston; H. Lincoln Chase, Brookline, and the chairmen and secretaries ex officio.—The trustees of the Boston Consumptive Hospital have united in a petition to the city government asking an appropriation of \$29,000 to be expended experimentally by an appointed committee in the maintenance for one year at Franklin Field of a school for 200 tubercular children.—The contract for the State Tuberculosis Sanatorium, Springfield, has been awarded to the H. C. Wood Company of Westfield, for \$56,671.

NEW YORK

Sale of Skimmed Milk Illegal.—A decision of the Court of Appeals has sustained the lower courts in overruling the demurrer of a dairy company to an action brought by the state to recover a \$5,000 penalty for selling skimmed milk. The company demurred on the ground that the statute under which the milk was sold was unconstitutional, in that it discriminated between New York and the other counties.

Personal.—Dr. Willis G. McDonald of Albany has had the honorary degree of LL.D. conferred on him by Fordham University.—Drs. M. May Allen, Nathan W. Soble and Montgomery E. Leary have been elected directors of the Rochester Public Health Association.—Dr. George W. Bates, Schenectady, who has served 43 years with the military companies of New York, Connecticut and Massachusetts, has resigned as captain and assistant surgeon of the Second Infantry, N. G. N. Y.

Consumptive Day-Camp Opened.—Last week there was opened a day-camp in Poughkeepsie, where consumptives go to obtain the benefit of rest, sunshine, fresh air and good food under proper medical supervision. Patients are also instructed in general hygiene, the nature of infection of tuberculosis, and measures to be taken to prevent its spread. The equipment of the camp consists of one nurses' tent, five 14 x 14, and eleven 9 x 9 tents, a dining room and laundry, and two bath houses. The camp was constructed and equipped at a cost of \$5,000 by the citizens of Poughkeepsie, and the management is under the direct control of the local board of health.

Must Report Tuberculosis Cases.—Dr. Eugene H. Porter, State Commissioner of Health, says he will compel physicians of the state to obey the new law which requires that all cases of tuberculosis shall be reported as soon as discovered through the local health officers. The name, age, sex, color, occupation, place where last employed and address of every person known to the physician to have tuberculosis must be reported to the local health officer within twenty-four hours after the knowledge comes to the physician. Failure to comply with this law is a misdemeanor and is punishable with a fine of from \$5 to \$50. The enforcement of this law was begun last year, but the returns have been far from satisfactory. Last year 26,230 cases were reported, and it is estimated that at least 75,000 cases exist in the state.

Buffalo

Personal.—Dr. Alfred Regan has succeeded Dr. Timothy F. Donovan as sanitary inspector of the health department. Dr. Donovan has accepted a position in Bellevue Hospital, New York City.—Dr. Edward D. Clark has been appointed surgeon of the steamer *Northwest* for the season.

Fire at State Hospital.—An overheated kiln in the drying room of laundry building of the Buffalo State Hospital set fire to the building June 16, and caused damage to the extent of about \$15,000. No injury was done the buildings of the hospital proper, and owing to the excellent discipline there was no panic among the inmates of the institution.

Academy Election.—At the annual meeting of the Buffalo Academy of Medicine, June 8, the following officers were elected: President, Dr. Earl P. Lothrop; secretary, Dr. Harry R. Trick; treasurer, Dr. Lawrence Hendee; trustee, Dr. Grover W. Wende. Section on surgery: Chairman, Dr. Thew Wright; secretary, Dr. James A. MacLeod. Section on medicine: chairman, Dr. Thomas J. Walsh; secretary, Dr. Henry P. Frost. Section on obstetrics and gynecology: Chairman, Dr. Burt C. Johnson; secretary, Dr. James F. Whitwell. Section on pathology: Chairman, Dr. Frederick J. Parmenter; secretary, Dr. Norman K. MacLeod.

New York City

Commencement.—The eleventh annual commencement exercises of Cornell University Medical College were held June 9, when a class of 61 was graduated. The address to the graduating class was delivered by Dean T. L. Crape of the university faculty.

Lease Buildings for Hospital.—The New York Neurological Institute has leased the six-story building at 149 and 151 East Sixty-seventh street, which will be fitted up for hospital purposes. The institution has the option to purchase the property at \$175,000. Among the incorporators of the institute are Drs. Joseph Collins, Pearce Bailey and Joseph Fraenkel.

More Straus Milk Depots.—Ten additional Straus milk depots have been opened in the city. They are located in parks and on recreation piers; there are now seventeen milk stations altogether. At the beginning of his work eighteen years ago Mr. Straus supplied 34,000 bottles of milk during the first year. Last year he dispensed over 34,000 bottles of milk and 1,500,000 glasses of pasteurized milk.

Personal.—Dr. John Aspell and Dr. James N. Butler have been elected directors of the Fordham College Alumni Association.—Dr. and Mrs. E. H. Porter, Dr. H. Holbrook Curtis, and Dr. and Mrs. Leigh Hunt have sailed for Europe.—Drs. Sidney A. Stein, H. Fred Lange Ziegel and David Sheitlis have been appointed adjunct visiting physicians to Beth Israel Hospital, and Dr. Eli Moschowitz has been appointed pathologist to the same institution.—Dr. Dell E. Yarnell has resigned as secretary of the Green Point Branch of the Y. M. C. A.—Dr. Robert H. Herkimer, formerly chief of the bureau of contagious diseases, Brooklyn, has been made diagnostician of the bureau.—Dr. Willard T. Graham, Brooklyn, has been appointed superintendent of the Indiana Methodist Hospital, Indianapolis.—A fire in the house of Dr. Walter B. James, June 10, did damage to the extent of about \$50,000.

NORTH CAROLINA

Physicians Found Not Guilty.—In the Superior Court, June 12, at Wadesboro, a jury brought a verdict for the defendants in a suit in which Mrs. Reddie Kiker asked damages of \$10,000 for alleged malpractice from Drs. Romulus Armfield, Marshville, and H. Moses Brooks, Olive Branch.

Commencement.—The commencement exercises of the Medical Department of the University of North Carolina were held in Chapel Hill, June 1, when a class of 12 was graduated. Dr. William H. Welch, Baltimore, delivered the doctorate address. The degree of LL.D. was conferred on Dr. Richard Henry Whitehead, the new dean of the Medical Department of the University of Virginia.

Personal.—Dr. Andrew J. Crowell, Charlotte, is reported to be seriously ill at the Charlotte Sanatorium.—Dr. Roger A. Smith, Goldsboro, sustained severe injuries in a railway accident last week.—Dr. John S. McKee, Raleigh, has been elected demonstrator of obstetrics, and Dr. J. M. Harper, Kinston, assistant in chemical pathology in the Medical Department of the State University.—Dr. Charles E. Ross has been elected attending physician of the State Institution of Deaf and Dumb at Morgantown.—Dr. S. Westray Battle, Asheville, recently returned from England.

PENNSYLVANIA

Medical Building Planned.—Architects are making plans for a School of Medicine at the University of Pittsburg to adjoin the Grant building now being completed for the university. The building is to be in the same general style of architecture, and will cost about \$200,000.

Tablet to Early Surgeon Unveiled.—With impressive exercises, a tablet to the memory of Nathaniel Bedford, the first surgeon at Fort Pitt, was unveiled June 2, in Old Trinity Church Yard, Pittsburg. Dr. Bedford located in Pittsburg in 1816, and the tablet was presented by the Pittsburg Chapter, D. A. R.

Personal.—Dr. Thomas S. Arbuthnot has been elected dean of the College of Medicine of the University of Pittsburg.—Dr. J. Calvin Wilson, Franklin, has been commissioned captain and assistant surgeon of the Sixteenth Infantry, N. G. Pa.—Dr. Briscoe has been elected resident physician of the State Hospital, Norristown.—Dr. Charles D. Schaeffer, formerly mayor of Allentown and chief surgeon of the Allentown Hospital, who has been critically ill, is reported to be improving.

Philadelphia

University of Pennsylvania Commencement.—The one hundred and fifty-third annual commencement exercises of the University of Pennsylvania were held in the Academy of Music

June 16. A class of 111 was graduated and the annual address was delivered by the dean of the college department, Josiah Penniman, who spoke on "The Best in the University Training."

Guard Hospitals Against Noise.—The Director of Public Safety has decided to have the police take every precaution this year to protect the sick and injured from the annoyances they have heretofore suffered as a result of the celebration of Fourth of July. Policemen will be placed in front of hospitals and other institutions with instructions to enforce orders that no noise is to be made within a certain distance of these institutions.

Internes Appointed.—Director Neff has appointed the following men to the resident staff of the Philadelphia General Hospital: Drs. John S. Saurman, Richard H. Lyon, Carol R. Baker, Philip F. Williams, James C. Lyons, Leon Jonas, Arthur F. Jackson, William Hartz, Samuel Largman, Hyman I. Goldstein, Robert P. Devereux, Herbert H. Thompson, Etley P. Smith, John H. Lilley, Oscar J. Klevan, Charles P. Henry, Benjamin W. Key, Louis C. Goldman and Hubert B. Gudger.—Dr. John P. MacDonald has been appointed to the resident staff of the Frankford Hospital.

Dispensary Staff Changes.—The following have resigned from the dispensary staff of the Hospital of the University of Pennsylvania: Drs. Henry D. Jump, Albert P. Francine, Clifford B. Farr, Myer Solis-Cohen, George T. Lukens, Robert S. McCombs, Howard K. Hill, Harvey E. Schock, E. C. Bender, Charles W. Fox, Daniel M. Hoyt, Linton Turner and Isaac H. Jones.—The following have been appointed to the staff: Chief consultant, Dr. Milton H. Fussell; physician in charge, Dr. Frederick H. Klaer, and assistant physicians, Drs. Edward H. Goodman, George M. Piersol and Robert Torrey.

Personal.—Dr. Charles E. de M. Sajous received the degree of LL.D. at the annual commencement of St. Joseph's College, June 15.—Drs. Henry W. Cattell, Everett P. Barnard, D. B. Shumway and Francis W. White have sailed for Europe.—Dr. George E. Price has been made assistant professor of mental and nervous diseases and Dr. J. Leslie Davis assistant demonstrator of anatomy in Jefferson Medical College.—Dr. Adolph Feldstein, a visiting physician at the Jewish Hospital for forty-four years, has resigned on account of advanced age.—Dr. Charles A. Oliver has resigned as clinical professor of ophthalmology in the Woman's Medical College of Pennsylvania.

Talks to Mothers.—The Department of Public Health is concerned in the health of infants and it has organized an alliance for the care of babies. A corps of 150 physicians has volunteered its services, committees have been organized in every ward and school houses have been obtained where lectures will be given every Wednesday, beginning June 16, for the next eight weeks. These lectures will be given under the direction of the Philadelphia Alliance for the Care of Babies, under the auspices of the Department of Public Health, the Board of Education, the Congress of Mothers, the Home and School League and allied associations. Each member of the ward committees will be supplied with a list of young mothers in their ward, and an effort will be made to interest each in the lectures. Some of the subjects to be taken up are the preparation and care of milk, the danger of flies, diet, bathing, cleanliness, the care of the eyes, sanitation and home conditions.

GENERAL NEWS AND COMMENT

Warning Concerning Unauthorized Agent.—Dr. P. L. and A. H. Hilsman of Albany, Ga., write that a man who calls himself Dr. M. Wagner of Jacksonville, Fla., pretends to represent some instrument houses. One of these, the Kny-Scheerer Company, in reply to an inquiry, stated that the alleged agent has never represented them, and that they desire assistance in locating him. Their address is 410 W. 27th street, New York City. Drs. Hilsman write that this Dr. Wagner took orders for goods and received money on account, but no goods have been sent. They describe him as a German with broken accent, about 5 feet 8 inches high, about 140 pounds in weight, and with dark hair and blonde mustache.

The Carroll Fund.—The following subscriptions have been received since the last report:

Medical Officers of the Army.....	\$ 20.00
Medical Officers of the Navy.....	15.00
Montana State Medical Association.....	25.00
Dr. F. R. Siopanskey, Helper, Utah.....	3.00
Dr. P. S. Spearman, Whiting, Iowa.....	1.00
Harris County Medical Society, Houston, Texas.....	26.75
Dr. Charles K. Winne, Jr., Albany, N. Y.....	5.00
Leyland Line, New Orleans, M. J. Sanders, Manager.....	25.00
Jefferson County Medical Society, Louisville.....	16.00
Aux Plaines Branch of the Chicago Medical Society.....	10.00

Dr. C. M. Drake, Knoxville, Tenn.....	5.00
American Investment Company, Atoka, Okla.....	5.00
American Association of Pathologists and Bacteriologists, Buffalo, N. Y.	100.00
Total	\$ 256.75
Previously reported	5,392.86
Grand total	\$5,649.61

Remittances should be sent to Major Ireland, care Surgeon-General's Office, War Department, Washington, D. C.

Civil Service Examinations.—The United States Civil Service Commission announces an examination on July 14, at various places, to secure eligibles from which to make certification to fill vacancy in pathology (male) with salary of \$2,000 per annum in the Freedman's Hospital, Washington, D. C. Microscopic technic, hematology, pathologic histology, gross pathology, and training and experience are the subjects for examination, and experience of at least one year in a pathologic laboratory and ability to make pathologic examinations and report thereon are essential.—An examination is announced for July 21, at various places in the United States to secure eligibles from which to make certification to fill vacancies as they may occur in the position of physician in the Panama Canal service. Applicants must be citizens of the United States, between 20 and 45 years of age, graduates of recognized medical schools, and must have had at least one year's experience as internes in general hospitals. Application should be made to the United States Civil Service Commission, Washington, D. C., or the secretary of the local board of examiners.

Elections.—At the twelfth annual meeting of the American Gastro-Enterological Association, held in Atlantic City, June 7 and 8, the following officers were elected: President, Dr. Julius Friedenwald, Baltimore (re-elected); vice-presidents, Drs. Walter B. Cannon, Boston, and John A. Lichty, Pittsburg, and secretary-treasurer, Dr. Charles D. Aaron, Detroit.—At the meeting of the Lackawanna Association of Railway Surgeons, held in Delaware Water Gap, Pa., May 14 and 15, the following officers were elected: President, Dr. Henry T. Dana, Cortland, N. Y.; vice-presidents, Drs. Richard T. Bang, New York City, and George M. Cady, Owego, and secretary, Dr. Jonathan M. Wainwright, Scranton, Pa.—The twenty-fourth annual Conference of the State and Provincial Boards of Health of North America was held in Washington, D. C., June 4-6, and the following officers were elected: President, Dr. Joseph Y. Porter, Jacksonville, Fla.; vice-president, Dr. Charles A. Hodgetts, Toronto, Ontario (re-elected), and secretary-treasurer, Dr. Henry M. Bracken, Minneapolis, Minn.—At the twenty-third annual meeting of the American Orthopedic Association, held in Hartford, Conn., June 15-17, the following officers were elected: President, Dr. Augustus Thorndike, Boston; vice-presidents, Drs. Albert H. Freiberg, Cincinnati, and Michael Hoke, Atlanta, Ga.; secretary, Dr. Robert B. Osgood, Boston (re-elected); treasurer, Dr. Gwilym G. Davis, Philadelphia (re-elected), and executive committee, Drs. Ansel G. Cook, Hartford, John Ridlon, Chicago (re-elected), Robert W. Lovett, Boston, Reginald H. Sayre, New York City, and Robert B. Osgood, Boston.

CANADA

Antituberculosis Societies.—Charlotte County, N. B., Association for the Prevention of Tuberculosis has been formed at Saint Stephen.—The Auxiliary Antituberculosis Society, at Victoria, B. C., held its annual election May 26.

Commencement.—At the annual commencement exercises of McGill University, Montreal, a class of 71 was graduated, and about 100 were graduated from Toronto. In the Medical Department of Toronto University, there has been a great falling off in the freshman class, due it is believed, to the recent establishment of the five-year course.

Personal.—Dr. H. McIntosh, formerly medical superintendent of the Vancouver General Hospital, is spending three months in hospitals in eastern Canada before commencing private practice in Vancouver.—Dr. McGrath, St. Johns, N. B., has been made a member of the local board of health.—The faculty of the Manitoba Medical College, on June 15, presented a gold watch, chain and locket to Dr. H. H. Chown, dean of the faculty, in recognition of his long and arduous service in behalf of the institution.

Provincial Medical Association.—The twenty-ninth annual meeting of the Ontario Medical Association was held in Toronto, June 1-3. The features of the meeting were the discussion of peritonitis, introduced by Dr. John B. Deaver, Philadelphia, and that on the pasteurization of milk, introduced by Dr. John A. Amyot, Toronto, who advocated the official pasteurization of all milk not certified; followed by Dr. Charles Sheard, Toronto, who objected to pasteurization on

the ground that dirty milk would be brought into the city; Dr. Henry T. Machell, who favored pasteurization during the summer months, and Dr. Charles J. C. Hastings, Toronto, who strongly upheld Dr. Amyot. It was decided to meet next year in Niagara Falls. The following officers were elected: President, Dr. Henry R. Casgrain, Windsor; vice-presidents, Drs. Harry B. Anderson, Toronto; John M. Rogers, Ingersoll, James C. Connell, Kingston; Joseph R. Arthur, Collingwood; secretary, Dr. Frederick A. Clarkston, Toronto; assistant secretary, Dr. G. S. Strathy, Toronto; and treasurer, Dr. J. Heurner Mullin, Hamilton.

FOREIGN

Honors for Tamassia of Padua.—Prof. A. Tamassia of the chair of medical jurisprudence at the University of Padua was recently elected member of the Italian senate, and his election and the thirtieth anniversary of his connection with the university were celebrated simultaneously May 29 by the presentation from the citizens, faculty and students of parchment testimonials, a gold medal, a bust of himself, and a banquet.

Short Vacation Course at Berck.—Calot announces a course of nine lectures, August 2 to 8, with demonstrations and practical training in orthopedics for the general practitioner and in treatment of external tuberculous lesions, affections of the bones, spine, etc. The course has been arranged partly to accommodate visiting physicians and, as the number of places is limited, application must be made in advance. Address Dr. Privat, Institut Orthopédique, Berck Plage (P. de C.) France.

Policlinic at Cairo.—An Egyptian society has been formed for the purpose of organizing hospital facilities where needed and has succeeded in interesting the government, so that a large policlinic with a connecting hospital will soon be opened at Cairo with an annual subsidy. The medical chief is Dr. Hilmi, and six services have already been organized; they are in charge of four German and two Egyptian physicians, but later Egyptian physicians will be given the preference throughout. It is hoped that the hospital will be ready to be opened in January.

Second International Congress on Industrial Accidents.—China, Japan, Greece and the various European countries except possibly, Russia and Spain, sent delegates to this congress, which convened at Rome the last week in May. The western hemisphere does not seem to have been represented. Among the points especially emphasized in the proceedings was the necessity for extremely careful examination of the injured workman at the first examination, and for shortening the interval between the accident and the awarding of the indemnity; delay fosters neuroses which otherwise would not develop or might be promptly cured, as the Germans are now learning. One of the resolutions urged the encouragement and generalization of study of the working man at his work, not only by the medical but by certain other professions. Another resolution urged that the first examination be made as complete as possible and the law's delays reduced to the minimum. Another advocated holding lectures and exhibitions in industrial centers to inform working men of the legislation and other measures affecting and protecting them, both from the legal and the hygienic points of view. The congress also expressed its approval of having special institutions in the larger industrial centers to be devoted especially to treatment of industrial accidents. Perhaps the main feature of the congress was the presentation and comparison of the different methods of handling the subject of industrial accidents in various countries. The next congress will meet at Dusseldorf, Germany.

LONDON LETTER

(From Our Regular Correspondent)

LONDON, June 5, 1909.

London School Children

The report of Dr. James Kerr, medical officer for education of the London County Council, for the twenty-one months ending, December, 1908, which has just been published, contains much of interest. It is only beginning to be realized that in providing free and compulsory education for children it is necessary for the state also to assume control over their health in order to secure as good results as possible from the enormous expenditure. Early legislation took no account of this fact whatever: it simply provided the schools and compelled parents to send their children to them. Dr. Kerr insists that to secure the best results every public provision for the care of children must be placed under the control of the education authority. This will simplify laws and avoid endless overlapping and complications. An attempt has been made to regard all that concerns the child in school as under the

control of the educational authority and all that concerns it outside the school as under the control of the local sanitary authority. This has led to a want of coordination and failure in securing the desired ends. Thus attempts to secure cleanliness of the person have been frustrated by lack of adequate means. Dr. Keri is of opinion that the only solution is to commit all provisions for aiding growth and development during school life, from the ages of 3 to 16, to the education authority, which would then administer all matters relating to feeding, teaching, cleansing, medical treatment and social protection of children.

Dental Surgery and the Public Health

At the annual meeting of the British Dental Association Mr. F. Lawson Dodd delivered an address on this subject. He said that they were to day witnessing the gradual recognition of dentistry as a branch of preventive medicine. The condition they had to face was that 86 per cent. of the poorer classes—who constitute seven-tenths of the population—are suffering from dental disease to a greater or less degree. The building up of a system of treatment of the dental disease among elementary school children was in view. The first aim would be the extension and multiplication of facilities for the care of the teeth. Not until a dental clinic was established in every center of elementary education would the dentist be doing his share in the maintenance of the welfare of the race.

Tuberculosis Exhibition at the East End

A tuberculosis exhibition, organized by the National Association for the Prevention of Tuberculosis, has been opened in Whitechapel by Mr. Burns, president of the local government board. The causes of consumption, such as dirt and the absence of light and air are illustrated by photographs of close unventilated rooms. A full-size reproduction of a single-roomed London tenement, dirty, dark and airless, in which four persons live, stands side by side with the same room, swept and garnished. There are models of unhealthy dwellings, including the now condemned back-to-back dwellings. Mr. Burns computed that 300,000 persons in England and Wales suffer from tuberculosis, but there has been great improvement. Forty years ago the death rate from the disease was 247 per 100,000; now it is only 115. However, in spite of the improvement, one out of every 11 deaths is due to tuberculosis. In Germany, he said, conditions are even worse. Of every 1,000 German workmen invalidated between the ages of 20 and 45, no fewer than 548 suffer from tuberculosis.

PARIS LETTER

(From Our Regular Correspondent)

PARIS, June 3, 1909.

The Progress of Cremation

The Society for the Encouragement of Cremation has recently held its twenty-eighth general assembly, under the presidency of M. Barrier, director of the veterinary school of Alfort and member of the Academy of Medicine. M. Georges Salomon, general secretary of the society, set forth the increase of cremation. There are at present in France cremation furnaces at Paris, at Rouen, at Marseilles and at Rheims; there will be one soon at Lyons and another at Dijon. Since cremation has been authorized, a hundred thousand bodies have been burned at Paris alone, and the number increases each year.

The society is redoubling its efforts. A committee has been instructed to ask the Minister of Public Works to have the railway charges on urns containing the ashes of the dead reduced below those on the corpses themselves, for an evident anomaly exists here. The society also asks that the municipal council of Paris install a second crematory monument at the Montparnasse cemetery, in addition to that at Pere Lachaise. The municipal council has made a grant of 1,000 francs (\$200) for an apparatus for rapid cremation; this prize has been raised to \$500 by the Society for the Encouragement of Cremation, and is to be awarded through a competitive contest.

Commission on the Abuse of Free Hospital Privileges

As I mentioned in a previous letter, a commission has been appointed to study the means of preventing the admission of well-to-do patients into the hospitals (THE JOURNAL, May 1, 1909, lii, 1437). This commission consists of six medical members, representing various professional bodies, and seven non-medical members, drawn from the administration of the public charities, one of whom is a secretary without the right to vote. It was to be expected that this mixed character of the commission would scarcely tend toward a ready under-

standing. Thus, Dr. Toussaint, delegate of the *Syndicat des médecins du département de la Seine* offered the resolution that "the hospital is exclusively reserved for paupers and the needy, and its services are gratuitous;" the medical members voted unanimously for and the non-medical members against it. M. Mesmem, director of the public charities, remarked that he opposed the resolution because it suppressed the revenues of the hospitals. As a matter of fact, the admission of paying patients brings in only about \$40,000—not a great item in a budget of \$7,000,000. At all events, the incident shows that the composition of the commission does not allow the physicians to gain their point, even on an essential point on which all are in complete agreement.

Medical Secrecy and Certificates Delivered After Death

The Court of Appeals (*Cour de Cassation*) has decided recently that Dr. Routier, head of a service at the Necker Hospital, did not violate professional secrecy in giving to the sister of a patient on whom he operated a certificate of the causes of death. The line of the argument for Dr. Routier was that the cause of death ought always to be known, if not to the public, at least to the public authorities and to the family. How could measures be taken against contagious diseases if the causes of the deaths therefrom were not known? How could mortality statistics be drawn up if the various causes of death remained secret? The physician, in such cases, is under obligation to certify the cause of death to the proper authorities; and the most elementary propriety requires that he also furnish to the family of the deceased all particulars in regard to the cause of death. It would be more than strange if such information were withheld from the grief-stricken relatives under the pretext of professional secrecy. These arguments were sustained by the court.

BERLIN LETTER

(From Our Regular Correspondent)

BERLIN, June 2, 1909.

Organization for Care of Nurlings in Bavaria

Under the title *Zentrale für Sauglingsfürsorge* in Bayern there has been founded in Munich an organization for the systematic campaign against infantile mortality in Bavaria, to act in cooperation with communities, associations and societies at present providing institutions under independent management for the care of infants. This central organization will be conducted by a working committee, consisting of university professors, pediatricians, government officials and others experienced in the care of infants. The purpose of the institution is, first, to establish general principles for development of infantile hygiene and second, to advance the local institutions by expert scientific advice and financial assistance. The organization is also to assist the government in the improvement of infantile hygiene by its advice; it receives from the state treasury an appropriation to cover the expense of management.

A German Motherhood Society

An important means for the campaign against infantile mortality is care for the puerperal period among working women, so that they may be in a position to nourish and care for the infant at its most dangerous period, i. e., in the first weeks of life. For this reason the Reichstag has made the provisions which I have noted in a previous letter. The bill for imperial insurance regulation also treats this question and provides for further care for lying-in women. These provisions, however, are insufficient to insure the proper care of new-born children by working women. For this reason efforts of late have been increasing to insure lying-in women the means of sparing themselves a long enough time after delivery and of providing themselves sufficient nourishment, so that they may themselves nurse their infants, as far as possible or at least devote themselves sufficiently to their care. The first motherhood society, which is to be regarded as a forerunner of a general motherhood insurance, was founded a short time ago at Karlsruhe. The functions of the society consist in the provision of money for lying-in women and nursing premiums. At the same time the office serves the purpose of instruction and explanation. The member has a claim on the society only when she has belonged to it at least one year. Only residents of Karlsruhe or persons employed there whose private or family income for the last year did not exceed the sum of \$750 (3,000 marks) are entitled to membership. Members who leave Karlsruhe but still reside in Germany are entitled to a claim on the society only until the next demand. As money for childbed after a membership for one year \$5 (20 marks), after two years \$7 50, after three years \$10 are paid, half of which is given on notice of delivery

and one-fourth after the lapse of one and two weeks each. Under special circumstances the management may pay the whole sum at one time. In case of twins the sum is raised \$2.50 (10 marks). Mothers belonging to the society who suckle their children for six weeks after delivery receive a nursing premium of 75 cents (3 marks), and those who continue to nurse their children three months after delivery receive a further premium of 75 cents. Every member pays as monthly dues 12 cents (50 pfennig). Some officials and sick benefit associations have already placed considerable sums at the disposal of the new society.

Traveling Tuberculosis Exhibitions

In its efforts against tuberculosis the German central committee has recently availed itself of the so-called traveling tuberculosis museums, that is, a collection of exhibition material illustrating the origin, spread, and control of tuberculosis. These exhibitions can be sent to various places and are used in connection with popular lectures arranged by the central committee or in other ways. Such traveling tuberculosis museums have been established in Karlsruhe, Darmstadt and Hannover, and have been sent to various places and inspected by the populace with great interest. The traveling museum of the German central committee consists of the following parts:

1. Illustrating the structure of the human body: Six anatomical plates of the thorax, lungs and the breathing, two models of the thoracic organs.

2. Illustrating the nature and origin of tuberculosis: Figures showing expectoration from the lungs containing tubercle bacilli, thirty kinds of dust from various workshops, a schematic illustration of the entrance of tubercle bacilli into a pulmonary vesicle, also showing the origin of tuberculosis in the mouth, throat and ear.

3. Illustrating the development and course of tuberculosis: Schematic illustration of the various stages of consumption, pathologic preparations of human and animal tuberculosis, Röntgen pictures of various stages of pulmonary tuberculosis, pictures illustrating lupus and tuberculosis of the skin.

4. Illustrating the spread of tuberculosis: Tables showing the total mortality and the mortality from tuberculosis in the German Empire, Prussia, England, Scotland and Ireland.

5. Illustrating the prevention of tuberculosis: Models and figures showing the care of the teeth, tables showing the nutritive value of the most common articles of food, statistics on the connection between tuberculosis and alcoholism. Illustration of the hygiene of dwellings, method of preventing the distribution of sputum (sputum cloths, sputum bottles, sputum cups, and apparatus for disinfection).

6. Illustrating the treatment and cure of tuberculosis: Pictures of popular sanatoria, reclining chairs, tables illustrating the extent and success of invalid insurance in the treatment of tuberculosis and the exhibition of the German institutions for tuberculosis.

New Diagnosis of Insanity

The latest development of serum methods of diagnosis appears to be that of Dr. Much and Dr. Holzmann of the Hamburg Eppendorf Hospital, who publish a reaction in No. 20 of the *Münchener medizinische Wochenschrift* which is claimed to be typical for certain forms of mental disease. They claim that in manic depressive insanity and dementia præcox, substances are found in the blood which are absent in other diseases and in healthy individuals. The method is as follows: Washed human blood corpuscles are dissolved by cobra venom poison. If cobra venom is added to normal human serum the solution of the blood corpuscles proceeds unhindered. On the other hand, it is said that an inhibition occurs on the addition of serum taken from patients with the two above named diseases. The reaction is said to occur in the blood of persons who at the time show no signs of circular insanity, but who belong to families in which this form of mental disease prevails. The authors have tried their method with satisfactory results in 400 cases.

VIENNA LETTER

(From Our Regular Correspondent)

VIENNA, June 1, 1909.

The Fight Against Trachoma in Austria

Since the infectious nature of trachoma has been recognized, several attempts have been made to suppress or to minimize the epidemics, which in this country have been of daily occurrence. There are three parts of the empire in which the disease has had a firm hold on the population: Hungary, Galicia and Bukovina. Reliable statistics are obtainable only from military sources in regard to the conditions in the past. Thus in 1835 a certain regiment recruiting from the south-

eastern districts of Hungary, had 74 per cent. of its men affected by trachoma. One consideration must be given to the possibility of an incorrect diagnosis, as the diagnostic means at present at our disposal perhaps allow of a more sure recognition of the disease; but still the prevalence of trachoma in former days was so manifest that it was called "Hungarian" or "Galician ophthalmia," while now it is known here only as "Egyptian ophthalmia." Even thirty years ago, 0.2 to 1. per cent. of the entire population was suffering from the symptoms of trachoma. Since then, much has been done to eradicate it. Thus at present no more than 2 or 3 per cent. of the soldiers suffer from trachoma, especially in the regiments from the affected districts. The maximum was 23 per cent. in a regiment, while the majority of the soldiers are free from it. There are among 162 regiments with 350,000 men no more than 18 regiments affected, with 706 cases last year. This is really a marked improvement if it be compared with the fact that in Galicia there were in this year 5,980 persons who applied to the hospitals for relief from trachoma, or 38 per cent. of all eye patients. The navy of this country is nearly exempt from trachoma. In 1890 there were 0.9 per thousand and only of the entire navy affected, while in the report for 1908 only two cases were noted. The means by which the relative freedom of the majority of regiments from all infection is attained is by rigid exclusion of all suspected cases by invalidation into hospitals of all soldiers acquiring the disease and by strict supervision with adequate instructions of regiments stationed in infected or suspected regions. It may be noted, in parenthesis, that while even twenty years ago, our famous ophthalmologists were wont to make a correct guess-diagnosis of trachoma by being told whence the patient came, at present they must be very careful not to misinterpret the fact. Therefore, one does not see approximately as many operations for disfigurement of the eyelids in the eye clinics as was the rule a quarter of a century ago. On the other hand, the eye clinics are a favorite place for the military surgeons, who are sent there by the ministry of war to complete their knowledge in this so important branch of medicine. American physicians will appreciate the work done in this line, if they consider what rigid measures are taken by the American government to prevent the immigration of Russian aliens affected with trachoma, and if they remember that the population of Russia intermingles freely with the Hungarian and Galician population, being united to it partly by the bonds of creed, partly by nationality.

Depopulation of the City

In the distribution of the population, as shown by the report of the board of health, a remarkable change has been noticed within about fifteen years, causing a sure depopulation of the central parts of Vienna, while the peripheral parts, or rather suburbs, have increased in density of population to such a degree that they in their turn will soon be fit for depopulation. The increased facilities for communication, caused by changing the entire system of horse into electric traction cars, the growing wealth and the recognition of the value of pure air for health have prompted many a city dweller to live out of town not only during summer, as is here the custom, but all the year round. Now an unexpected fact has been reported; the city of Vienna is the healthiest spot in Austria. This paradox is explicable only by the assumption that the low density of population there, together with the absence of so many infectious children and adults, have a very satisfactory influence on those who remain there. Whilst the mortality of Vienna is 16.7 per thousand, in the city itself it is only 12.5 per thousand and the morbidity is also low as the diseases of infancy figure only in a small proportion. The increasing population of the outskirts has prompted the erection of many smaller hospitals in these districts, whilst the central hospitals are doomed, for in a year or two, the old General Hospital, well-known to all students, will be pulled down to be rebuilt out of town, in healthy grounds.

Prohibition of the Sale of the "Energos" Fraud

By the ordinance of the Minister of the Interior, the electrical apparatus called "Energos" said, by its manufacturers, to possess healing properties for all nervous disorders, impotency, failing strength, etc., has been struck off the list of salable articles. The wide-spread advertising of this instrument of fraud has also been put under control, and care has been taken that the importation of the various parts of the apparatus be also prevented. What the reason of this sudden energetic action may be is not known; perhaps the repeated petitions by medical corporations have effected the issue of this ordinance. At any rate, it is satisfactory to note that slowly the government comes to understand its duties in regard to the protection of the public in this respect.

Pharmacology

SUCCUS ALTERANS

Report of the Council on Pharmacy and Chemistry

The following report was adopted by the Council:

It is believed that unwarranted and exaggerated therapeutic claims are made for Succus Alterans by its manufacturers, Eli Lilly & Co., Indianapolis. In view of the disastrous results which may follow, if, from the statements made, physicians should be led to rely on the product as a treatment for syphilis, it is recommended that Succus Alterans be refused recognition and that this fact be published with comments.

W. A. PUCKNER, Secretary.

COMMENT: Succus alterans is a preparation which has been put on the market for some years by Eli Lilly & Co., as a remedy for syphilis. The serious character of this disease and especially the deplorable results that ensue from its improper or insufficient treatment, should make a firm hesitate to advise any treatment for it which experience has not demonstrated to be at least as efficacious as that which is generally accepted and well proved. Succus alterans is the result of a combination of circumstances; no one person is responsible for it. It was probably the natural desire for a remedy free from the occasional injurious results of mercury that led Dr. J. Marion Sims to advocate the use of a collection of indigenous American plant drugs, sarsaparilla, stillingia, xanthoxylum, etc., which had a local reputation for the cure of syphilis. These drugs are supposed to be inert when the dried plants were used, and this gave an opportunity for the development of a nostrum. The ingredients are well known, but as their virtues are supposed to be lost in drying, the physician can not have his druggist compound them, but must, perforce, prescribe the proprietary combination.

Those who consented to experiment with the new remedy soon found that the claims to curative properties were unfounded, but the strong commercial interests backing it have prolonged its life to the present time. Authorities on syphilis either say nothing about the preparation or mention it merely to condemn; but the proprietors of the nostrum continue to assert that it is not only practically a specific in syphilis, but now recommend it for various derangements of the blood and all sorts of skin diseases.

This being the case, what shall the wise physician do? Shall he blindly follow an authority of a past generation or shall he recognize that the claims of an interested manufacturer ought not to weigh against the consensus of his present-day confrères who have given the treatment of syphilis their special attention? The exploitation of such a preparation is deserving of strong censure. By such methods the firm places itself on the same plane as those nostrum venders, who advertise certain antiseptic sprays and gargles as cures for epidemic meningitis and diphtheria and thereby deprive credulous victims of the curative antitoxin treatment. Succus alterans is not a new remedy on trial for its possibilities of improvement in therapeutics; it is an old mixture which has been tried and found wanting.

The Physician and Nostrums

Dr. William C. Herman, Cincinnati, in a paper with the above caption read before the Cincinnati Academy of Medicine,¹ handled nostrums, both of the "patent medicine" and "ethical proprietary" types, without gloves. Dr. Herman has had some years' experience as a pharmacist, and is able to look at the nostrum evil from the viewpoint of both physician and druggist. After defining the term and showing the difference between the true "patent medicine" nostrum—somewhat of a raity—and the proprietary nostrum, Herman refers to the nostrum proprietor and asks: "Who is he and what are his qualifications? He frequently is a doctor who has not been successful in his practice, a drug clerk who notes how easy the money came for the other fellow, for, as Colonel Sellers said years ago, 'there's millions in it.' He may be an advertising agent, a lawyer or a combination of the above. . . . What are his qualifications? He must have a maximum of gall, a

minimum of conscience, a genius at writing deceptive advertisements . . . and many doctors to prescribe and advertise his nostrums."

Referring to that large class of remedies which, while never advertised direct to the laity, are, nevertheless, used and purchased by the general public because physicians prescribe them in "original packages," he says: "The general public never hear of them through the public press. All their publicity is secured through the medical press, by means of the manufacturer's literature, sometimes gotten out in the shape of a medical journal and through samples to doctors. For one physician capable of prescribing the precise medicinal agents needed by each individual patient, there are at least five who prescribe these proprietaries."

The laws of various states make it legally impossible for a layman to purchase certain poisonous and habit-forming drugs except on a physician's prescription; the nostrum trade, however, leaves a loophole for those who want these drugs. Says Dr. Herman: "You can not buy codein from the average druggist, but he will sell you an ounce box of antikamnia and codein tablets or antikamnia and heroin if you prefer. Neither can you buy chloral, but you can buy somnos and bromidia by the pint if you have plenty of money. . . . From one party who bought a pint bottle of somnos every week, I inquired how he became acquainted with it; he promptly answered, his doctor prescribed a small bottle, but it was too expensive that way, so he buys it by the pint now and he gets the original bottle."

Dr. Herman suggests that physicians study the U. S. Pharmacopeia and the National Formulary and "get acquainted with some real medicine and give up this canned or ready-to-wear medicine."

Correspondence

University Theses in the Library of the College of Physicians

To the Editor:—I notice that on page 1932 of your issue of June 12, certain desiderata in British libraries are mentioned and in connection with this the statement is made that in many, if not all of our American libraries, complete sets of university dissertations and degree theses are wanting.

I beg to say that so far as the library of the College of Physicians is concerned, we have a complete series of the "Thèses de Paris" from 1880 up to the present time, and that we receive all the dissertations from twenty-eight European universities and one South American presented for degrees.

Our library is perhaps richer than any other in this country (with the exception, of course, of the Surgeon-General's in Washington) in such theses, and in complete files of many of not only our ordinary, but rarer medical journals, of which we take over 600.

I would not have troubled you with this note but for the fact that the members of the profession at large, I am sure, are not aware of the extraordinary character and value of the library of the College of Physicians, one of the first rank in the world.

W. W. KEEN, Philadelphia.

A Disclaimer Concerning Proprietaries

To the Editor:—My attention has been called to the fact that a concern known as the "A. M. C." is advertising a number of preparations said to possess medicinal properties, one of which is called "Expectorant (Hare)"; another, "Tonic Comp. (Hare)." I am also told that traveling salesmen employed by this concern are representing that I am responsible for these formulas and that I have a financial interest in them. Please state for the benefit of your readers and for my protection that such a use of my name is without any justification whatever. I never heard of the "A. M. C.," whatever that may mean, before to-day, nor do I know what its compounds contain. It is hardly necessary for me to add that all statements made by any one to the effect that I have any interest in any pharmaceutical or chemical preparation are absolutely untrue.

H. A. HARE, Philadelphia.

1. Kentucky Med. Jour., May 1. 1909.

The Public Service

Navy Changes

Changes in the Medical Corps, U. S. Navy, for the week ended June 19, 1909.

Russell, A. C. II., medical inspector, transferred to the retired list from June 30, 1909.

Wieber, F. W. F., surgeon, detached from command of the Naval Hospital, Canacao, P. I., and ordered home to wait orders, with three months' delay en route.

Hathaway, G. S., P. A. surgeon, ordered to the Navy Yard, Mare Island, Cal.

Irvine, W. L., acting asst.-surgeon, commissioned acting assistant surgeon, with rank of Lieutenant, junior grade, from June 9, 1909.

Stitt, E. R., surgeon, detached from the Naval Medical School, Washington, D. C., and ordered to command the Naval Hospital, Canacao, P. I.

Minter, J. M., asst.-surgeon, discharged from treatment at the Naval Medical School Hospital, Washington, D. C., and granted sick leave for one month.

Army Changes

Memorandum of changes of stations and duties of medical officers, U. S. Army, week ended June 19, 1909.

Pillsbury, H. C., 1st lieutenant, granted leave of absence for 2 months when relieved from duty in the Philippines Division.

Jones, H. W., 1st lieutenant, ordered to Washington, D. C., for temporary duty at the Walter Reed Army General Hospital.

Van Poole, G. N., capt., relieved from duty at Fort Slocum, N. Y.; will proceed at the expiration of his present leave of absence to Fort Sheridan, Ill., for duty.

Banister, W. B., major, ordered from San Francisco to Fort Snelling, Minn., for duty as surgeon and as acting chief surgeon, Department of Dakota.

Bispham, W. N., major, granted leave of absence for 14 days.

Reynolds, F. P., major, relieved from duty at Fort Snelling, Minn.; will proceed to Fort Monroe, Va., for duty.

Snyder, C. R., capt., granted leave of absence for 15 days.

McAndrew, P. H., capt., leave extended 10 days.

Johnson, R. W., major, retired from active service June 16, 1909.

Truby, A. E., major, ordered to command field hospital at camp near San Francisco.

Fauntleroy, P. C., major, ordered to command field hospital at camp, Sparta, Wis.

Reynolds, F. P., major, ordered to command field hospital at camp, Antietam, Md.

McLellan, G. H. M. R. C., ordered from Fort Crook, Neb., to Fort Omaha, for temporary duty.

Austin, T. C. M. R. C., ordered to active duty; will proceed to Jackson Barracks, La., for duty.

Conzelmann, F. J., M. R. C., granted leave of absence for 10 days.

Snow, C. G., M. R. C., ordered to duty with troops en route and at Sparta, Wis.

Miner, Donald, M. R. C., honorably discharged from the service of the United States, his services being no longer required.

Public Health and Marine-Hospital Service

List of changes of stations and duties of commissioned and other officers of the Public Health and Marine-Hospital Service for the seven days ended June 16, 1909:

Eager, J. M., asst. surgeon-general, relieved from duty at the bureau in charge of the division of sanitary reports and statistics, to take effect June 23, 1909, and directed to proceed to Portland, Me., and assume command of the Portland Quarantine Station.

Stoner, George W., surgeon, reassigned to duty as chief medical officer at Ellis Island, N. Y., to date from March 8, 1909.

Kalloch, P. C., surgeon, on arrival of Surgeon J. M. Eager, relieved from command of the Portland, Me., Quarantine Station.

Brooks, S. D., surgeon, granted 1 month's leave of absence from July 1, 1909.

McIntosh, W. P., surgeon, detailed as member of board of medical officers convened under bureau order of June 3, 1909.

Geddings, H. D., surgeon, detailed to attend the meeting of the International Commission for the revision of the international classification of diseases and causes of death to be held in Paris, France, July 1-3, 1909.

Young, G. B., surgeon, reassigned to duty in command of the Marine Hospital at Chicago, to date from March 24, 1909.

Rosenau, M. J., surgeon, granted 1 month's leave of absence from June 8, 1909, on account of sickness.

Clark, Taliaferro, P. A. surgeon, granted 7 days' leave of absence from June 11, 1909, under paragraph 191, Service Regulations.

McMullen, John, P. A. surgeon, relieved as member of board of medical officers convened under bureau order of June 5, 1909.

Moore, Dunlop, P. A. surgeon, leave granted May 1, 1909, for 3 months from June 3, 1909, amended to read 3 months from June 3, 1909, on account of sickness.

Goldberger, Joseph, P. A. surgeon, directed to proceed to Philadelphia, on special temporary duty.

Trask, J. W., P. A. surgeon, detailed as asst. surgeon-general in charge of the division of sanitary reports and statistics, to take effect June 24, 1909.

Campbell, P. M., acting asst.-surgeon, granted 30 days' leave of absence from June 10, 1909.

Hunter, S. B., acting asst.-surgeon, leave granted May 19, 1909, for 4 days from May 18, 1909, amended to read 14 days from May 18, 1909.

Lawhorn, C. C., acting asst.-surgeon, granted 15 days' leave of absence from June 11, 1909.

Lowthian, Elvin, acting asst.-surgeon, granted 3 days' leave of absence from June 9, 1909, under paragraph 210, Service Regulations.

Miranda, R. U. L., acting asst.-surgeon, leave granted May 15, 1909, for 4 months from June 1, 1909, amended to read 4 months from June 8, 1909.

Porter, Joseph Y., Jr., acting asst.-surgeon, granted 30 days' leave of absence from July 1, 1909.

Rea, Robert H., acting asst.-surgeon, granted 2 days' leave of absence from June 16, 1909.

Rodman, John C., acting asst.-surgeon, leave granted June 3, 1909, for 7 days from June 8, 1909, revoked.

Schwartz, Louis, acting asst.-surgeon, granted 28 days' leave of absence from July 12, 1909.

Stoddard, C. S., acting asst.-surgeon, granted 30 days' leave of absence from June 15, 1909.

Health Reports

The following cases of smallpox, yellow fever, cholera and plague have been reported to the Surgeon-General, Public-Health and Marine-Hospital Service, during the week ended June 18, 1909:

SMALLPOX—UNITED STATES

California: Sacramento, May 22-29, 1 case.
Delaware: Millboro, May 6-June 10, 2 cases.
Florida: Pensacola, May 1-31, 1 death.
Georgia: Macon, May 31-June 6, 3 cases.
Indiana: Fort Wayne, May 28-June 5, 8 cases; South Bend, 1 case.
Kansas: Kansas City, May 28-June 5, 6 cases.
Kentucky: Lexington, May 29-June 5, 1 case; Newport, May 30-June 6, 1 case; Paducah, May 23-30, 1 case.
Louisiana: Hammond, May 15-June 5, 1 case.
Michigan: Grand Rapids, May 29-June 5, 1 case.
Minnesota: Duluth, May 28-June 4, 2 cases.
Missouri: Kansas City, May 28-June 4, 1 case.
Montana: Butte, May 26-June 3, 7 cases.
New Jersey: Hoboken, May 28-June 5, 1 case.
Pennsylvania: Bullis Mills, April 29-June 14, 9 cases; Harmony, May 13-June 14, 1 case.
Ohio: Cincinnati, May 27-June 4, 5 cases; Geneva, April 20-June 10, 7 cases; Plain City, March 1-June 10, 74 cases.
Texas: San Antonio, May 28-June 5, 11 cases.
Virginia: Richmond, May 28-June 5, 5 cases.
Washington: Tacoma, May 23-30, 3 cases; Walla Walla, May 28-June 5, 1 case.
West Virginia: Wheeling, May 28-June 5, 2 cases.
Wisconsin: La Crosse, May 28-June 5, 1 case; Marinette, May 22-29, 1 case; Milwaukee, 1 case.

SMALLPOX—FOREIGN

Canada: Halifax, May 24-31, 2 cases; Winnipeg, May 22-29, 2 cases.
Ceylon: Colombo, April 17-24, 3 cases.
China: Canton, April 17-May 1, 10 cases.
France: Paris, Jan. 16-23, 4 cases received; Feb. 20-27, 3 cases; (out of date); May 8-22, 4 cases.
Germany: Hamburg, May 16-23, 2 cases, Russian emigrants.
Great Britain: Bristol, May 15-22, 2 cases, 2 deaths.
India: Bombay, May 4-11, 24 deaths; Calcutta, April 24-May 1, 100 cases; Madras, May 1-7, 4 deaths; Rangoon, April 24-May 1, 8 deaths.
Indo-China: Saigon, April 10-May 1, 10 cases, 4 deaths.
Italy: May 16-23, 10 cases, 4 deaths; Turin, May 14-21, 1 case.
Java: Batavia, April 24-May 1, 4 cases.
Mexico: Guadalajara, May 20-27, 3 deaths; Mexico, April 17-May 8, 66 deaths; Monterey, May 23-30, 5 deaths.
Persia: Astrabad, April 13-24, epidemic.
Portugal: Lisbon, May 15-29, 12 cases.
Russia: Moscow, May 8-15, 20 cases, 6 deaths; Riga, May 15-29, 18 cases; St. Petersburg, April 24-May 8, 28 cases, 13 deaths; Warsaw, March 29-April 3, 5 deaths.
Serbia: Belgrade, May 8-15, 4 cases, 4 deaths.
Spain: Barcelona, May 17-24, 6 deaths; Valencia, May 8-15, 10 cases, 1 death.
Switzerland: Geneva, May 8-15, 2 cases.
Turkey: Constantinople, May 8-16, 2 cases; Smyrna, April 20-May 6, 1 case.
Uruguay: Montevideo, March 1-31, 8 cases.

YELLOW FEVER

Barbados: May 15-29, 3 cases.
Brazil: Manaus, May 8-15, 9 cases, 4 deaths; Para, May 8-22, 10 cases, 10 deaths.
Mexico: Merida, May 30-June 2, 2 cases.
Portugal: Lisbon, June 1-14, 2 cases, in quarantine, from steamship *Langfanc* from Para.
Venezuela: Maiquetia, May 24, 1 case, 1 death.

CHOLERA

India: Bombay, May 4-11, 10 deaths; Calcutta, April 24-May 1, 105 cases; Rangoon, 7 deaths.
Russia: St. Petersburg, May 20-27, 4 cases.

PLAGUE

Chile: Antofagasta, May 1, 5 cases; Arica, May 13, present; Iquique, May 8, 20 cases, 14 deaths.
China: Amoy, May 5, present; Am Phan, April 24-May 1, 5 cases, 3 deaths; Canton, April 17-May 1, 80 cases, 55 deaths.
India: Bombay, May 4-11, 313 deaths; Calcutta, April 24-May 1, 127 deaths; Rangoon, 18 deaths.
Indo-China: Saigon, April 10-May 1, 9 cases, 9 deaths.
Peru: April 24-May 8, 57 cases, 32 deaths.
Venezuela: Caracas, June 3-9, 2 cases.

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS will not be noticed. Queries for this column must be accompanied by the writer's name and address, but the request of the writer not to publish name or address will be faithfully observed.

SUPPRESSED OR DELAYED ERUPTION IN MEASLES

To the Editor:—Please publish a list of the best remedies to use in measles to bring out the eruption when it is suppressed or delayed. H. W. H., Kansas.

ANSWER.—There is probably no drug that will "bring out" the eruption in measles, and the administration of a drug for this purpose might obscure the symptoms by causing an eruption of its own. A simple warm bath undoubtedly hastens the appearance of the characteristic exanthem in measles. When the eruption is distinctly delayed or retrocedes, the brief use of the hot pack may be useful; this may be applied to the chest and abdomen and especially to the extremities. From the onset of the disease care should be taken to keep the skin active by warmth and bathing.

"QUININ INHALATIONS IN PERTUSSIS"

To the Editor:—In an article by Dr. H. C. Masland in THE JOURNAL, June 5, 1909, page 1832, a formula is given, the two notations of which do not seem to correspond. Kindly state which of the two is correct. H. M. L., Brooklyn.

ANSWER.—In fairness to Dr. Masland, it should be stated that the error was not his; in the manuscript the metric notation only was given, the apothecary's notation being added in THE JOURNAL office. Dr. Masland informs us, however, that the amount of liquid petrolatum, given by him originally as 25 c.c., should be 20 c.c. The corrected prescription, therefore, should read:

R	gm. or c.c.
Potassium hydroxide	29½
Alcohol q. s. ad.....	200
Add 5 c.c. of the above to	
Liquid petrolatum	20
Oleic acid	10

CLEANLINESS IN REFRIGERATORS—KEEPING MILK COVERED

To the Editor:—1. Please explain the nature of the jelly-like substance that collects in the refrigerator pipes which carry off the water from melting ice.

2. Is it essential to keep milk in bottles sealed with paper caps while in the refrigerator? C. A. DEXTER, Columbus, Ga.

ANSWER.—1. The substance referred to consists of the impurities in the ice increased in bulk somewhat by the growth of fungi which may take place even at the low temperature of the ice-box.

2. Milk should be kept sealed. Although micro-organisms grow very slowly in it at the temperature of the refrigerator, such a growth does take place, and it is very desirable to prevent the entrance of outside germs as far as possible.

SANFELICE'S CANCER SERUM

To the Editor:—Please give any information concerning the serum of Prof. Sanfelice for cancer, which I find mentioned in brief in a pharmaceutical journal. J. L. McALLISTER, Beaver, O.

ANSWER.—Sanfelice asserts, as a result of investigations extending over a number of years, that the cause of cancer is a micro-organism which belongs to the pathogenic saccharomycetes. These organisms when inoculated by themselves will only occasionally, but more frequently than the cells, give rise to malignant tumors. These results of Sanfelice are said to have been confirmed by Leopold and by Plimmer. Sanfelice found that malignant growths could be reproduced by cells that did not contain the organisms, but only their toxins. By inoculating the toxin in an attenuated form into a series of dogs he was able to obtain an antitoxic serum which caused the degeneration of cells of tumors produced by inoculation of malignant tumors or their toxin. He then proceeded to try the serum on dogs affected with spontaneous tumors. Eleven animals having malignant tumors in various parts of the body were inoculated and all recovered. This success encouraged him to try the effect of the serum on men. Three cases gave very encouraging results. By the disaster at Messina his collections of serums and animals undergoing treatment or cured were destroyed. He is beginning to reconstruct what he has lost and to continue the work from which he hopes to obtain such desirable results. The following articles may be referred to:

Sanfelice, F.: Inoculability of Malignant Tumors, *Riforma medica*, 1904, xx, No. 36; abstr. in JOUR. A. M. A., No. 26, 1904, 1669.

Sanfelice, F.: Azione dei prodotti solubili dei blastomiceti in rapporto alla etiologia dei tumori maligni, *Riforma medica*, 1906, xxii, No. 28.

Piccinini, M. G.: Report of a lecture given by Prof. Sanfelice, May 13, 1909, at Bologna: La natura e la terapia del cancro, *Politico*, 1909, xvi, No. 21, p. 659.

Marriages

JOHN HENRY GRAHAM, M.D., to Miss Alice Kathryn Nickel, both of Butte, Mont., June 8.

GORDON WILSON, M.D., Baltimore, to Miss Elizabeth Preston Elliott, at Baltimore, June 5.

HARRY MELVILLE HALL, M.D., to Miss Jane S. Wheat, both of Wheeling, W. Va., May 20.

HENRY CULP EARNSHAW, M.D., to Miss Rachel B. Tatnall, both of Bryn Mawr, Pa., June 12.

F. H. CREAMER, M.D., Le Beau, S. D., to Miss Katherine Hobson of Des Moines, Iowa, June 2.

ALBERT G. WEBSTER, M.D., Dunleith, W. Va., to Miss Lillian M. Schoenborn at Baltimore, in March.

WILLIAM M. STOCKWELL, M.D., to Miss Clara S. Phelps, both of Suffield, Conn., at Hartford, June 8.

CHARLES H. McMILLAN, M.D., Bobbin, Texas, to Miss Helen Isabell Matthews, at St. Louis, May 5.

T. K. WORTHINGTON, JR., M.D., Philadelphia, to Miss Mary Worsdale Spencer, at Baltimore, June 7.

EDWARD HENRY HERBERT OLD, M.D., U. S. Navy, to Miss Anne Eugenia Smith of Pittsburg, June 2.

ZENO BROWN, M.D., Greenville, N. C., to Miss Nannie Lou Waldrop of Hendersonville, N. C., June 16.

FREDERICK D. McALLISTER, M.D., to Miss Gladys Anna Schreiber, both of Lawrence, Mass., June 8.

CHARLES EASTMOND, M.D., Brooklyn, N. Y., to Miss Bonnie Belle Dorland of Arlington, N. J., June 16.

WILLIAM RICHARD DEAR, M.D., M.R.C., U. S. Army, to Miss Greeta Marian Tibbitts of Washington, June 2.

WILLIAM D. HILLIARD, M.D., Asheville, N. C., to Mrs. H. M. Colby of New York City, at Charlotte, N. C., June 3.

THOMAS LEE MCCARRIER, M.D., Baltimore, to Miss Myrtle Edna Bream of Gettysburg, Pa., at Baltimore, June 5.

Deaths

Scott Lafavra Rountree, M.D. University of Pennsylvania, Philadelphia, 1860; a member of the Medical Association of the State of Alabama; a surgeon of Hardee's Brigade and later of the Ninth Tennessee Cavalry and Eighth Alabama Cavalry in the Confederate service during the Civil War; a charter member and for ten years president of the Morgan County Medical Society; for eighteen years health officer of Morgan county; and founder of Hartsells, Ala., died at his home, June 8, aged 71.

Robert K. Tuthill, M.D. New York Medical College, New York City, 1859; a member of the American Medical Association; consulting surgeon to Vassar Brothers' Hospital, Poughkeepsie; surgeon of U. S. Volunteers during the Civil War; assistant surgeon of the Twentieth New York Volunteer Infantry and later surgeon in chief of the First Division, Twelfth Army Corps Volunteer Infantry during the Civil War; at one time president of the Medical Society of Dutchess county; died at his home in Poughkeepsie, June 9, from pneumonia, aged 73.

John Fletcher Reger (thirty-five years of practice, W. Va.); U. S. Pension Examining Surgeon; a member of the staff of Reynold's Memorial Hospital, Moundsville, W. Va.; a member of the National Association of Railway Surgeons; American Academy of Railway Surgeons, and Baltimore and Ohio Association of Railway Surgeons; local surgeon of the Baltimore and Ohio Railroad; died at his home in Littleton, W. Va., May 10, from neurasthenia, aged 72.

Joseph Spiegelhalter, M.D. Humboldt Medical College, St. Louis, 1862; a member of the American Medical Association, American Association for the Advancement of Science, and American Public Health Association; a veteran of the Civil War; health officer of St. Louis in 1865; coroner of St. Louis county, from 1866 to 1870; a member of the board of health of St. Louis from 1876 to 1887; died at his home in that city, June 7, aged 74.

Walter Franklin Fundenberg, M.D. University of Maryland, Baltimore, 1850; surgeon of the One Hundred and Thirty-sixth and One Hundred and Seventy-sixth Pennsylvania Volunteer Infantry during the Civil War; said to have been the oldest dentist of Pittsburg; died in Atlantic City, Nov. 22, 1908, aged 80.

Joseph Everett Kunkler, M.D. College of Medicine and Surgery (Physiomedical), Chicago, 1896; a member of the Missouri State Medical Association; for one year professor of anatomy in his alma mater and for two years health commissioner of Bloomington, Ill.; died at his home in Clinton, Mo., June 6, aged 42.

Harry Norvill Curtis, M.D. New York Homeopathic Medical College, New York City, 1881; of Marietta, Ohio; a member of the Ohio State Medical Association; and several times a member of the city council of Marietta; died suddenly at the Marietta Country Club, June 7, from cerebral hemorrhage, aged 56.

John Rutherford Ballah, M.D. University of Michigan Homeopathic College, Ann Arbor, 1900; who had done special work in bacteriology and the preparation of antitoxin; and whose last post of duty was in the Government laboratory at Regina, Sask.; died in that city May 31, from pneumonia, aged 32.

Raymond Kantner Weber, M.D. Jefferson Medical College, Philadelphia, 1905; a member of the Medical Society of the State of Pennsylvania and Reading Medical Association; a member of the staff of Reading Hospital; died suddenly June 3, from heart disease, at his home in Reading, aged 26.

George Sparks, M.D. University of Texas, Galveston, 1894; of Sweetwater, Texas; health officer of Nolan county; and chief surgeon of the Texas division of the K. C. M. and O. Railway; died in San Angelo, Texas, Aug. 2, 1908, from tuberculous laryngitis, aged 39.

Alexander Sanford Clarke, M.D. College of Physicians and Surgeons, New York City, 1876; Academy of Medicine, Nancy, France, 1887; a member of the New York Academy of Medicine; died at his home in Paris, France, May 26, from arteriosclerosis, aged 66.

Clinton Thompson Brandow, M.D. Syracuse (N. Y.) University, 1898; a member of the American Medical Association; at some time health officer of Locke, N. Y., and a trustee of the village of Moravia; died at his home in that village, June 1, aged 31.

John Scott Williams, M.D. Medical Department of the University of Iowa, Keokuk, 1865; Washington University Medical College, St. Louis, 1871; a member of the American Medical Association; died at his home in Jerseyville, Ill., June 4, from cerebral hemorrhage, aged 69.

Dwight Calkins, M.D. Bellevue Hospital Medical College, New York City, 1897; of Battle Creek, Mich.; died at the home of his parents in Allegan, Mich., June 10, from dilatation of the heart, following an automobile accident, aged 36.

Edmond Montgomery Moffett, M.D. New York University, New York City, 1882; of New York City; some-time surgeon of the Seventy-first Infantry, N. G. N. Y.; died at his home in West New York, N. J., June 11, aged 60.

Emery James Dunn, M.D. New York University, New York City, 1883; formerly of Schroon Lake, N. Y., and supervisor of the town from 1902 to 1907; died at his home in Dolgeville, June 8, from rheumatism, aged 56.

David T. Douglass, M.D., Rush Medical College, Chicago, 1871; of Colfax, Ill.; a member of the American Medical Association; died at the home of his brother in Morristown, N. J., February 5, from paralysis, aged 66.

Joseph Cobb Walker, M.D. University of Nashville, Tenn., 1900; a member of the Medical Association of the State of Alabama; died at his home in Birmingham, June 3, after an operation for appendicitis, aged 36.

Alfred Warren, M.D. Missouri Medical College, St. Louis, 1880; for many years a member of the local board of U. S. Pension Examining Surgeons; died suddenly at his home in Casey, Iowa, June 2, aged 65.

Clarence Eugene Gunther, M.D. Long Island College Hospital, Brooklyn, 1880; afterward a professor in his alma mater; died in his apartments in New York City, June 12, from heart disease, aged 48.

John Edward Snyder, M.D. Western Pennsylvania Medical College, Pittsburg, 1901; local surgeon to the Carnegie Steel Company; died at his home in Sharpsburg, Pa., June 9, from angina pectoris, aged 30.

Hugh Jones Hughes, M.D. National Medical College, Chicago, 1895; of Muskogee, Okla.; died in the Muskogee Hospital, June 6, from peritonitis, a few hours after an operation for appendicitis, aged 40.

Jeremiah Nelson Anderson, M.D. New York Homeopathic Medical College, New York City, 1864; of Toronto; died suddenly while making a call in that city, June 8, from cerebral hemorrhage, aged 68.

William L. York, M.D. Medical College of Georgia, Augusta, 1868; a member of the Oklahoma State Medical Association; died at his home in Hobart, Okla., May 18, 1908, from cerebral hemorrhage, aged 59.

J. Fain Stephens, M.D. University of Tennessee, Nashville, 1878; was shot and instantly killed in an express car on the Tennessee Central Railroad at Boma, by an insane person, May 28, aged 52.

H. V. Westmoreland, M.D. Atlanta (Ga.) Medical College, 1869; of Greer, S. C.; a Confederate veteran; died in Jefferson Medical College Hospital, Philadelphia, June 4, from nephritis, aged 64.

Robert H. Brown, M.D. Rush Medical College, Chicago, 1869; a veteran and historiographer of the Civil War; died in his rooms in Wichita, Kan., June 8, from cerebral hemorrhage, aged 73.

William C. Mason, M.D. College of Physicians and Surgeons, Keokuk, 1865; a member of the Illinois State Medical Society; died at his home in Walnut, April 3, from pneumonia, aged 68.

Theodore Freylinghuysen Kerr, M.D. College of Physicians and Surgeons, New York City, 1874, of Cooperstown, N. D.; died in New York City in May, 1909, from erysipelas, aged 64.

James Harvey Jones, M.D. Medical College of Ohio, Cincinnati, 1854; of LaCygne, Kan.; died at the home of his daughter near that place, May 29, from nephritis, aged 83.

John M. Conningham, M.D. University of Tennessee, Nashville, 1888; a member of the Tennessee State Medical Association; died at his home in Shelbyville, June 5, aged 59.

Robert B. White (examination, Ohio, 1897); for nearly half a century a practitioner of Blackford county, Ind.; died at his home in Montpelier, June 1, aged 78.

James Mattingly Moore, M.D. Tulane University, New Orleans, 1859; died at his home in Waterproof, La., April 2, from heart disease and senility, aged 80.

William T. Griffin, M.D. Niagara University, Buffalo, 1898; of Buffalo; died in the Emergency Hospital in that city, June 5, from cerebral hemorrhage, aged 32.

William Albert Rockafellow, M.D. Medical College of Ohio, Cincinnati, 1879; of Laughery, Ind.; died in Hartford, Ind., April 27, from typhoid fever, aged 53.

George R. Repp, M.D. Central College of Physicians and Surgeons, Indianapolis, 1890; of Tipton, Ind.; died suddenly in his office in that city, June 4.

Daniel H. Dornsife, M.D. Jefferson Medical College, Philadelphia, 1877; died at his home in Tunkhannock, Pa., April 25, from paralysis, aged 69.

Frank S. Burroughs, M.D. Hahnemann Medical College, Chicago, 1884; died at his home in Menasha, Wis., June 3, from locomotor ataxia, aged 55.

Ashley R. McCollough, M.D. Hahnemann Medical College of the Pacific, San Francisco, 1897; died at his home in Williamsport, Ind., June 6, aged 51.

William M. Young, M.D. Rush Medical College, Chicago, 1853; died at his home in Galesville, Wis., June 7, from cerebral hemorrhage, aged 80.

Joshua H. Wilson, M.D. Meharry Medical College, Nashville, Tenn., 1905; died at his home in New Bern, N. C., June 5, from appendicitis, aged 30.

Thomas Worcester Dike, M.D. Boston University School of Medicine, 1890; formerly of Bath, Maine; died in Westboro, Mass., April 17, aged 43.

Gettus E. Starner, M.D. Eclectic Medical Institute, Cincinnati, 1885; died at his home in Dunkirk, Ohio, June 1, from tuberculosis, aged 52.

Henry J. Boughton, M.D. New York University, New York City, 1859; died at his home in San Francisco, Oct. 20, 1908, from heart disease.

John Monlezun, M.D. Tulane University, New Orleans, 1896; died at his home in New Orleans, June 4, from tuberculosis, aged 36.

Richard D. Evans, M.D. University of Maryland, Baltimore, 1886; of Butte, Mont.; died in a hospital in that city, June 8, aged 53.

Edward W. Trowbridge, M.D. University of Buffalo, 1879; died at his home in Watertown, N. Y., June 9, aged 60.

Lovina A. Thorpe, M.D. Cleveland Homeopathic Medical College, 1883; died at her home in Cleveland, April 23.

George Storrs Fife, M.D. surgeon in the Civil War; died at his home in San Francisco, Dec. 5, 1908, aged 72.

1. Diet. —Wiley calls attention to the increasing belief among physicians that diet is an important factor, both in the production and in the cure of disease. Accepting the modern theory of specific infection in the cause of disease, we should, he asserts, also accept its attendant theories, which he states briefly as follows: A perfectly healthy, well-nourished organ doesn't easily become infected with any disease germ. This being so, it is evident that food, or diet, must play an important part in the prevention of disease, because the normal condition of the body and the maximum power of self-protection is directly dependent on the character and amount of the diet. As to what is the best diet, Wiley states, as a general proposition, that the ordinary normal diet of man selected by the necessities of nutrition and by taste, is considered, all in all, the best. With regard to the theory advanced by some that the diet of the average man contains too large a percentage of protein, Wiley is not willing to agree to the extreme claims made by those who advance it. While he will admit that the amount of protein consumed may be greater than is desirable, he would not go to the extreme of supposing that it should be diminished by one-half or two-thirds or even more. On the subject of mastication he would also take a conservative stand. While admitting both the desirability of thorough mastication and that the average individual does not masticate his food enough, yet he is of the opinion that to carry mastication to excess might result first in diminishing the actual quantity of food necessary, and second, in interfering with the proper process of digestion. He ventures the question whether it may not be possible that excessive mastication, that is, converting the meal hour into a mere mechanical exercise, may not in the end threaten the human family with grave dangers of insufficient nutrition.

In discussing the therapeutic value of food, he touches on the subject of adulteration and sophistication. He asserts that while the healthy individual may use considerable quantities of milk, for instance, containing formaldehyd, boric acid or sodium benzoate, or other preservatives and receive no apparent injury, the case is entirely different with the invalid. The first requisite which we could make for foods for invalids is that they should be pure. The next most important thing is to find a pure food which the invalid can digest. In closing his article, Wiley calls attention to the fact that the science of nutrition is unfortunately not very extensively included in the curricula of our medical schools. In his opinion the time will come when we shall see the professorship of dietetics in medical schools advanced to the same rank as that of medicine. He goes even further and states that "the practice of medicine in the future will be largely a practice of dietetics."

11. Sanatorium Treatment of Tuberculosis.—Fishberg deplores the fact that the average consumptive and often his medical adviser look on the sanatorium as the only place where he may be cured of his disease. Those patients who for some reason can not gain admission to sanatoria consider themselves doomed, lose courage, and often fail to make any attempt to submit to treatment at home. The available sanatoria are overcrowded and patients have to wait for months before accommodations can be found for them in existing institutions. Considering the large number of living consumptives and the enormous sum of money necessary to invest for the equipment and maintenance of sanatoria, it is hardly to be hoped that in the near future the number of beds will be increased to such an extent as to accommodate all those who are in need of institutional treatment.

It is well known that many more consumptives are being cured at home than in sanatoria. Autopsy findings show that about 70 per cent. of humanity have had tuberculosis some time during their lives. It is also established that the majority of these have been cured of the disease. Even conceding that the well-to-do, who only rarely come to autopsy, would not show such a large proportion of tuberculosis, it argues in favor of the curability of consumption among the poor in their homes, in their usual milieu.

The sanatoria only admit incipient cases, which display no constitutional symptoms, such as fever, rapid loss of weight, etc. These are just the cases that are, under proper care, getting along well at home, at a much lower cost to the patient and to the community. Acute cases, as well as active cases with fever, emaciation, anorexia, albuminuria, etc., are not doing well in either place. The lower mortality rates in sanatoria is in a measure due to the fact that all unfavorable cases are persuaded to leave for home.

The ultimate results of sanatorium treatment are not as good as some authors lead us to believe. The German sanatoria show results that about 40 per cent. of all the cases are able to work and earn at least one-third of the standard wage at the expiration of five years after discharge. Considering that the average duration of life of the consumptive is about seven years and that the sanatoria admit only incipient cases, it is a question whether 40 per cent. of a given number of incipient cases treated at home would not show similar results. According to Hammer and Croissant the results obtained in the treatment of consumptives in dispensaries are about the same, and from the standpoint of the duration of the favorable results, even better. The excellent results obtained by Trudeau and reported by Brown are not conclusive. They by no means prove that the mortality of the sanatorium patients is lower than that of the patients who are cared for at home. It is not fair to compare the death rates of consumptives with those of the general population when testing one method of treatment with another. The only conclusive method of comparing results of treatment is to elicit the mortality of sanatorium patients as compared with results obtained in home treatment, but such a study has not yet been made on a large scale. Economically sanatoria are expensive. The initial outlay for building and equipment, which amounts to about \$1,000 per bed, and maintenance, which amounts to about one dollar per day per patient, precludes at present the hope of building and maintaining a sufficient number of sanatoria to provide for all consumptives in any country. The fact that there are indications that the results obtained in dispensaries are not below those obtained in institutions, and at a much lower rate of expense, urges that we must turn our attention to the home treatment of tuberculosis.

The prophylactic results of sanatoria are of negligible value, considering that they admit the incipients and refuse the most dangerous—the advanced cases.

12. Syphilis and Parasyphilis of the Nervous System.—Hecht concludes his résumé of this subject as follows:

1) Syphilis and parasyphilis of the nervous system continue to stand in direct and indirect causal relation to primary syphilis, although their nosologic position is very likely to undergo revision if the Schaudinn discovery and sero-diagnostic values of to-day stand the test of time and fur-

ther development; (2) the therapeutic position, it is hoped, will also share in this signal advance, but in the expectant interval it is well to insist that neither a routine nor a haphazard administration of antispecifics is commendable; (3) treatment to be intelligent must meet the requirements of each case with due regard for the many collateral, chiefly supportive measures; (4) antispecifics, when indicated in these conditions, mean mercury and iodids; (5) in the vast majority of the cases occurring in neurologic practice, mercury by inunction is the method of choice; (6) the Fränkel exercise treatment for the ataxia of tabes loses none of its efficiency if a departure is taken from the original complex plan to a simpler one.

14. **Some Coroner's Cases.**—O'Hanlon describes several unusual cases which came under his observation as coroner's physician. These were multiple fractures of the base of the skull without outward evidences of a severe injury, the carotid artery pierced by the rib of an umbrella, removal of the entire placenta by curetting, with a five months' fetus left in the uterus, and death from the kick of a horse.

3. **Reinfection in Syphilis.**—Hutchinson gives a number of instances in which contrary to the general experience a primary chancre showed itself to be autoinoculable and a number of other cases in which reinfection occurred in patients who had been cured of a first or even second attack of syphilis. The period at which reinfection may take place is as short as eighteen months and its length appears to be inversely proportional to the energy and success of the treatment of the former infection. The second infection may be lighter or more severe than the first.

- 17 Treatment of Severe Cases of Chronic Colitis. P. L. Mumery.

11. **Gastroenterostomy.**—Bidwell reports a mortality of nearly 5 per cent. in gastroenterostomy operations for ulcer and he states that the estimate of 1 per cent. mortality, given by some authors is entirely too favorable. His ex-

perience makes him hesitate to assert that the risk of a gastroenterostomy is practically nil. This mortality should be contrasted with that under medical treatment which he reckons at 10 per cent. The immediate results are very good but unless the pylorus is constricted the stomach contents will eventually find their way through it again and the gastroenterostomy opening will close. By investigation of the ultimate results Bidwell found that about 56 per cent. of the patients were absolutely cured and another 26 per cent. were in almost perfect health. He regards the operation as indicated in every case of chronic gastric ulcer which has resisted medical treatment or has recurred after it. The presence of dilatation is an absolute indication for gastroenterostomy. The operation is also indicated in every case of duodenal ulcer as soon as it can be diagnosed, as practically no case of duodenal ulcer is permanently cured by medical means. In acute gastric ulcer the indications for operation are repeated severe hemorrhages which are threatening the patient's life; and, secondly, symptoms of acute pain and shock, suggesting that the ulcer is spreading toward the visceral peritoneum, and that perforation is imminent. Bidwell believes that an ulcer in any part of the stomach or duodenum can be cured by gastroenterostomy; but if the pylorus is not stenosed it must be occluded at the same time, otherwise the results are not likely to be permanent.

- 21 *Ovarian Transplantation. G. A. Casalis.

21. **Ovarian Transplantation.**—Casalis reports a case in which he transplanted in 1905 the sound portion of the left ovary in a woman aged 26, on whom he operated for adherent retroverted uterus with double tubo-ovarian disease (gonorrheal infection). She has menstruated more or less normally since, but during the last year crises have preceded each period, of a somewhat alarming character: she suffers violent headache, intense abdominal pains, three or four severe rigors, cyanosis of the face and extremities, becomes almost pulseless, vomits incessantly and frequently passes one or two offensive motions. Then a reaction sets in with perspiration, flushed face, full and bounding pulse, and the menses appear. Casalis regards it as an early surgical menopause in a woman now just 40. The ovary is undergoing retrogressive changes. It is interesting that the ovarian transplantation was successful, even if only momentarily so. The ideal would be to perform with transplantation an arterial anastomosis, but that appears difficult if not impossible.

- 25 Simplified Technic for Extirpation of Epithelioma of Pharyngeal Isthmus. Jacques.

23. **Gonococcus Septicemia.**—Dieulafoy reiterates that gonorrhea is not merely a local affection but at any moment it may become a septicemia which may prove rapidly fatal, or it may induce acute and chronic joint affections, ulcerative and proliferating endocarditis, pericarditis, bronchopneumonia, meningitis, infarcts in the lungs, peritonitis, pleurisy, phlebitis, etc. The urethral process may have long healed or it may vanish as the other symptoms appear. Barbiani has reported a case in which gonococci were cultivated from the blood in what was apparently a case of acute articular rheumatism. Profuse sweats seem to be characteristic of gonococcus septicemia; other symptoms may suggest typhoid. In a recent case Dieulafoy reports a typhoid syndrome, fatal in one week, which proved to be solely a gonococcus septicemia.

In two other cases described in detail the patients were convalescing from gonococcus septicaemia when typhoid fever developed. They had been treated with gonococcus vaccine and the results have impressed him with the great value of the opsonin vaccination technic.

24. **Test for Blood in Urine.**—Albrian insists on the importance of a simple and reliable bedside test for blood in the urine especially in cases in which the urine does not contain blood when the patient is in repose, but it becomes blood-stained after a walk or other exercise, showing irritation from a stone or other cause. The Meyer test has proved very reliable for this purpose. The reagent is an alkaline solution of phenolphthalein: 2 gm. of phenolphthalein and 20 gm. of potash are dissolved in 100 cc. of distilled water, to which are added 10 gm. of pulverized zinc. The mixture is boiled for four minutes, shaking the vessel; the fluid, red at first, rapidly loses its tint. As soon as the boiling fluid is decolorized, it is filtered; the reagent thus prepared will keep for months. The test is made with 2 cc. of urine mixed with 1 cc. of the reagent, well shaken; then three or four drops of ordinary hydrogen dioxide solution are added. In the presence of blood in the urine the fluid turns bright red, the rapidity of the change and intensity of the tint proportionate to the amount of blood present. The reaction occurs distinctly when there is at least 1 to 100,000 blood in the urine, sometimes when the microscope reveals only a few isolated blood corpuscles. The reaction is not influenced by the presence or absence of pus, albumin, pigments, sugar, uric acid or urates, acetone, indican, etc., nor by the ordinary drugs which the patient may have been taking.

28 *Comparative Hyperemia Test in Operating for Gangrene (L'épreuve de l'hyperémie comparée pour servir à la détermination du lieu d'amputation dans les gangrènes spontanées du pied) F. Lejars

26. **Neuropathic Ileus.**—Roch did not feel justified in operating in the case of ileus described as the young woman was a notorious hysteric and there was no tympany or pain and an operation performed the year before for a similar syndrome had revealed that the viscera were normal. Pseudo strangulation of hysteric origin had been diagnosed from the stercoraceous vomiting by several physicians consulted. The patient died before there had been supposed to be any cause for alarm, and autopsy disclosed a loop of jejunum strangulated by a band from the peritoneum. The good general condition, occasional passage of a little stool, suppleness of the abdomen and absence of pain had disguised the organic trouble but he is convinced now that stercoraceous vomiting justifies intervention, if simulation can be excluded, even when the patient seems otherwise in good condition, and when the neuropathy is known to be the main cause of the trouble.

28. **Comparative Hyperemia as Test for Point to Amputate in Gangrene.**—After removal of a constricting band the blood rushes down into the limb and the zone of vitality is recognized as it is demarcated by the diffusion of the blood in the tissues. The test has given good service in the twenty-two cases in which it has been applied to date. If the hyperemia is clearly defined and pronounced it may be possible to accept the findings as an indication that more of the limb may be saved.

39 Successful Treatment of Pulmonary Lesions with the Suction Mask (Behandlung der Lungenkrankheiten mit der Kuhnschen Saugmaske) J. H. Gieff

30. **Roentgen Treatment in Gynecology.**—Albers-Schonberg read this article at his address at the recent congress of the German Roentgen Association. He states that Roentgen treatment is an important aid in various gynecologic affections for those who understand the technic of deep exposures. It is possible with them to put an end to menstruation, to cause the shrinking of myomas and cessation of hemorrhages caused by the myomas and the menses, the arrest of preclimacteric and postclimacteric hemorrhage and the relief of menstrual disturbances at any age, with or without sterilization. He relates his experiences in these various lines, remarking that intramural myomas respond more readily to Roentgen treatment than the subserous and the pedunculated. Very large, old myomas already showing calcification resist the rays. He has never witnessed any by-effects during or in consequence of the exposures. The symptoms of the premature menopause were slight, and the appearance of "hot flashes" announced that the desired result was being attained. Older patients are more amenable to Roentgen treatment than younger women.

34. **Cholesterin Stones and Inflammation of the Gall Bladder.**—Baemeister maintains that simple stagnation of the bile is liable to cause the cholesterin to crystallize out and build up a stone by radial formation. This occurs without inflammatory processes, but the stone once formed is liable to cause irritation and secondary inflammation and possibly compression, and, by occlusion of the neck of the gall bladder, induce stagnation of the secretion in the pancreas, with acute necrosis of the pancreas in consequence.

37. **Fatal Atoxyl Poisoning.**—The patient was a man of 29, robust and free from abuse of alcohol. He was treated with mercury salicylate ten weeks after infection, after a three weeks inunction course. About 0.4 gm. (6 grains) in nine days were injected. After a pause of six days a total of 2.4 gm. (36 grains) of atoxyl was injected in the course of eight days in four injections. Symptoms of arsenic poisoning developed the next day, fatal in a few hours.

38. **Sclerosis of the Abdominal Vessels.**—Rossbach relates a case in which painful sensations for years in the abdomen sometimes increased to actual crises, but, although the left ventricle was much hypertrophied and the blood pressure high, the kidneys were intact and the capillaries free from sclerosis. The abdominal aorta, however, was in such an advanced stage of sclerosis that it was merely a rigid tube. In order to propel the blood through it, the heart had to do so much extra work that hypertrophy was inevitable. The pains in the abdomen corresponded to the clinical picture of "intermittent intestinal angiosclerotic dyspragia," "intermittent anemic dysperistalsis," "arteriosclerotic colic," and "abdominal angina."

40. **Vibration Râles.**—Rosenthal calls attention to the importance of differentiating the sounds resembling râles caused by the vibration of the trachea, especially during swallowing. They may simulate the signs of an incipient tuberculous

apical process, but they are not limited to the phases of respiration and occur both during inspiration and expiration and in the pauses. The vibration râles can be controlled by laying the finger on the patient's larynx during auscultation and watching the thyroid prominence. If the patient "swallows a little air" or takes a sip of water, the true nature of the vibration râles becomes apparent. They can be further positively differentiated by having the patient open his mouth during auscultation—this prevents the vibrations. He discusses the mechanism and the characteristics of the sounds, comparing them with the sounds when a fluid is swallowed and when it is passed through the cardia (*Schluckgeräusche* and *Durchpressgeräusch*).

Treatment of Leukemia.—B. Thomas, in *Northwest Medicine*, states that in the treatment of this condition fresh air, good diet, rest, physical and mental, are essential. Of drugs, he considers that arsenic has the most influence on the course of the disease, though iron is also of value. At present he believes that the x-ray is the best palliative treatment at our command.

Medicolegal

Opinion Evidence of Physicians and Osteopaths and Impotence in Injury Cases

The Supreme Court of Wisconsin says, in the personal injury case of *Bucher vs. Wisconsin Central Railway Co.*, that the opinions of medical men may be rejected as an insufficient basis for a finding of fact by a jury where the court is convinced that reasonable certainty is outside of the possibilities of the situation. Therefore, obvious error of opinion, opinion based on insufficient data, or nonsense clothed in words of "learned length," may be disregarded by this court as a basis for supporting a verdict.

With reference to the testimony of certain osteopaths who were put forward as expert witnesses, the court says that much of it was practically meaningless, mere nonsense, and was no doubt prejudicial to the defendant. The testimony of experts is proverbially unreliable at best, even when the experts are learned and competent, because bias is almost unavoidable on account of our mode of selecting experts, and bias requires small basis on which to ground an opinion. But where this unreliability is accentuated by a showing that the expert has little or no data on which to base the opinion, and the subject on which he expresses an opinion is one recognized by the approved learning of the times to be of great doubt and difficulty, or where the alleged expert demonstrates his lack of knowledge by his testimony, such testimony will not be sufficient to support a verdict which to this court seems unjust or excessive.

Again, the court says that it is very easy to exaggerate before a jury the cause, effect, or probable permanency of such a condition as impotence. The same is true with regard to nervous disorders. Both are easy to feign, hard to disprove, exaggerated by auto-suggestion, and it is comparatively easy for an expert to have an opinion tracing either to a particular physical injury, instead of to a disease, a mental condition or a general impairment of health.

If loss of sexual power is to be thrown into the scale as an item for which the plaintiff is entitled to be compensated in a personal injury case, common sense informs us that in practically all cases of severe injury, pain, suffering or sickness there must be and ordinarily is during such period of stress a suspension of the sexual functions. This is also true of the lower animals. The consequence of considering this as an additional or independent item of damages must be that every sick or injured man may assert his sexual impotence as a ground for recovery additional to pain, sickness, or suffering, and thus duplicate damages.

Cases may no doubt occur of direct injury to the generative organs in which some such ground of damages would not be a matter of mere conjecture, and what is here said has no reference to such cases. But if one in consequence of an injury is continually suffering pain and sickness, he is not apt to be concerned about his sexual powers or pleasures. If so, pain must have lost its usual distracting effects, and affliction its usual chastening consequences.

In the instant case, if the plaintiff was sick and disabled to the extent he claimed, he would in all probability be more concerned about his pain and sickness than about his sexual potency when he consulted a physician, and there is a strong element of improbability in the claim that one really seriously ill and suffering pain, consulting a physician for relief, would also bring up the matter of his sexual impotence while in this distressful condition as an item of injury, instead of regarding it as a consequence of his pain and sickness, if he noticed it at all. Damages based on any such ground and the evidence to support such damages will be closely scrutinized by this court and limited within proper bounds, and the verdict of a jury resting on opinion evidence which does not commend itself to the court as reasonable or sound will not be given the weight to which a verdict is entitled where it rests on facts.

It was not proper for a physician to testify to the possible consequences of impotence in these words: "It may go on for years, and might terminate in something more serious."

Abortionists Guilty of Murder in the Second Degree

The Supreme Court of Iowa says, in the case of *State vs. Gibbons*, that the crime of murder in the second degree necessarily involves an act done with malice aforethought. But that term used in defining the crime is technical rather than descriptive. It does not necessarily require an intent to murder. Malice aforethought may be implied where there is no intent to kill, but an intent to commit a felony from which death results, although that result is unintended. That death resulting from a criminal attempt to commit an abortion constitutes murder in the second degree is in Iowa well settled. An indictment is not objectionable because it does not charge that the attempt to procure a miscarriage by means of drugs or instruments was made with malice aforethought. And a ruling in this case that such an indictment did not charge murder in the second degree and that, as the indictment was not sufficient to sustain a conviction for murder, dying declarations were not admissible, was prejudicial to the prosecution, for the result was not only to relieve the defendant from punishment for the higher crime, but also to make it more difficult by reason of the exclusion of dying declarations to convict for any crime.

State Board Not Required to Recognize Licenses from Other States

The Supreme Court of South Carolina says that the petitioner in the case of *Hollis vs. State Board of Medical Examiners* asked that the court by its writ of mandamus require the State Board of Medical Examiners to issue to him a license to practice medicine. The application rested on the allegations that the petitioner had stood the examinations required by the boards of medical examiners of the states of Georgia and Virginia, and had received from each of those boards a license to practice as a physician; that he presented these licenses to the defendant board of medical examiners of South Carolina, tendering at the same time the statutory fee of \$5, and demanded a license to practice medicine in South Carolina, but the license was refused; that at the time of the demand the board of medical examiners of South Carolina recognized licenses granted by the boards of examiners of the states of Georgia and Virginia under a reciprocal arrangement existing by virtue of section 9 of an act, entitled "An act to regulate the practice of medicine in South Carolina, to provide for a State Board of Medical Examiners, and to define their duties and powers," approved Feb. 27, 1904, which provides: "The board shall be empowered without examination to indorse, on receipt of the license fee of five dollars, the licenses issued by other state boards having an equal standard: Provided, said other state boards accord to the licenses of the South Carolina state board the same courtesy; and said other state board licenses, when indorsed, shall entitle the holder to registry in this state, and to all the rights and privileges thereby granted."

The statute does not require the board of medical examiners of South Carolina to indorse or recognize licenses from other states, but merely empowers them to do so on the conditions mentioned in the statute. The matter was one placed by the statute entirely within the discretion of the board. The case of *State vs. Matthews*, 81 S. C., 414, was relied on by the petitioner; but that case in its facts was the opposite of this. There the mandamus was issued against the board of pharmaceutical examiners, because the petitioner was a graduate of a reputable college of pharmacy, and the statute there under consideration provides: "No examination shall be required in case the applicant is a regular graduate in pharmacy from any reputable college; but such applicant shall be entitled to a license on furnishing evidence of his graduation satisfactory to the said board and on payment of the fee of five dollars." In that case the discretion to refuse a license to the graduate of a reputable college of pharmacy was expressly denied to the board, while in this case the statute contemplates that the granting or refusing of the license in this state to an applicant holding a license from the board of examiners of another state shall be entirely within the discretion of the board of medical examiners of South Carolina. Therefore the petition for mandamus is denied.

Presumptions as to Impotence

The Court of Appeal, First District, California, says, in the divorce case of *Hobbs vs. Hobbs*, that it knows of no presumption that impotence is incurable. There is a well-known and valuable rule of olden times, often repeated in the decisions and text-books, that impotence shall be presumed after three years of ineffectual cohabitation, and shall not be presumed before. It is sometimes called the rule of triennial cohabitation. At the end of three years, if the marriage remain unconsummated, impotence was presumed. The plaintiff was required to show a triennial cohabitation, or that the defect or cause was obvious to inspection; and in all cases where the condition of the sexual organs was an essential element in the proofs the court ordered an inspection of the person by medical experts. These medical inspectors were usually three in number, and were sworn to perform their duties. In one of the old books of *English Practice* the form of the oath was as follows: "You are produced as inspectors in a cause. . . . You respectively swear that you will faithfully, to the best of your skill, inspect the parts and organs of generation of each said A. and B.; make a just and true report in writing to the judge ordinary of this court, whether the said A. is capable of performing the act of generation, and, if incapable, whether such his incapacity can be cured by art or skill; and also whether the said B. is or is not a virgin; whether she hath or hath not any impediment on her part to prevent the consummation of the marriage, and that one of you will deliver such report under your hands and seals closely sealed up to one of the registrars of Her Majesty's Court of Probate." These old rules were derived from the Canon Law, and were invariably enforced in the Ecclesiastical Courts. While in modern times the courts do not adhere to the old rule as to three years' cohabitation in order to raise a presumption of impotence, yet they hold that the contract of marriage is of too solemn a nature and of too much importance to society to be set aside and annulled except on clear proof of such physical condition of one of the parties at the time of the marriage that it would operate as a fraud on the other party to compel them to live together as husband and wife in name only, without the comforts of marriage and with no prospect of children. It is therefore in all cases necessary for the plaintiff to establish the impotence at the time of the marriage and its incurable nature.

Microsphygmia.—This is the name given by G. Variot to a syndrome characterized by a special and constant condition, independent of any cardiac cause, of imperceptible or almost imperceptible pulse in most or all of the arteries in which it is usually readily perceived. There is no anatomic lesion discoverable as a cause in the circulatory system and it appears to be due to permanent spasm of the arteries. Variot finds it associated with mental debility and ichthyosis, usually existing since childhood or congenital. Richet, *fils*, and Saint Giron have pointed out that mental debility or idiocy is much more commonly associated with the symptom than is ichthyosis, and Variot himself has observed one case without that feature. Others have observed the syndrome attending hereditary syphilis, and Vincent (*Bull. Soc. méd. d. Hôp.*, Nov. 20, 1908, p. 588) has put forward a theory of thyroid dystrophy to account for the symptom, based on some observations in adults. A case of microsphygmia apparently of long duration but unattended by mental failure or ichthyosis, and with probable thyroid dystrophy, is reported in the same publication Feb. 12, 1909, p. 263, by Morichau-Beauchant (of Poitiers). While Variot (*Bull. Soc. méd. d. Hôp.*, Dec. 4, 1908) holds that microsphygmia may coexist with myxedema, he doubts the direct relation between the two. It is possible he thinks, that this arterial spasm, which is the most constant and characteristic feature, may have for its cause several diuerent factors, syphilis, myxedema, etc., and that it would be impossible to attribute all the forms of cerebral and vasomotor trouble that seem at times to occupy the first place in the etiology of microsphygmia to any one cause.

the Chair

The Value of the Nurse in the Public School

DR. THOMAS A. WOODRUFF, Chicago: Although primarily the work of the school nurse is for the purpose of promoting cleanliness and preventing disease, her services are valuable in more ways than can be enumerated in rules and regulations printed for her guidance. The school nurses of Chicago are under the joint supervision of the Chicago Department of Health and the Visiting Nurses' Association. They are paid by the city and each nurse has charge of a certain number of schools. They have proved themselves to be useful and indispensable to the public school system, as well as to the Department of Health of Chicago. A summary of the benefits of their work shows: 1. A decrease in the spread of contagion. 2. They teach the parents, family and children cleanliness and personal hygiene. 3. They instruct the mother in the care of her children and impress on her the benefits to be derived from cleanliness, fresh air and right living. 4. They render more effective the efforts of the medical inspector by visiting the homes of the children and reporting back information of the conditions found there. 5. They frequently find cases of deprivation and disease in the home which would otherwise go undiscovered and the work of the medical inspector would be of little advantage in the school. 6. They make it possible to treat cases of minor ailments in the school.

DISCUSSION

DR. MCBRIDE, Los Angeles: The question of the inspection of school children was first simply one of inspecting the eyes and ears. It now involves the general hygiene of the school children, which means ultimately an attempt to recreate the vigor of the race. I have been much interested in the work of Dr. L. Gulick of New York in his introduction of calisthenic exercises after every recitation.

DR. HELEN C. PUTNAM, Providence, R. I.: The calisthenics carried out by Dr. Gulick are, I believe, corrective to the attitudes of the children assumed while sitting. They are intended to straighten the back, expand the chest, put in action the leg muscles, bring the shoulders together, throw back the head, and during the few minutes in which they are carried out the windows are thrown wide open.

DR. CASEY A. WOOD, Chicago: Of all the work done by the school nurse I have been most impressed by the influence she has on the mothers of the children in their homes. I believe the work is much more effective and permanent than it would be were the work confined to the schools. The work is much more vital and she is really a hygienic missionary, possessing the highest qualifications for the work.

DR. LEARTUS CONNOR, Detroit: The work of the school nurse appeals strongly to me because it is a part of the education by which the children shall be made to live in the conditions in which they have to do their work, enabling them to be of some use in the world. Most children do not "make good," not through any fault of their own, but because of the system of education of the past.

DR. H. TOMLINSON, St. Peter, Minn.: While it is absolutely necessary that the immediate physical welfare of the child should be studied and those conditions which are harmful eliminated, yet the work will be only properly done when certain definite lines of work are laid out in determining the physical capacities of the child; how far any impairment interferes with his capacity to study and to acquire knowledge. If a child physically unfit and primarily limited in mental capac-

ity is placed in the routine of the public school the result will be disastrous. A careful biological analysis of the individual child is absolutely necessary.

DR. HELEN C. PUTNAM: Do the school nurses of Chicago take the rôle of educators in parents' clubs; also are there any complaints from physicians that the medical inspector and school nurse deprive them of their legitimate patients by sending them to specialists and to hospitals?

DR. JOSEPH K. WEAVER, Norristown, Pa.: I feel that the true function of the school nurse is the home hygienist, and that the work of the medical inspector and of the school nurse must necessarily go together, the nurse seconding the work of the inspector by going into the home, teaching the mother the principles of the preparation of food and of cleanliness.

MISS LYDIA A. KIRBY, Director of Special Schools, Philadelphia: I am sorry to say that in Philadelphia we have not a full corps of nurses, but those whom we have are so fully appreciated by the teachers that I feel that the necessary appropriation will be forthcoming. We are organizing in every ward, school and home associations, in which the teachers and parents come together and the mothers are instructed in cooking, home-making, cleanliness and the care of the children. There are sometimes 200 mothers present.

DR. M. P. E. GROSZMANN, Plainfield, N. J.: The claim that the school nurse in fulfilling her important function is taking the legitimate rights of the physician is due to two facts: (1) The physician is not yet considered by parents generally as a hygienic adviser and preventer of disease, but as one who is to be called in when something requires immediate cure; (2) in some families the physician is rather distrusted and is not considered a counselor. There must be, therefore, an absolute reversal of the position of the physician in the home.

DR. T. A. WOODRUFF: In Chicago the claim made by a certain class of practitioners that the school nurse was appropriating work that rightly belonged to them was thoroughly investigated by the Chicago Medical Society and was found in a large sense not true. I do not think that there is now any dissatisfaction among physicians in regard to the work. It should be remembered, however, that the physician has put the school nurse where she is, and has taught her what she knows of hygiene. If the school inspector falls far short of what he should be, it is not so much his fault, as it is due to the fact that he is underpaid. He can not give the time to following the cases into the home. In some cases he won't do it. In other cases the families are afraid of the physician and will hide the children. The nurse, on the other hand, is welcomed and allowed to do whatever is necessary. Unfortunately, the nurses are so poorly paid that it is going to be difficult to secure a sufficient number.

(To be continued)

CONNECTICUT STATE MEDICAL SOCIETY

One Hundred and Seventeenth Annual Meeting, held in Hartford,
May 26-27, 1909

The President, DR. SELDOM B. OVERLOCK, Pomfret, in the
Chair

Officers Elected

The following officers were elected: President, Dr. Samuel D. Gilbert, New Haven; vice-presidents, Drs. Theodore R. Parker, Willimantic, and William J. Tracy, Norwalk; secretary, Dr. Walter R. Steiner, Hartford; treasurer, Dr. Joseph H. Townsend, New Haven; delegates to the American Medical Association, Drs. D. Chester Brown, Danbury, and Everett J. McKnight, Hartford.

New Haven was chosen as the next meeting place.

Bacterial Vaccines in Treatment of Disease

DR. C. J. BARTLETT, of New Haven, first outlined briefly the development of the opsonic method. Bacterial vaccines were contrasted with antitoxins and the general principles underlying vaccine therapy were discussed:

This method of treatment is specific in the strictest sense of the word. In the majority of infections, autogenous vaccines must be used in order to obtain satisfactory results.

Wright insists that the frequent determination of the opsonic index is essential, but in this country many of those who are using vaccines are evidently disregarding the index and have obtained good results. Localized staphylococcus infections are particularly favorable to this form of treatment. Hartwell and Lee emphasize its especial value in the treatment of boils about the face to prevent scarring. It has proved of value in severe cases of Rigg's disease. According to Wright, antiseptics should not be used together with vaccine therapy as they counteract the action of the opsonins. Ross and others report excellent results in cases of erysipelas. Gabritschewsky's prophylactic work against scarlet fever by means of streptococcus vaccines is interesting but requires confirming.

A few cases of streptococcus endocarditis and puerperal sepsis with favorable outcome under vaccine therapy are reported but this result is the exception and not the rule. Auto-genous, not stock streptococcus vaccines, should always be used when possible. Of gonorrheal infections, gonorrheal arthritis appears most amenable to vaccine therapy. Aronstam has reported favorably on its use in acute urethritis and Hollister and others in gonorrheal vulvovaginitis. In cystitis and pyelitis, due to the colon bacillus, it has been used with good results. In typhoid Richardson's results and the recent report of Watters are encouraging. Two cases of actinomycosis, successfully treated, have been reported. Pneumococcus endocarditis is not favorably affected by vaccines. A case of favus of twenty-three years' standing, cured by vaccines, has just been reported by Perssons. From theoretical considerations, it seems probable that better results than yet reported may be obtained in general infections if appropriate vaccines can be used early in the disease. Latham's results in administering vaccines by mouth indicate the possibility of simplifying vaccine therapy. For the successful employment of this method of treatment, more accurate diagnoses than in the past must be made. Laboratory experts must be called on more frequently than heretofore.

Venesection and Dermatology

DR. THOMAS M. BULL, Naugatuck, referred to the antiquity of venesection as a remedial measure; he discussed its value and emphasized the necessity of selecting patients for this purpose. He related cases of eczema and psoriasis in which it had been of value, and closed with some theoretical considerations as to its use, and described the technic.

Localizations of Lesions of the Genitourinary Tract

DR. F. H. COOPS, Bridgeport: It is necessary to have a definite and systematic plan of procedure in order to arrive at an accurate diagnosis. The perfection of the older clinical methods and the invention and use of such modern instruments as the urethroscope, the cystoscope, the different urinary segregators and x-ray photographs has made urology one of the most exact of the medical sciences. As complete a history of the case as possible should first be obtained. Next the secretions and excretions of the tract should be thoroughly investigated, mechanically, chemically and microscopically. When we have thus arrived at certain conclusions regarding the nature and location of the trouble we make use of the different instruments and other mechanical devices at hand in order to clinch our diagnosis. The patient and the experienced investigator going over in this way each portion of the tract in turn, noting and properly interpreting all that he hears, feels and sees, will be fully rewarded for the pains that he has taken.

Ocular Manifestations of Systemic Diseases

DR. M. H. GILL emphasized the importance of using silver nitrate in the eyes of the new-born, and urged the making of that process obligatory by statute. He also spoke of the necessity of examining a child's refraction on the first appearance of a "crossed eye." He advised frequent inspection of the eye ground in general constitutional disturbances, and showed the necessity of referring patients to oculists rather than to opticians.

Partial Responsibility of the Insane

DR. FREDERICK T. SIMPSON, Hartford, said in part: Psychiatrists while studying all other aspects of insanity have ignored the question of responsibility. They have included under insanity in the most recent text-books such conditions as neurasthenia, psychasthenia, hysteria, chronic alcoholism, etc. All the psychoses may be mild, moderate or severe in intensity. There are all degrees of departure from the normal type of mental soundness. It is therefore an absurdity for the law to require that a physician declare a man either totally sane and responsible, or totally insane and irresponsible. It must be recognized that there are different degrees of impairment of responsibility as there are different degrees of impairment of any and all of the other powers and capacities of the individual. Many patients belonging to these classes of mildly insane can not be shut up in asylums. Since they are allowed to go at large, they must be held responsible for their conduct. In point of fact, with most insane persons, the knowledge of right and wrong is well preserved and a large proportion of them are, in their outside social relations, well-behaved persons. They can do wrong like other persons, and usually acknowledge it or excuse it in the natural way. Punishment, or discipline of any sort has the same deterrent effect. The physician has too often sought to rescue the accused on trivial disturbances of mental health. If the medical profession frankly acknowledges that the insane are by no means irresponsible, and that the degree of responsibility is a matter to be determined by careful investigation of all the facts, the present irrational distinction made between medical and legal responsibility will be dropped and the interests both of justice and humanity will be furthered.

Hemolysis in the Diagnosis of Malignant Tumor

DR. HAROLD S. ARNOLD, New Haven, reviewed some of the literature on this subject and gave his experience with hemolysis in 53 tests, at the New Haven Hospital:

Of 13 malignant tumors, 12 gave positive hemolyses; 4 benign tumors gave negative tests; of 32 cases of acute and chronic disease, 1 only, a case of lobar pneumonia, gave a positive reaction. It may be concluded, therefore, that the test, while not infallible, is nevertheless a valuable aid in the diagnosis of malignant growths.

The Influence of Thoughts and Emotions in Causation of Disease

DR. SAMUEL D. GILBERT, New Haven, treated this subject from the standpoint of the general practitioner:

Literature abounds in illustration of such influences. Our environment as a nation is largely and chiefly responsible for the prominence of mental conditions as a factor in the etiology of diseases to-day. The way of living now is different from that of thirty years ago. There were then no telephones, electric cars, wireless telegraphy, automobiles, four and a half days transatlantic steamships, etc. Modern inventions with the labor problems, and the ways of doing business, and the conduct of the sports all conspire to make the whirl and rush of our daily life. The thoughts and emotions exercise their influence on and through the stomach, on nutrition and sleep. This begins at birth. The first individual impressions made on the infant are evident by them. Hence the importance of right influences exercised by nurse and parents; right home surroundings and atmosphere at this early period, as a healthy normal child makes a healthy and sane man or woman. Three of the most common emotions are fear, worry and selfishness. Under fear, fear of bacilli is mentioned as a growing emotion among others. Fear is a direct cause of paralysis agitans among other diseases. Selfishness is the bottom of the hysterical state and frequently in the rich is a cause of neurasthenia. There is one kind of influence causing diseases for which we as physicians are responsible, and that is due to our relations with our patients. Dr. Cabot is quoted as making these points: First, the doctor habit; second, the physician as a cause of disease; third, psychical harm from physical diagnosis and treatment. The physician should have the moral courage to tell patients who are not ill that

they should stay away for their own good. The physician who treats every little ailment, particularly local troubles as of the throat or vagina where they are trifling, is in that way making a hypochondriac and so is himself a cause of disease. The doctor should not make too frequent and minute examinations in, for example, chronic cardiac or kidney disturbances, as he is thereby doing psychical harm. We are often blind to the fact that disease is not caused by some hidden germ or material cause, but by something right before our eyes, *i. e.*, the influence of the thoughts and emotions.

The Physician as an Educator in Sanitation

DR. FRANK E. GUILD, Windham: Any study of public hygiene is largely a matter of the destruction and prevention of the dissemination of pathogenic bacteria. Our present knowledge of the cause of disease is due to the comparatively recent discoveries of the nature and activities of the bacteria, which was made possible by the discovery and application of the achromatic lense to the microscope. This was of great value as a help in diagnosis and as a means of identifying micro-organisms now known to be the cause of many diseases. The demonstration by Louis Pasteur, that bacteria caused a large number of diseases did away with the numerous and conflicting theories previously held. With this new knowledge, the responsibility to the public of the physician was greatly increased, especially so when we consider that 50 per cent. of all maladies are extrinsic and preventable. The epithelium of the skin and mucous membrane guards the living body from pathogenic bacteria. There are four avenues of entrance for these germs to the living organs: (1) inoculation by wound infection or by bites or stings of infected insects; (2) through the alimentary canal; (3) through the respiratory system; (4) through the genitourinary apparatus. To the physician and sanitarian belong the care and prevention of such infection and their endeavor should be to guard these portals. Before Grassi proclaimed *Anopheles claviger* as the true transmitter of malaria, or before typhoid fever was known to need no period of incubation in the soil, or before Reed, Carroll, Lazear and Agramonte proved the mosquito to be the true carrier of yellow fever, infectious diseases were divided into contagious, miasmatic and miasmato-contagious. We recognize the alertness of the medical profession in its fight with tuberculosis and we expect to see the time when it will be under control. But while fighting this disease, we must with equal zeal guard against all infectious diseases. From August, 1908, to April, 1909, there were in the state of Connecticut 2329 deaths from infectious diseases other than tuberculosis. How many of these deaths and how much of the cost and discomfort of those who did not die but were sick with these diseases might have been prevented, it is impossible to say. Much of this condition was due to ignorance and carelessness. If the state would be more generous with its money in hiring men trained in sanitation to supervise the instruction and care of these matters, this condition would be different. Pure and cheap milk is a necessity. How to get it is a problem to be solved. How to prevent river contamination from urban sewage and suburban contamination of wells and springs, and how safely to quarantine families and how to disinfect rooms in such a manner as to be perfectly safe for future habitation, are other problems to be solved. These problems are capable of solution through educated supervision. Not only health officers but the masses must be taught in the same way as is being done to-day in the effort to exterminate tuberculosis, and this instruction must be furnished by the physician.

Importance of More Careful Surgical Diagnosis and the Aid Afforded by Various Differential Tests

DR. HARRIS F. BROWNLEE, Danbury: One of the greatest evils in surgery to-day is that of faulty diagnosis, which outside of the large surgical centers prevails to an unnecessary degree among both physicians and surgeons. Errors are frequently unavoidable owing to the real difficulties of the case, but often occur from lack of care in taking the history and making the examination. Diagnosis is an art, a science and an intuition, and no department of medicine or surgery is

more worthy of cultivation. Illogical deductions may be drawn from accurate facts, but more often logical deductions are drawn from inaccurate facts. However these errors may be arrived at, they lead to lack of confidence on the part of the public and to general discredit.

Differential tests: The blood count is an assistance if interpreted as indicating an inflammatory process and not an established condition. The Cammidge test is apparently positive in pancreatic affections. The demonstration of occult blood and the estimate of hydrochloric acid is helpful in diagnosis of cancer of the digestive tract. The Roentgen ray is positive in demonstrating renal, ureteral or vesical calculi, but negative as to biliary calculi. By ureteral catheterization, the administration of methylene blue, indigocarmine and phloridzin, by cryoscopy and by noting the electrical conductivity after administration of indigocarmine we gain information regarding affections of the urinary tract, and as to the functional activity of each kidney. By noting changes in the blood pressure and by lumbar puncture we gain knowledge of cerebrospinal affections. By paracentesis we determine the character of various effusions. All these tests are helpful and hopeful; we should know their value and be able to interpret their meaning even though uninformed as to their technic, which naturally belongs to the men of the laboratory. They are, however, not a short cut to diagnosis. A careful painstaking history, and a thorough examination constitute the true basis of accurate diagnosis. We can not all be leaders or pioneers, but we can at least be intelligent followers.

Appendicitis in Pregnancy

DR. OTO G. RAMSAY, New Haven: There is change in general opinion as to severity or fatality of this condition. There is no apparent relationship between pregnancy and a primary attack, though it is probable that pregnancy increases liability to a second attack. Pregnancy increases severity or fatality of suppurative cases. Operation is indicated in every case in which there is the least suspicion of suppuration.

Extrauterine Pregnancy

DR. P. H. INGALLS, Hartford, discussed the diagnosis of ectopic gestation and when to operate:

It is an error to interfere when the patient is pulseless and in a condition of profound shock. By rallying the patient from profound shock, before operating, I find that my results are more satisfactory. These cases are not rare; many of them go on to tubal abortion and the patients recover without attention. The diagnosis is often difficult. When a diagnosis is made, operation should be done before rupture; when rupture has occurred the patient should be allowed to rally and then operated on.

Heredity in Crime

DR. CARMALT's paper on heredity in crime refers first to the well-known rules observed in breeding of domestic animals and considers that natural selection is observed nearly as strictly as in man:

Many names which have become famous in all departments of learning are instances of this, for example, the marriages of persons of like tastes, while marriages between these people and degenerates are rare. The Edwards family, *i. e.*, the descendants of Jonathan Edwards, may be taken as an illustration. Galtori's investigations show that there is a fairly well-marked hereditary influence by which different professions keep up the lines; there are instances of theological families, legal families, physicians and scientific families. There are authorities for classifying high moral qualities as inheritable. *Per contra* consider "the Jukes," the "tribe of Ishmael," the Owens family as equally marked instances of degenerate families. There are difficulties in getting genealogic records of criminals. There is a definite relation of pauperism to crime. Pauperism, idiocy, imbecility, epilepsy are all inheritable and associated diseases and I argue that crime belongs to them. It is the duty of the state to prevent the propagation of such types, and I advocate the "sterilization of the unfit," both criminals and imbeciles.

Effect of Removing Large Portions of the Small Intestine

DR. J. M. FLINT, New Haven, referred to three investigations, which have already been published on this subject, with results that differ radically, both as to the percentage that may be removed safely and with reference to the effect of the resection on the organism. A reworking of the problem justified the following conclusions:

1. As much as 75 per cent. of the total small intestine may be removed without fatal results. The animals may gradually return to a condition of practically normal weight and metabolism when maintained on a favorable diet under good conditions.
2. The animals suffer from a severe diarrhea, loss of weight, ravenous thirst and appetite from which they gradually recover until conditions may return to those of a normal animal. They remain, however, extremely sensitive to unfavorable conditions of diet and living.
3. Metabolic studies on such animals show that there is a marked increase in the elimination of the nitrogenous, fatty and carbohydrate elements of the food. Their elimination may reach 66 per cent. of the diet content. After compensation is established, on a rich easily assimilated diet, digestion goes on as in a normal dog, except for an increase in intestinal putrefaction as indicated by the amount of indican in the urine. An increase in the fatty content of the food may lead to an increased elimination of nitrogen and fats to a point about 25 per cent. above normal. The carbohydrates, on the contrary, are absorbed to a degree considerably above normal after the compensation is established.
4. The compensatory process consists in a hypertrophy of the remaining portion of the small intestine as well as a hyperplasia. There is no regeneration of the villi or crypts. Computation makes it probable that approximately the original area of the intestine is restored by the compensation. There is apparently no adaptation on the part of either the stomach or the colon to take over the function of the small intestine, although in one case only there was a marked dilatation of the stomach. The remaining organs are normal macroscopically and microscopically.
5. There are 30 cases in the literature in which over 200 cm. of the intestine have been resected. The mortality is 20 per cent., which is probably much lower than it should be owing to the greater probability of successful cases finding their way into literature. Human patients behave in general like the animals. They show similar metabolic disturbances. In one case (Schlatter's) there was distinct evidence of a compensatory process. No regeneration or hypertrophy has ever been reported on a human case.
6. Resection of the human intestine is never an operation of choice. The surgical rule has been and will continue to be a resection of the minimum amount which the pathologic conditions allow. From the metabolic studies it would seem wise to give these patients a rich and easily assimilated diet, relatively poor in fats and relatively rich in carbohydrates.

Practical Points in the Administration of Anesthesia

DR. RICHARD F. RANX, New Haven, related some practical points he had found of use in giving anesthetics. After an experience with the drop method in nearly 300 cases, he preferred it to the cone or Bennett inhaler, the two methods he had previously employed. In speaking of the choice of anesthetics he said that in surgery of the brain chloroform was preferred, but that ether was better in nephritis or diabetes. At night ether is less dangerous than chloroform.

The Natural Channels of Absorption Evoking the Chemical Mechanism of Gastric Secretion.—By means of a specially devised rubber balloon, shaped like a washer, Edkins and Twedy (*Jour. Physiol.*, 1909, xxxviii, 263) found it possible to separate functionally the pyloric from the fundal end of the stomach in experimental animals, and to study the independent secretions of the two parts. Experiments on animals in which all the gastric branches of the vagus nerve were cut, indicate that secretion in the stomach is evoked, partly at least, by certain substances occurring in the course of digestion, which are absorbed by the pyloric mucous membrane and which liberate a hormone, gastrin, that acts as a secretion stimulant for the fundus mucosae. It is further found that a hormone is produced in the duodenum which stimulates secretion in both fundus and pyloric regions of the stomach. After washing out the stomach with warm normal salt solution, and introducing 2 per cent. meat extract solution under slight pressure into the duodenum in the fasting state, a liberal secretion occurred in the region of the divided stomach. The secretion of the pyloric end was alkaline; that of the fundus showed a maximum acidity of 0.16 per cent. hydrochloric acid. When the fluid substances were confined to the pylorus the fundus responded with a secretion containing both hydrochloric acid and pepsin. Of the different food substances employed, either in the pyloric region or duodenum, the effectiveness was apparently in the following order: meat extracts, dextrose, dextrin, and last, hydrochloric acid. If the food substances were confined to the fundus region there was no evidence of any secretion whatever.

 SOUTH DAKOTA: Watertown, July 14-15. Sec., Dr. H. E. McNutt, Aberdeen.
 UTAH: Salt Lake City, July 5. Sec., Dr. G. F. Harding, 310 Templeton Bldg.
 VERMONT: Burlington, July 13-15. Sec., Dr. W. Scott Nay, Underhill.
 WASHINGTON: Seattle, July 6-8. Sec., Dr. Kenneth B. Turner, Walker Bldg.
 WEST VIRGINIA: Charleston, July 13-15. Sec., Dr. H. A. Barbee, Point Pleasant.
 WISCONSIN: Madison, July 13-15. Sec., Dr. J. V. Stevens, Jefferson.

Illinois January Report

Dr. J. A. Egan, secretary of the Illinois State Board of Health, reports the written examination held at Chicago, Jan. 18-20, 1909. The number of subjects examined in was 16; total number of questions asked, 100; percentage required to pass, 75. The total number of candidates examined was 45, of whom 21 passed and 23 failed. One candidate took an incomplete examination. The following colleges were represented:

College	PASSED	Year Grad.	Total No. Ex.
Bennett College of Eclectic Medicine and Surgery. (1908)	2		2
Chicago College of Medicine and Surgery. (1909)	3		3
College of Medicine and Surgery, Chicago. (1908)	1		1
Hahnemann Medical Coll. and Hospital, Chicago. (1908)	1		1
Jenner Medical College. (1908)	1		1
College of Phys. and Surgeons, Chicago. (1894) (1907)	2		2

Oregon January Report

Dr. R. C. Coffey, secretary of the Oregon State Board of Medical Examiners, reports the written examination held at Portland, Jan. 5-7, 1909. The number of subjects examined in was 16; total number of questions asked, 114; percentage required to pass, 75. The total number of candidates examined was 52, of whom 31 passed, including one non-graduate, and 21 failed, including one non-graduate. The following colleges were represented:

College	PASSED	Year Grad.
Denver and Gross College of Medicine.....	(1907)	(1907)
George Washington University.....	(1908)	(1908)
Northwestern University Medical School.....	(1902)	(1902)

New Mexico April Report

Dr. J. A. Massie, secretary of the New Mexico Board of Health and Medical Examiners, reports the written examination held at Santa Fe, April 12, 1909. The number of subjects examined in was 13; total number of questions asked, 100; percentage required to pass, 75. The total number of candidates examined was 4, of whom 3 passed and 1 failed. Sixteen candidates were licensed on presentation of satisfactory credentials. The following colleges were represented:

College	PASSED	Year Grad.	Per Cent.
University of Alabama.....	(1899)	(1899)	80.4
Memphis Hospital Medical College.....	(1902) 78.4; (1906)	(1906)	78.9

College	FAILED	Year Grad.
Georgia College of Eclectic Medicine and Surgery.....	(1890)	70.

College	LICENSED ON CREDENTIALS	Year Grad.
Denver and Gross College of Medicine.....	(1906)	(1906)
Illinois Medical College.....	(1903)	(1906)
College of Physicians and Surgeons, Chicago.....	(1905)	(1905)
Bennett College of Eclectic Medicine and Surgery.....	(1879)	(1879)

University of Texas.....	(1904)	(1904)

Georgia April and May Reports

Dr. E. R. Anthony, secretary of the Regular Board of Medical Examiners, reports the written examinations held at Atlanta, April 30-May 1, 1909, and at Augusta, May 3-4, 1909. The number of subjects examined in was 10; total number of questions asked, 50; percentage required to pass, 80.

At the examination held at Atlanta, April 30-May 1, the total number of candidates examined was 113, of whom 91 passed and 22 failed. The following colleges were represented:

College	PASSED	Year Grad.	Per Cent.
University of Alabama.....	(1908)	(1908)	80.
George Washington University.....	(1906)	(1906)	85.
Atlanta College of Physicians and Surgeons.....	(1903) 84; (1909) the grade of 80 was reached by six; 81 by one, 82 by two; 83 by one; 84 by two; 85 by three; 86 by one; 87 by seven; 88 by three and 89 and 90 by one each.	(1903) 84; (1909) the grade of 80 was reached by six; 81 by one; 82 by two; 83 by one; 84 by two; 85 by three; 86 by one; 87 by seven; 88 by three and 89 and 90 by one each.	(1903) 84; (1909) the grade of 80 was reached by six; 81 by one; 82 by two; 83 by one; 84 by two; 85 by three; 86 by one; 87 by seven; 88 by three and 89 and 90 by one each.
Atlanta School of Medicine.....	(1909) the grade of 80 was reached by four; 81 and 82 by three each; 83 by six; 84 by eight; 85 and 86 by five each; 87 by three; 88 by two; and 89 and 91 by one each.	(1909) the grade of 80 was reached by four; 81 and 82 by three each; 83 by six; 84 by eight; 85 and 86 by five each; 87 by three; 88 by two; and 89 and 91 by one each.	(1909) the grade of 80 was reached by four; 81 and 82 by three each; 83 by six; 84 by eight; 85 and 86 by five each; 87 by three; 88 by two; and 89 and 91 by one each.
College of Physicians and Surgeons, Chicago.....	(1907)	(1907)	83.
University of Louisville.....	(1908)	(1908)	80.
Baltimore Medical College.....	(1906) 80; (1908)	(1906) 80; (1908)	85.

Leucocytes in Tuberculosis.—Because the study of the opsonic index gave uncertain results and entailed a cumbersome technique J. F. Hultgen (*Transactions of the Chicago Pathological Society*, Feb. 1, 1909) resorted to the study of the leucocytes, hoping that it might furnish a guide to the administration of tuberculin. He examined the blood in 500 cases. In incipient tuberculosis the blood picture of secondary anemia with comparative lymphocytosis was found. The same condition is found in recovery from any infection. It is occasioned in this instance by the intermittent autoimmunization against the tuberculin that enters the blood from the tuberculous focus. Hultgen proposes, therefore, to use the leucocyte count as a guide in the administration of tuberculin. The leucocytes respond readily and invariably to changes in the amount of antibodies in the circulation, as is shown by the actual and typical postinfectious leucocytic equilibrium found in recovery from any infectious disease; the development of the blood picture under the use of tuberculin; the deviation from this equilibrium when overdoses of the tuberculin are given and the subsequent return to it; by the deviation from this proportion during intercurrent bronchitis or bronchopneumonia occurring in tuberculosis; and, again, by its return toward this characteristic type. It is not good practice to use the local reaction alone as a guide in the administration of tuberculin, for there is no definite relation between the local reaction and the general immunity.

Book Notices

MARRIAGE AND DISEASE. An Abridged Edition of Health and Disease in Relation to Marriage and the Married State. Edited by H. Senator and S. Kammer. Berlin. Translated from the German by J. Dulberg, M.D., Manchester, Eng. Cloth. Pp 152. Price, \$2.50. New York: Paul B. Hoeber, 1909.

As an abridged edition of the larger work which has received so much commendation, the present volume has many advantages. A rather careful examination fails to reveal any unfavorable criticism to be made on the work. The chapter on sexual hygiene in married life by Professor Fehlbinger of Berlin is worth circulation as a separate pamphlet, for it must be confessed that there is hardly any work on this subject for the general public which is comparable to this chapter. The various divisions of the general subject are treated by Berlin physicians who stand high in scientific attainments, and the field is thoroughly covered, from consanguinity in marriage and its effects on the offspring, to professional secrecy and economic considerations.

SCIENTIFIC NUTRITION SIMPLIFIED. By Goodwin Brown, A.M. Cloth. Pp 200. Price, 75 cts. New York: Frederick A. Stokes Co.

Brown's neat little volume may be called a digest of the most practical facts—as they have appealed to him—along the line of food reform. He gives special attention to the works of Fletcher on thorough mastication of the food, and of Chittenden and Fisher on the more careful selection of food in accordance with its constituents and the needs of the body. Brown makes no claim of originality, but says that he simply is endeavoring to make accessible some of these facts which are so worthy of attention. He has succeeded fairly well, and the book supplies a definite need, regardless of whether or not one wishes to follow Fletcher and others to the full extent that their theories carry them. This book may be safely recommended to patients who are interested or need to become interested along the lines referred to.

THE HUMAN SPECIES. By Ludwig Hopf. Authorized English Edition. Cloth. Pp 457, with illustrations. Price, \$3. New York: Longmans, Green & Co. 1909.

In this work the structure, functions and diseases of the human species are compared with those of animals. It is evident that the book is intended for the general reader interested in the biologic relationships of human beings, and to such it is heartily recommendable, being instructive, easy to read, and trustworthy in most of the essentials. Especially interesting in the discussion of the ancestors of man, of the distribution of mankind, of psychology and special comparative psychology, of emotions and their expression, of social conditions and observances, and of arts and handicrafts. There are mistakes and shortcomings in the section on pathology. We are told that cultures of tubercle bacilli can not be inoculated into guinea-pigs. Nothing is said of the relation of *Treponema pallidum* to syphilis. The proof that yellow fever is communicated by a mosquito is stated inadequately. The style is simple and adapted to the demands of persons of general education.

MPDIZIAL-BERICHTE ÜBER DIE DEUTSCHEN SCHÜTZGELEITTE. Volume for 1906/7. Cloth. Pp 324. Price, 750 marks. Volume for 1907/8. Cloth. Pp 528, with illustrations. Price, 9 marks. Herausgegeben vom Reichs-Kolonialamt. Berlin: Ernst Siegfried Mittler und Sohn.

These two volumes are official reports of the diseases, sanitary conditions and other matters pertaining to health in the German dependencies for the periods indicated. The reports give a good idea of the German activities in these matters, and are of great value and interest to health officers and students of public health questions.

ATLAS AND EPITOME OF OPHTHALMOSCOPY AND OPHTHALMOSCOPIC DIAGNOSIS. By Prof. Dr. O. Haab of Zurich. Second American Edition. Edited by G. E. de Schweinitz, M.D., Professor of Ophthalmology in the University of Pennsylvania and Ophthalmic Surgeon to the University. Philadelphia. W. B. Saunders Co., 1909. Price, \$3.

ATLAS OF THE EXTERNAL DISEASES OF THE EYE. Including a brief Treatise on the Pathology and Treatment. By Prof. Dr. O. Haab of Zurich. Edition 3. Edited by G. E. de Schweinitz, M.D., Professor of Ophthalmology in the University of Pennsylvania and

Ophthalmic Surgeon to the University Hospital. Cloth. Pp 214, with illustrations. Price, \$3. Philadelphia: W. B. Saunders Co., 1909.

These books of Haab's have been found to be of such practical value that they have been translated into twelve or more languages, one of the latest being Japanese. We all appreciate the value of good illustrations; and these books contain examples of the best colored plates, showing the ocular conditions as seen in life, and also many pathologic illustrations. The text is brief and practical and the description of the external ocular diseases is preceded by a concise, accurate description of the various functional eye tests and methods for the detection of the diseases which are described in full later on. The "Atlas of Ophthalmoscopy" is in its fifth German edition, from which this second American edition is taken. Valuable additions have been made to the illustrations of both works. As Haab well says, a study of these books gives one the atmosphere of a large clinic. They should prove profitable to all physicians, and particularly those in general practice.

DIE ENTSTEHUNG UND VERBREITUNG DER TUBERKULOSE IM WEIBLICHEN GENITALTRAKT. Von Dr. Albert Blau, Assistenten der Klinik von Rosthorn in Wien. Paper. Pp 97. Price, 4 marks. Berlin: S. Karger, 1909.

Blau concludes from the literature, from experimental work, and from clinical observations that primary tuberculosis of the female genital tract is rare and that of the upper genitals practically unknown; and that, while infection of the genitals is possible, it occurs only when there are both favorable conditions of the tract itself (the puerperium, trauma, etc.) and an exceptionally virulent infecting agent. An extension upward of the disease does not occur, according to his observation, either in experimental animals or in the human female. In the cases of tuberculosis of the upper genital organs the infection is received by way of the blood.

BLUTENGEN UND AUSFLUSS AUS DEM UTERUS: IHRE URSACHEN UND BEHANDLUNG. Von Hofrat Dr. A. Theilhaber. Paper. Pp 87, with illustrations. Price, 2.50 marks. München: Verlag von Ernst Reinhardt, 1909.

Theilhaber treats first the causes of uterine hemorrhage, giving especial importance to alterations of the muscular layer and the vessels in myomatous bleeding and to the psychic and nervous influences which may excite hemorrhage in the absence of any organic disease. Disease of the endometrium, which has usually been credited with the production of hemorrhage, is in his opinion only rarely the cause of such an occurrence. Discharge from the uterus may be of two kinds, mucous and purulent. After numerous careful investigations he concludes that discharge from the uterus may be occasioned either (a) by a hypersecretion of the uterine mucosa in consequence of venous stasis, chronic metritis, disturbances of circulation, psychic or erotic stimulation, masturbation, chlorosis, etc. (neurasthenia or hysteria particularly may often be a cause of a flow; in such patients the flow occurs after every severe psychic stimulation); or (b) by a genuine endometritis, which in the majority of cases is due to gonorrhea. In the first class the flow is commonly mucous; in the second generally purulent. Only a few pages are devoted to treatment which is along ordinary lines. Cauterization of the interior of the uterus with chlorid of zinc for hemorrhage or with nitrate of silver for obstinate discharge is recommended. Theilhaber does not advise sterilization by steam although he admits that it may be effective in skilful hands. He has found scarification of the vaginal portion very serviceable in some forms of bleeding as well as in obstinate leucorrhea.

THE GENERAL CHARACTER OF THE PROTEINS. By S. B. Schryver, Ph.D., D.Sc., Lecturer on Physiological Chemistry, University College, London. Cloth. Pp 86. Price, 80 cts. New York: Longmans, Green & Co., 1909.

This is one of a series of monographs through which it is proposed to put before chemists and physiologists the latest knowledge concerning the chemistry of biologic products and its application to special tissues. Each monograph is to be complete in itself and to be written by a worker dealing with his special subject. The present number deals with the general characters of proteins, especially with reference to their value for isolation and identification of the individual members of the class. The descriptions are thorough and complete, so

much so that in some places the book may prove difficult reading for the general practitioner. For the chemist and physiologist, however, it will prove a very valuable collection of data on this subject.

AN EXPERIMENTAL STUDY OF SLEEP. (From the Physiologic Laboratory of Harvard Medical School and Sidis' Laboratory.) By Boris Sidis, M.A., Ph.D., M.D., Author of *Psychopathologic Researches in Mental Dissociation*. Paper. Pp. 106. Price, \$1. Boston: Richard G. Badger, 1909.

The uncertainty of the subject, an ill-defined feeling that sleep is not altogether a physiologic affair, together with the tendency of man to be interested more in active than in passive states—these facts are assigned by Sidis as the reason for the scant attention that is given to sleep in most textbooks of physiology. The advance of biologic knowledge no longer, however, allows even passive states to be ignored.

Sidis reviews the physiologic, histologic, psychologic and biologic theories of sleep, and discusses the difference between sleep and hypnosis and the peculiar states termed by him "hypnoidal," which lie on the borderland of waking, sleep, and hypnosis. A special characteristic of the hypnoidal states is the difficulty of fixing them for any length of time. They are the bridge that connects the waking state with hypnosis on the one hand and sleep on the other. To enter or pass out of sleep or hypnosis, one must traverse the intermediate, or hypnoidal, state. These subwaking states are characterized by the trait of suggestibility.

In the study of sleep, Sidis asserts, we must devote our attention to the investigation of these transitory, subwaking states. He undertook, therefore, in the physiologic laboratory of the Harvard Medical School, a series of experiments on frogs, guinea-pigs, cats, dogs, infants and adults. His point was to induce sleep and its allied states, subwaking and hypnoidal, keeping as close as possible to the conditions of normal and abnormal suggestibility. To this end, monotony, limitation of voluntary movements, and limitation of the field of consciousness were found to be essential. He records in separate chapters his experiments on the lower animals, which lead him to the conclusion that all these animals are subject to the same condition of sleep states; and that, phylogenetically, the hypnoidal is the primitive "rest state," out of which sleep and hypnosis have become differentiated. Experiments on children and adults confirmed the conclusions arrived at with increasing certainty by the experiments on animals.

In the second part of the work, Sidis discusses theoretically the results of the experiments recorded. He first defines the "threshold" of stimulation as "the minimal intensity below which stimulus remains ineffective;" in other words, the point at which reaction to stimulus first becomes perceptible. He then shows that the threshold rises under stimulation—i. e., that an increasingly greater stimulus is required to evoke a perceptible reaction, in proportion as a series of stimulations is kept up without variation. Finally, the stimuli fall altogether out of consciousness and fail to awaken the psychophysiologic systems which previously responded to them; then, so far as the particular stimulus is concerned, the cell may be regarded as asleep. What is true of the cell holds good also of systems of cells and neurons constituting a multicellular organism. Thus, sleep is produced by monotony.

The limitation of voluntary movements also plays an important part in the induction of sleep states. Throughout the scale of animal life, from the lowest to the highest forms, intelligence is intimately related to the degree of development of the muscular system and to the delicacy of motor adjustments. Experiments prove the same truth of the importance of motor elements in our mental life. It becomes much easier to memorize a series of syllables or numbers if we write them down, even though we do not look at them during the writing. Motor elements form the nucleus of consciousness. Sidis thus describes the difference between sleep and hypnosis: "The process of redistribution of thresholds takes place in the intermediary hypnoidal states. When the redistribution of thresholds in the hypnoidal states brings about a fall of thresholds, due to predisposition to, and further cultivation of, dissociations, the result is hypnosis; when the redistribution in the hypnoidal states brings about a rise of thresholds, the result is sleep."

The experimental evidence is particularly interesting. One point that seems to call for notice is the evidence, in the case of the experiments on puppies, that there is a true personal influence exercised by the operator, though this is in every way inferior to the factors of monotony and limitation of movement and consciousness.

The essay presents occasional lapses of grammar and of logical consecutiveness, and would bear revision in this respect; for these—as well as the discursive style adopted, which leads to much unnecessary repetition—inject some difficulties into the smooth reading of a very interesting study.

SELF-CONTROL AND HOW TO SECURE IT. By Dr. Paul Dubois, Professor of Neuropathology in the University of Berne. Cloth. Pp. 337. Authorized Translation by Harry Hutchesson Boyd. Price, \$1.50. New York: Funk & Wagnalls Co., 1909.

Prof. Paul Dubois seems to have desired to make his clerical followers, or we might perhaps better say, those who have adapted his teachings to such movements as Emmanuelism, understand more fully his position in regard to fundamental morality by writing this work. It contains a large amount of good moral teaching, but the author never lets us forget his unorthodoxy, and he intrudes his idea of what he calls moral determinism all through the work. This marked intrusion of his agnosticism in this volume appears to us a defect. It does not follow that the book may not be profitable reading. It is well written and full of good counsel and in some parts it is altogether excellent. He is a tolerant agnostic and, to a comparatively harmless extent, one of the kind mentioned by Sir Thomas Browne in his "*Religio Medici*"—one of those sceptics who, while professing to know nothing, think that they know more than all the world besides. The book is meant for the laity, but it will be profitable reading for the physician. The translation is admirably done.

A MANUAL OF PRACTICAL X-RAY WORK. By David Arthur, M.D., D. P. H., Medical Officer in Charge of X-Ray Department, West London Hospital, and John Muir, M.B., Ch.B., and B.Sc. (Pub. Health.) Cloth. Pp. 244, with illustrations. Price, \$2.50. New York: Rehnman Co., 1909.

This work is offered as a practical hand-book of *x-ray* medical work and is written apparently with especial reference to the British public medical services. Its authors are well equipped for the task they have set themselves, write from first-hand knowledge of diagnostic *x-ray* work and are conservative. The work, therefore, as far as it goes, is good and is to be commended. Two hundred and twenty pages are given to the physics of *x-rays*, apparatus, and the diagnostic application of *x-rays*, and this part of the work is fairly complete. It is notable for clearness, sanity and conservatism. One chapter of seventeen pages is devoted to therapeutics. It is as sketchy as possible; contains little more than an enumeration of the affections that may be treated with *x-rays*, and is worthless. This chapter ought to have been omitted from the book. Then the work would have pretended to be no more than it is—a practical manual of *x-ray* diagnosis—and as such would have been open to no serious criticism.

CATHOLIC CHURCHMEN IN SCIENCE. Second Series. By James J. Walsh, M.D., Ph.D., LL.D., Dean and Professor of the History of Medicine at Fordham University School of Medicine. Cloth. Pp. 228, with illustrations. Price, \$1 net. Philadelphia: American Ecclesiastical Review, The Dolphin Press, 1909.

We are glad to see a second volume on the great contributors to science who were Catholic clergymen, following the one we noted some time ago. The historical side of medicine needs to receive more attention, and Dr. Walsh's contribution will help to make more clear the work done by some of the great founders in science. The books of this series have as an underlying motive an argument for the compatibility of science and faith. From the lives outlined in these chapters, Walsh remarks, it can readily be seen that most men may be devout believers in all the mysteries of religion, without having curtailed in any wise the powers for the searching investigations and inquiries that are so important for progress in science. The divisions of this second volume are: "Albertus Magnus, Philosopher, Theologian, Scientist;" "John XXI, Philosopher, Physician, Pope;" "Guy de Chauliac, Father of Modern Surgery;" Regiomontanus, Astronomer and Bishop;" "Clement Bionardi in Electricity;" "The Jesuit Astronomers."

GENERAL INDEX

All reading matter in THE JOURNAL from July to December, 1908, inclusive, is indexed here (For Current Medical Literature Index see pages 2183 to 2220). "Deaths," "Book Notices" and "Society Proceedings" are indexed under these titles at the ends of the letters "D," "B" and "S." Matter pertaining to the Association is under "American Medical Association." With the above exceptions, all matter is indexed under the most important word of the heading that was used in THE JOURNAL, and also under the subject heading. For instance, abscess of brain will be found indexed under "abscess" as well as under "brain." Such titles as "ocular manifestations, etc.," have been indexed under "eye." Cross references have been made wherever this was possible. It is also well to remember that, in looking up a certain subject, related words should be consulted, for example, testes, testicle; skull, cranium; bowel, intestines. The letters used to explain in which department the matter indexed appeared are as follows: "E" editorial, "O" original article; "C" correspondence; and "ab" denotes an abstract of an article that has appeared in full elsewhere. Names of authors of original articles appearing in THE JOURNAL are not given in this index, but are included in the Index of Authors.

A

Abdomen, reasons for examining and removing appendix before closing, 1612-ab
rectum and bladder, operative and diagnostic direct illumination of, 807-ab
upper, mistakes in diagnosis in, 414-ab
Abdominal affections, diagnosis of, 671-ab

Splenectomy and recovery in gunshot
wound of chest and spleen, 796—ab
following trauma, study of blood
after, 1231—O
splenomegaly cured by, 243—ab, 808
—ab
Splenomegaly cured by splenectomy,
243—ab, 808—ab
malarial, diagnosis of, 743—ab
tuberculous, primary, 2030—ab
Splint, barrel-hoop, for fracture of
clavicle, 467—O
Splintage, direct and internal, treat-
ment of fractures of olecranon by,
666—ab
Splints, light iron, and plaster-of-
Paris combined, treatment of frac-
ture of shaft of femur by, 1141—ab
Spondylitis, tuberculous, operative
treatment of paraplegia in, 1215—ab
Sporothrix (?) isolated from two
horses with epizootic lymphangitis,
1453—ab
Sporotrichosis of bones and joints, 1799
—ab
Sputum box, sample, 1031—O
determination of tubercle bacilli in,
after method of Pfeiffer and
Kitasato, 1597
reports, method for increasing diag-
nostic value of, 294—O
Stain, differential, for tubercle bacilli,
1894—ab
for blood smears, 1492—O
Martin, for tubercle bacilli, 1944
Stains, port wine, 1481—ab
Standardization of disinfectants, prin-
ciples involved in, and influence
of organic matter on germicidal
value, 667—ab
Staphylococcus and pneumococcus en-
docarditis, immunologic and ex-
perimental studies on, 1542—ab
infection, leucocyte extract in, 1953
—ab
infections, vaccine therapy, 1371—ab
sepsis, inflammation in testicle in,
1893—ab
Starch in digestion, diastase in, 231
in urine, 800—ab
Starvation, lime, rachitis from, 1891—ab
State-board, power of, to revoke med-
ical certificate, and right to practice med-
icine—constitutional requirements
as to notice, 163—ab
not required to recognize licenses
of, in other states, 2123

phylis, etiological therapy of, 79-ab
 fistula cure for, 51-ab
 eneral, with primary manifestations and pre fecund menses in medical men 149-ab
 hyperplasia of bone due to, 66-ab
 hypodermic injections of calomel in 62
 in hand of patient and professional secrecy, 257-ab
 industrial, 595-ab
 inherited hemiplegia from cerebral arteritis in, 1419-ab
 inherited, prognosis in, 1631-ab
 intramuscular injections in treatment of, 580-ab, 1560-ab
 is mercury a specific in infectious and contagious diseases as well as in 549-ab
 lesions in breast due to, 807-ab
 leucoderma due to, and pigmented syphilide, 512-ab
 mercury oxygemid internally in, 1463-ab
 modern treatment of, 705-ab
 multiple sclerosis due to, 991-ab, 1293-ab
 of nervous system, 1801-ab
 of nervous system, pathology of, in light of modern research, 995-ab, 1066-ab
 or nervous system, treatment of, 970-ab
 of stomach, 1159-O
 of stomach and liver, 1000-ab
 of upper air passages, 1333-ab
 postreceptional, serodiagnosis in, 1272-ab
 practical value of demonstration of spirocheta pallida in early diagnosis is of 21-ab
 pre Columbus in America, 703-ab
 reinfection with, 60
 serodiagnosis of, 169-ab, 259-ab, 497-ab 511-ab 585-ab, 638-E, 1113-F 1114-ab, 1186-F, 1193, 1211-ab 1216-ab, 1291-ab, 1453-ab, 1622-ab, 1623-ab, 1698-ab, 1931-ab
 serodiagnosis of, during years immediately following infection, 1072-ab
 serodiagnosis of, importance of, for treatment, 1467-ab
 serodiagnostics of in cadaver 219-ab
 serodiagnosis of, in obstetrics, 673-ab
 serodiagnostics of, in pregnant women and new born infants 1063-ab
 serodiagnostics of, in surgery, 1073-ab
 serodiagnostics of, influence of injections of lecithin on, 954-ab
 serodiagnostics of, influence of treatment on, 2029-ab
 serodiagnostics of, principles and modifications of technic of, 1659-ab
 serodiagnostics of, simplification of, 81-ab 1300-ab, 1391-ab
 serodiagnosis of, syphilitic rabbit corner is antigen for, 1220-ab
 sero reaction in, specific treatment on effect of, 1729-ab
 specific chemical prevention and treatment of, in macacus rhesus, 1433-ab
 surgery of, 623-O
 therapeutics of, 493-ab
 treatment of, by mercurial inhalations in hot room 1782-ab
 treatment of, on basis of latest research 260-ab
 Wassermann reaction as diagnostic aid in, present status of, 638-E
 Syphilitic stigma of importance to general practitioner, 17-ab
 Syphilology research work in, advances in, 2018-ab
 Syringomyelia, successful x-ray treatment of, 1803-ab

recent, eighteenth report on, 914-ab
Teratomas, solid ovarian, 1283-ab
Test: See also Reaction
agglutination, and method for hemolysis, 1886-ab
aloïn or guaiac, for blood depends solely on iron contained in its hemoglobin, 799-ab
antitryptic ferment, 336-ab
breakfast, fat-zwieback, for estimation of motor functioning of stomach, 1073-ab
for bile in gastric contents, 1758-O
for blood in urine, 2121-ab
Hainés' for glycosuria, 1198
Heller's for albumin, different rings obtained with, 1886-ab
Heller's, for urinary protein, thymol as source of error in, 1310-O
hemolytic, for malignant tumors, 328-ab
specific-gravity, for identification of criminals, 699-ab
tube, paroxysmal hemoglobinuria and hemolysis in, 1370-ab
Testamentary capacity, and insanity, 1954
Testicle, 1929
atrophy of, 1793-ab, 2026-ab
syncytioma malignum of, with functional hyperplasia of mamma, 1276-ab
Testicles, inflammation in, in staphylococcus sepsis, 1893-ab
undescended, 738-ab
Testimonials, how they are secured, 1194
Tests and declarations to physicians, 799-ab
chemical, in diagnosis of general paralysis and tabes dorsalis, 1891-ab
Tests, differential, diagnosis and afforded by, in surgical diagnosis, 2126-ab
quantitative, for albumin, 174-ab
Tetanus, acute traumatic, magnesium sulphate in, 990-ab, 1541-ab
after surgical operations, 1626-ab
subarachnoid injections of magnesium sulphate in, 418-ab
treatment of, 322-ab, 1890-ab
Tetany, and calcium metabolism, 388-ab
gastric, operation and recovery, 249-ab, 329-ab
relation of, to parathyroids and to calcium metabolism, 509-ab
treated by calcium salts, 1102-O
Texas, consumptives unwelcome in, 1118
medical news, 307, 483, 1268, 1769, 1846
state board November report, 503
Thyobromin in angina pectoris, 1151-ab
Theory of complex, 1543-ab
Therapeutic progress, 519-O
Therapeutics and pharmacodynamics, modern teaching of, 1299-ab
disruptive high-frequency discharges by reaction method as important agent in, 591-ab
dry inhalation in, 426-ab
hypodermic medication in, 1867-ab
importance of adsorption for, 259-ab
practical, modern dermatologic pathology as related to, 170-ab
suggestive, 509-ab
x-ray in, 324-ab
Therapy, present day, 1622-ab
Thermic crises in tubes, 1717-ab
Theses, university in library of College of Physicians, 2115-C
Thorax, clinical index of, pulmonary tuberculosis, 1916-O
lesions of, value of x-ray in, 1714-ab
operations under differential pressure, new apparatus for, 932
transfusion, 1889-ab
Thoughts and emotions, influence of, in causation of disease, 2125-ab
Throat, access through, to sphenoidal sinus and sphenoidal segment of base of brain, 1730-ab
and nose, chronic infections of, systemic effects of, 1206-ab
examination in infants, 1230-ab
nose and ear diseases, bismuth paste in, 117-O, 159-ab
streptococcus infections of, 1751-O
tumors in, new mode of access to, 518-ab
Thromboangiitis obliterans, veins in, 1319-O
Thrombophlebitis of superficial veins, acromegaly with, 799-ab
Thrombosis and allowing patients to get up early after childbirth, 601-ab
and embolism after operations on female pelvic organs, 595-ab
and embolism, prophylaxis of, 668-ab
and pulmonary embolism after laparotomy, 999-ab
frequency of, after gynecologic operations and childbirth, 601-ab
inflammatory, of peripheral venous system, 1073-ab
of brachial artery, operative treatment of, 1464-ab
primary portal, 1716-ab
Thrombus, successful removal of, from inferior thyroid veins, 1632-ab
Thumb or finger, lost, and palm, plastic substitute for, 2030-ab
Thymol as source of error in Heller's test for urinary protein, 1310-O
Thymus and nervous system, 425-ab
enlargement with nervous symptoms, 991-ab
gland, 1929
Thyroid, aberrant, 663-ab
anomalies and ichthyosis, 1069-ab
congestion, and goiter in new-born infant, 1798-ab
enlarged, in domestic animals, 1729-ab
epidemic of cancer of, in brook trout in fish hatchery, 411-ab
origin of rheumatism, 792-ab
pathologic changes in, and varying symptoms in exophthalmic goiter, 419-ab
preparations, relation of iodine to, activity of, 1260-E
spine, 232-ab
surgery of, 1350-ab
tissue, implantation of, in three cretins, 1150-ab
tissue, transplantation of, in various organs, 1071-ab
transplantation of, 1371-ab
treatment of lipomatosis, 1348-ab
Thyroidectomy for dementia præcox, 2020-ab
partial, 2025-ab
Thyroidism, treatment of, by specific cytotoxic serum, 248-ab
Tic and chorea, 1373-O
Tic-douloureux, alcohol injections in, 1867-ab
medicinal treatment of, 1886-ab
Tinea cruris, 2105
tonsursans, 2105
Tissue antiseptics and animal infection, 1124-ab
Tissues, regenerating, reactions of, on animal body, 409-ab
Titles, unlawful use of, by osteopathic and magnet physicians and drugless doctors, 588
Tobacco, 1495
amblyopia, from cigars, in woman, 1292-ab
smoke, pharmacology of, 386-E
use of, in Austria, 903
Toil, respite from, for pregnant work-women, 487
Tongue, carcinoma of, operations for, 421-ab
mouth and jaw, cancer of, results of operations for, at Massachusetts general hospital, 1890, 1904, 1715-ab
philosophic anatomy of, 1397-O
Tonsil, finger enucleation of, 250-ab, 1055-ab
functional relation of, to teeth, 1885-ab
seizing forceps, 1834-O
snare, improved, 556-O
Tonsillectomy, 547-O, 1958-ab
Tonsils, degenerate, and middle ear deafness, 592-ab
faucial, and teeth, 1988-O
faucial, procedure for complete excision, 547-O
malignant tumors of, 1362-ab
Tooth movement and bone pathology, 1023-O
Torsion of omentum and incarceration of hernia, 1467-ab
Toxemia, acute, after chloroform anesthesia, 1623-ab
of pregnancy, 472-ab, 735-ab, 1793-ab
of pregnancy, renal insufficiency, 802-ab
of pregnancy and eclampsia, comparison of lesions found postmortem in, cases diagnosed clinically as, 1888-ab
pre-eclamptic, diagnosis of, blood pressure, leucocyte count and ophthalmoscopic examination in, 1143-ab
Toxicity, ionic potential factor in, 1124-ab
Toxin, diphtheria, and antitoxin, 517-ab
diphtheria, and antitoxin, neutral mixtures of, active immunity produced by, 1144-ab
Toxins and so-called antitoxins, 77-E as active causes of inebriety, 1532-ab
Trachea, râles from vibration of, 2121-ab
Trachoma and emigrants at Paris, and public weal, 1063-ab
cause of, 1345
fight against in Austria, 2114
germ causing, 1466-ab
new surgery of, 1864-ab
spread of, in Ohio, economic importance of, 1295-ab
Traction and compression, new modes of application of, in medico-mechanical devices, 1369-ab
in hip disease, 418-ab
Train, duty when passenger becomes insane on, 1539-ab
Transfusion, avoidance of hemolysis in, 1206-ab
blood, direct, and plastic surgery of blood vessels, 442-ab
blood, direct, clamp designed for, 412-ab
blood, direct, for gastric hemorrhage, 411-ab
blood, without cannula, simple method of, 297-O
Transportation of disabled, steel frame in, 1065-ab
Transplantation of uterus and bearing of results obtained on problems of tumor growth, 408-ab
Transudate, peritoneal, formation of, 1454-ab
Trauma and surgery of spleen, 1143-ab
chronic, and internal cancer, 635-E
electric, 1003-ab
influence of, on heart, 1072-ab
local, and constitutional conditions, 999-ab
mental defect originating from, 1104-O
of skull and injury of brain, 1552-ab

- Tuberculous pleurisy, CURRENT MEDICAL LITERATURE

INDEX OF SUBJECTS

Explanation: The reading matter which appeared in THE JOURNAL is not indexed here, except the original articles and the abstracts of original articles. This index refers to the titles and the subjects of original articles published in the leading medical journals of the world, including THE JOURNAL, during the past six months. The titles of the articles and the names of the journals in which they appeared were listed weekly in the Current Medical Literature Department, and it is to them that references are here made. The figure in parenthesis refers to the paragraph; the number following, to the page in THE JOURNAL. For instance, "Abdominal Surgery in the Aged, (48) 923," refers to page 923 of THE JOURNAL, on which is found, in paragraph numbered 48, the title of the paper and the name of the author, viz., "Abdominal Surgery in the Aged. E. W. Hedges." This title is listed under the journal in which the article appeared, the *American Journal of Obstetrics and Diseases of Women and Children*, February, 1909. When "ab" follows a page number it indicates that the article was abstracted in THE JOURNAL; for instance, "Aberrations, Psychic, With Diseased Prostate, (45) 167-ab." On page 167, paragraph 45, will be found an abstract of this article, which appeared in the *Illinois Medical Journal*, November, 1908. Titles of articles which appeared originally in THE JOURNAL are indicated in the index by an asterisk (*) before the page number; for instance, "Abdominal Tuberculosis, Acute Forms of, *291," refers to page 291 of THE JOURNAL, on which is found the complete original article. The index to authors of all articles, both original and those listed under Current Medical Literature, appears separately on pages 2221 to 2236 of this index.

A

- Abdomen and lungs, anthracosis of, origin of, rôle of intestinal tract in, (134) 1729
 contusion of, with rupture of wall and total transverse section of intestine, (119) 1071

 Ameliasis, symptomatology, diagnosis and sequelae, and use of formalin and copper phenol sulphate in treatment, (172) 1064
 Ameboid movement, combination of substances which excites, in leucocytes, by which living can be differentiated from dead cells, (14) 593
 Amenorrhea, hitherto undescribed, variety of, and its operative treatment, (94) 1370
 Aments, criminal responsibility of, (27) 2026
 America, reminiscences of, (3) 416
 American civilization, elements of decay in, (76) 231-ab
 Medical Association, appropriate insignia for, *1325
 Aminoacids, breaking down of, in healthy and diseased organism, (92) 1070
 Ammonia and urea, determination of, comparative tests of Spiro's and Folin's methods, (185) 1034
 coefficient, metabolic research on breast-fed child, (76) 1369
 elimination of, by mouth in uremia, (95) 1551
 elimination of, following administration of glycocoll, asparagin and glycerylglycinanhydrid, (63) 923
 method of estimating, in urine, suitable for clinical purposes, (15) 1296-ab, (68) 1888-ab
 oxalate, value of, in blood culture, (151) 736-ab
 Amnesia from medicolegal standpoint, (11) 662-ab
 mechanism of, (91) 1717
 Amniotic fluid, constant leakage of, (132) 83
 lack of, and clubfoot, (84) 742
 twins with excess of, for one and lack of it for other, (58) 422
 Amniotic sac, forcible opening of, for artificial premature delivery, 441 426-ab
 premature rupture of, injection of water to restore fluid after, (103) 1216
 Ampulla of Vater, calculus at, acute and chronic pancreatitis from obstruction of duct by, (9) 2119
 Amputation aiming for functional utilization of all forces left, (66) 423-ab
 Gritti, modification of, with reference to nerve blocking and regional anesthesia, (62) 250
 interpelvi-abdominal, (10) 998
 of knee joint under local anesthesia, (39) 1206
 of uterus to preserve menstrual function, (127) 1363-ab
 partial, of foot, oligohydramnios with, occurring in uterus unicornis, (17) 1211
 Amputations, thigh, effective dressing for, (43) 590
 Amylopsin in stools, estimation of pancreatic secretion by amount of, (63) 598-ab
 Amyl nitrite, action of, on arterial system, (112) 1965-ab
 Amyloid degeneration of kidneys, (44) 1893-ab
 Amyluria, (16) 800-ab
 Amyotonia congenita, (51) 1542
 Amyotrophy, tabetic, curability of, (53) 422-ab
 Anaerobes of intestine content, biochemical study of, (46) 1068
 Anal: See also Anus
 Anal canal, embryologic and pathological significance of certain folds in, (6) 1463-ab
 Analgesia: See Anesthesia
 Analysis, introspective, of conscious life, (53) 591-ab
 urinary, of mixed urine, value of, in diseases of urinary tract, (120) 995
 Anamnesis: See History
 Anaphylaxis, (73) 174, (39) 1547, (87) 1717
 acute, share of nervous system in, phenomena of, (49) 1627-ab
 and alcohol, activation of ferment by, (92) 337
 and immunity, (11) 1289
 and serum toxicity, (90) 1630
 application of, to diagnostic purposes, (38) 172-ab
 nature of, (98) 1370-ab
 serum in, specific action of and utilization of to distinguish between human and animal blood stains, (117) 1371-ab
 Anaphylactic intoxication, localized, in children after repeated injections of antitoxin, (105) 1953-ab
 Anasarca and edema, (101) 664
 and edema in infants, (50) 1065-ab
 Anastomosis, arteriovenous, for gangrene, (61) 259
 arteriovenous, for thromboangiitis obliterans, *1310
 end-to-end, intestinal resection with, by Parker-Kerr method, recovery, *1107
 of bile ducts with jejunum, (138) 1633-ab
 of blood vessels, (144) 1624
 of nerves, experimental and histologic study of, (100) 1801-ab
 Anatomy and pathology of acute intestinal obstruction, (57) 733
 gross, of brain and spinal cord, (60) 1621
 morbid, of heart, (31) 922
 of frontal sinuses, variations in, (108) 77
 of maxillary sinus, surgical considerations of, (9) 1939
 of skull, (59) 1621
 pathologic, and clinical picture of gastric erosions, (62) 1628-ab
 pathologic, of hematogenous diffuse diseases of kidneys, (61) 1467
 philosophic, of tongue, *1397
 what is practical examination in, (44) 1060
 Ancients, superstitions and gem therapeutics of, 21 1886
 Anemia, antitrypsin test in, (104) 1216
 chloroform in, (27) 1065
 due to recurrent nasal hemorrhages, (54) 1887
 grave, new forms of, (126) 518
 in children and embryonal blood, basophilic granulation of red corpuscles in, (75) 1369
 of infancy, *455
 of uncinariasis, presence of weak hemolysin in hookworm and its relation to, (88) 1144-ab
 pernicious, (17) 1365, (24) 1891, (27) 1960-ab
 pernicious, and gastric cancer, (37) 1798-ab
 pernicious and spinal cord diseases, (80) 2030
 pernicious, appendicostomy in, *888
 pernicious, from distoma, (104) 672
 pernicious, glycerin treatment of, (152) 602-ab
 pernicious, intestinal autointoxication as causative factor, (153) 1720
 pernicious, progressive, (21) 1206, (138) 1364
 pernicious, puerperal, transfusion of blood in, (105) 1965-ab
 pernicious, transfusion of blood for, (10) 991
 pernicious, treatment of, (51) 514, (9) 666
 splenic, (44) 417
 splenic, in five-year-old boy, *963
 splenic, infantile, (39) 643, (18) 666
 splenic infectious, endemic focus of febrile variety of, in children, (94) 808-ab
 supply of oxygen in, (92) 423
 surgical, and resuscitation, (27) 1460-ab
 total temporary, of central nervous system, histologic changes in nerve cells due to, (83) 1144
 Anemias, secondary, (125) 1958
 Anesthesia, (117) 77, (125) 252, (99) 995, (99) 1293, (77) 1957
 and suggestion, (112) 169-ab
 by magnesium sulphate, possibly due to asphyxia, (121) 420-ab
 causes of death during, (15) 333-ab
 chloroform, (39) 1892
 chloroform, acute toxemia after, (112) 1623-ab
 chloroform, causes inducing functional disturbances in circulation and respiration during, (147) 85-ab
 chloroform, necrosis of liver after, *1488
 cocaine spinal, (149) 1220
 considered as specialty, (91) 1062
 dilatation of stomach, acute, in, *1996
 during childbirth, (104) 337-ab
 ether, administration of, (76) 1061
 ether, and Long, (89) 168-ab
 ether, buttercloth method of, (49) 1723
 ether, by rectum, (58) 515-ab (102) 1371-ab
 ether-gas, (94) 1208
 general, (185) 998
 general and spinal, action of, on kidneys and urine, (45) 805-ab
 general, ethyl chlorid in, (17) 922
 general, radical anorectal surgery without, (151) 594
 general, with part of circulation shut off, (114) 84-ab
 Anesthesia, hypodermic, (79) 1203
 importance of shape of zones of, (89) 1550
 improvements in, (55) 2024-ab
 in field, (119) 1145
 local, addition of suprarenal preparations to, (59) 806
 local, and causation of idiopathic paralysis and dilatation of bladder, (30) 1723
 local, amputation of knee joint under, (39) 1206
 local, for inguinal hernia, (58) 1800
 local, in dilatations of, and operation on, the cervix uteri, (143) 1730-ab
 local, in extirpation of goiter, (100) 1371
 local, in hands of general practitioners, (85) 336-ab
 local, in major abdominal surgery, (2) 72
 local in minor surgery, (28) 2026
 major, economy in, especially with ethyl chlorid, (11) 1885
 new method of administering ether for, (8) 72
 nitrous-oxid, (104) 1203
 of teeth, (56) 597
 physiologic, during labor, (32) 334-ab
 prophylaxis in acidosis following, (14) 78-ab
 rectal, (68) 1957-ab
 rectal, apparatus for, (27) 732
 regional, and nerve blocking, in modification of Gritti amputation, (62) 250
 regional, in transplantation of skin, (131) 932
 sacral, (140) 691-ab
 scopolamin combination, (122) 425-ab
 scopolamin-chloroform-ether, (108) 1071
 scopolamin-morphin-ether, (111) 1631-ab
 scopolamin-morphin, in gynecology, (45) 173-ab
 spinal, (104) 424, (46) 667, (146) 674-ab, (116, 117) 1217-ab, (83) 1301-ab
 spinal, acute decubitus following, (114) 1897-ab
 spinal, and scopolamin, (111) 259-ab
 spinal and their application to, of mechanics of cerebrospinal fluid, (98) 83-ab
 spinal, at Upsala, (148) 674
 spinal, improved technic for, (90) 1964
 spinal, in genitourinary and rectal surgery, (132) 925-ab
 spinal, indications for, in abdominal operations, (79) 670-ab
 spinal, technic of, (127) 1633
 spinal, with novocain in gynecology, (82) 1301-ab
 unilateral, in tabes dorsalis, (12) 1211
 vein, (42) 1466-ab
 vomiting of, (33) 1366
 with known percentages of chloroform, (13) 803
 Anesthesias, senile, (81) 516
 Anesthetic, atropin sulphate as in preparing birds for surgical experiments, *382
 choice of, (52, 53) 1716
 ethyl chlorid as general, (33) 1620, (15) 1885-ab
 somnoform as, (111) 1623
 Anesthetics, administration of, (48) 667, (5) 1955-ab, (56) 2024-ab
 administration of, advisability of making it required part of medical course, (57) 2024-ab
 finer points of ether therapy as applied in, (124) 1958
 local, recommended as substitutes for cocain, (11) 1365
 recent work on, (28) 999
 Anesthetist, surgeon and patient, (13) 731
 trained or untrained, (58) 2024-ab
 Anesthetization, intravenous, (98) 257
 of eye and its appendages, (109) 83
 of tympanum, (131) 1552
 Aneurism, (18) 1212
 aortic and tabes dorsalis, (9) 1714-ab
 aortic, bronchoesophagoscopy in diagnosis of, (36) 1798-ab
 aortic, diagnosis and etiology of, (59) 80-ab
 aortic, extrathoracic simulated by pulsating cancer of sternum and ribs, (51) 1548
 aortic, perforation of, into superior vena cava, (160) 427
 aortic, recurring, (124) 518
 aortic simulating hypertrophy of heart, (50) 1543
 Aneurism, arteriovenous, of profunda femoris, operation by Matas method, (127) 925
 dissecting, (76) 664
 false, of femoral artery, following typhoid, (90) 1292
 femoral, atypical Matas operation for, (40) 1290
 of anterior cerebral artery, (15) 73
 of hepatic artery, (69) 1214, (45) 1367-ab
 popliteal, (20) 1365-ab
 pulsating, jerky expiration from, (71) 1895-ab
 removal of, at knee, circular suture of blood vessels after, (118) 423-ab
 thoracic, (3) 921
 thoracic, spontaneous cure of, (10) 1463
 traumatic, and arterial varix, (63) 1542
 Aneurisms, at base of neck, treatment of, by simultaneous ligation of right common carotid and subclavian arteries, (64) 1069-ab
 large, non-expansile, transmitted, pulsation of, (26) 1460
 on limbs, treatment of, (41) 2027-ab
 rupture of, fatal hemoptysis from, in non-tuberculous bronchiectasis, (48) 740
 thoracic, symptoms of, (35) 1892-ab
 Angina, Ludwig's, treatment of, (71) 335
 pectoris and overfeeding, (9) 1140-ab
 pectoris or asthma, should Seneca's illness be regarded as, (110) 1965
 pectoris, painless and painful, *1744
 pectoris, theobromin in, (94) 1151-ab
 pneumococcus, endemic occurrence of, (69) 806
 Vincent's, (14) 512, *962, (84) 1937
 Angiolipoma, (27) 1147
 Angioma, diffuse cavernous, of upper extremity complicated by tuberculosis and pulmonary hemorrhage, (110) 1144
 of atrium of Hlighmore, (25) 1050
 of face or elephantiasis mollis angiectodes, (106) 1216
 of spleen, (110) 518, (53) 1548
 successful treatment of, with carbon dioxide snow, (136) 601
 Angiomata of face and sinuses, (25) 1039
 Angioneuroses and trophoneuroses of extremities, (15) 999
 two important, (11) 248-ab
 Angiosclerosis, retinal, beginning signs of, (43) 693-ab, (136) 665-ab
 Angiorrhaphy, (61) 1207
 Animal body, action of powerful electric current on, (26) 171-ab, (75) 1150-ab
 breeding, experiences of, light thrown on eugenics by, (85) 1632-ab
 experiment and clinical observation, suggested treatment of leukemia based on, (137) 1719-ab
 experimentation, hyperchlorhydria and its treatment based on, (83) 1208-ab
 experimentation with tuberculin reactions, (17) 72-ab
 rabid, hazard attendant on association with, (24) 731
 Animals and fowls, curvature of spine in, (81) 1630-ab
 and man, rabies in, (113) 1623
 and man, tumor-like formations of fat in, (3) 1365
 cold-blooded, serums from, and solutions of hematoxins, reactivation of hemolytic immune serum by, (150) 1073
 higher, intestinal emulsion in, (57) 1723
 immunization of, papain in, (39) 2026
 infections in, curative influence of extracts of leucocytes on, (33) 166-ab
 nephrectomized, and nephritis, mydratric action of serum and urine in, (61) 668
 nutrition of, inorganic phosphorus in, (60) 923-ab
 Ankle, arthrodesis of, (97) 1896
 capsule, primary sarcoma of, (82) 1629
 gymnastic exercise of, (48) 422
 Ankyloses, ossicular, tests for diagnosis of, and instrument for their production (72) 1461
 Ankylosis of knee, (199) 1065-ab
 treatment of, with Bier and Tynauer apparatus, (105) 1723
 Ankylostoma duodenale, *1622
 Ankylostomiasis and beriberi in Cochinchina, (42) 422, (28) 738-ab
 in Mexico and its diagnosis, *1255
 nervous syndrome complicating, (119) 1966-ab

- Ankylostomiasis, salt in prophylaxis of, (10) 173—ab
- Anomalous, in soft parts of obstetric operations, for, (21) 2121
- Anorexia, (13) 914—ab
- Antepartum vaginal examination, importance of, (77) 1555
- Anthracosis, lung, experimental, *122 of lungs and abdomen, origin of, role of intestinal tract in, (14) 1729
- Antitox diagnosis complement fixation in, (111) 1371
- local injection of carbolic acid in, (74) 173
- prevention of, (14) 260—ab
- serotherapy of, (117) 425—ab
- Anthropology, medical importance of study of, (1) 1884—ab
- Antibodies and opsonins, (49) 1587—ab in milk, (30) 173
- of tryptic ferments, clinical importance, (88) 771
- opening up new sources for production of, (123) 600—ab
- opsonins distant from, (150) 998—ab
- production of, importance of higher temperature for, (96) 1531—ab
- specific in serum in streptococcus lesions, (43) 1901
- Antibody, complement fixation by, in blood of tuberculous patients, (58) 255
- Antiferment and ferment treatment of suppurative processes, (79) 516—ab
- content of blood, influence of physical measures on, (66) 1030
- Antiferments, bacteria, and bactericidals, (81) 1904
- Antiformin, differentiation of tubercle bacilli by, (79) 1726
- Antigen, amboceptor, and complement, quantitative relations of, in estimation of hemolysis, (101) 1938
- production of, for serodiagnostics of syphilis, (106) 1302
- syphilitic rabbit corneas, for serodiagnostics of syphilis, (146) 1220—ab
- Antigens determination of, in complement fixation in tuberculosis, (97) 671
- Antigonococcus See Gonococcus
- Antimalaria See Malaria
- Antimeningitis See Meningitis
- Antipyrates, action of, on phagocytosis, (166) 427
- Antisepsis of abortion, (34) 1213
- Antiseptics in minor surgery, (20) 1340
- mercury combinations used as, comparative irritative proportions of, (30) 508—ab
- Antispasmodics and cure of spasms, (11) 1891
- Antitoxin, and diphtheria toxin, (94) 317—ab
- and diphtheria toxin, balanced or neutral mixtures of, active immunity produced by, (82) 1144—ab
- causes of failure of, (68) 1467
- diphtheria and asthma, (39) 1360—ab
- diphtheria, have recently reported deaths from, been satisfactorily explained? (148) 511
- diphtheria, in postdiphtheritic paralysis, (40) 1660
- diphtheria in whooping cough, (29) 1206
- diphtheria, injection of, followed by dyspnea and urticaria, *1181
- diphtheria, plea for free distribution of, in Colorado, (118) 510
- diphtheria, prophylactic effect of, on child in utero, *306
- diphtheria, value of preventive injections of, (119) 1371—ab
- infection by, (27) 1850
- or serotherapy in whooping cough, measles and scarlet fever, (35) 1206
- repeated injection of followed by localized anaphylactic intoxication in children, (100) 1938—ab
- Antitoxins, oral administration of, (178) 988—ab
- Antitypsin, origin and importance of, especially in cancer, (110) 1001
- Antituberculosis See Tuberculosis
- Antityphoid See Typhoid
- Antrum, maxillary, trephining and curetting through nose, (43) 1000
- maxillary, angioma of, (20) 1039
- Anuria, calculeous, (30) 1460
- pathogenesis and treatment of, (32) 1800—ab
- with necrosis or renal convoluted tubules, (10) 1067
- Anus and anal canal, chancroidal processes at, (41) 1901—ab
- artificial, formation of, (34) 513—ab
- imperfect, (9) 1781, (15) 1962—ab
- or rectum, imperfect, remote results of operative treatment of, (43) 334—ab
- surgey of, without general anesthesia, (151) 111
- Aorta and other large arteries in dog, partial progressive and complete occlusion of, by metal band, (90) 1144
- aneurism of, and tabes dorsalis, (9) 1714—ab
- aneurism of, broncho-esophagostomy in diagnosis of, (1) 1785—ab
- aneurism of, diagnosis and etiology of, (1) 80—ab
- aneurism of, extrathoracic simulated by pulsating cancer of sternum and ribs, (31) 1348
- aneurism of, perforation of, into superior vena cava, (100) 427
- aneurism of, recurring, (124) 538
- aneurism of, simulating hypertrophy of heart, (50) 1518
- complete obliteration of, at mouth of Botall's duct, (97) 1070—ab
- aortic insufficiency and syphilis, (68) 255—ab
- incompetency, relative, of muscular origin, (90) 1889—ab
- insufficiency, axillary distolic murmur in, (42) 329—ab
- regurgitation retardation of pulse wave in, (1) 202
- Aortitis, syphilitic, treponema pallidum in, (2) 1619—ab
- Apex, right, anatomic explanation of greater amount of vocal fremitus and vocal resonance normally found at, (140) 1063—ab
- simple non tuberculous induration of, from mouth breathing, (73) 1963—ab
- Aphasia, (24) 928—ab
- auditory and motor, with reeducation, (78) 734
- complete transient, homotropin poisoning with, (105) 1623
- traumatic, with right hemiplegia in left handed boy, (81) 1214
- Aphonia, mental change and other symptoms, with flaccid paralysis of muscles which support head in tumor of frontal subcortex and callosum, with necropsy, (78) 1792
- Aplasia, congenital, of biliary passages, with cirrhosis of liver, cured by operation, (52) 1298
- Apomorphin in muscular spasm, *1178
- Aponurosis, suture of, in operations for umbilical hernia, (74) 2030
- Apoplexy, cerebral, hemiplegia from, treatment of, (11) 922—ab
- delayed, (57) 330—ab
- J J Wepfer, renaissance student of, (75) 664
- tardy from standpoint of industrial insurance, (79) 1802
- Apparatus and technic used in making radiographs, (98) 1208
- automatic extension, Zuppinger's, in fracture of leg, (76) 423
- Bier and Tymaner, in ankylosis, (100) 1728
- cautery, De Forest, (93) 1958
- combined, for lumbar puncture, in injection and measurement of pressure, (103) 424
- douche pan to be used for irrigations after suprapubic cystostomy, *993
- easily improvised for saline infusion, (74) 1894
- for administering nitrous oxide and oxygen or ether vapor and air in definite mixture, *697
- for application of hyperemria in gynecology, (27) 171—ab
- for continuous enteroclysis, *1200
- for determining gastric and other acidities quantitatively, *1100
- for drainage of bladder following either suprapubic or perineal cystostomy, *1332
- for intrathoracic operations under differential pressure, (8) 327, (130) 932
- for introduction of salines into rectum, (63) 1207
- for measuring permeability of nasal passages, (70) 929
- for rectal anesthesia, (27) 732
- for relief of pain in first metatarsophalangeal joint, (77) 1202
- for studying respiratory exchange, (82) 2023
- for supporting pelvis in operations, (104) 1371
- Apparatus for suspension of fracture of femur in young children, (53) 111
- for tests of respiratory interchanges, etc., (102) 1551
- for treatment of femoral fractures, *132
- orthopedic, to prevent orthostatic albuminuria from lordosis, (87) 1151
- portable, for ozone purification of water, (130) 1729
- portable, treatment with, in modern orthopedics, (100) 1931
- suction in puerperal mastitis, (70) 1621—ab
- positive pressure, Brauer improvisation of, for experimental and clinical work, (115) 1071
- precision pipette for, bloodcount, (60) 1299
- radiologic frame, (125) 1145—ab
- steel frame for transportation of disabled, (192) 1065—ab
- to keep enteroclysis solutions hot, *1211
- to shut out sounds and to improve hearing, (72) 1629
- traction for applying spica casts and orthopedic manipulations, in fracture of thigh, (30) 113, (110) 1145
- used by Greeks and Romans in setting fractures and dislocations, (73) 734 (70) 991
- ray, with pulsating current, (89) 205
- Appendectomy after drainage of appendiceal abscess, (60) 1061—ab
- interil, phlebitis following, (158) 934—ab
- intestinal hemorrhage after, (67) 929
- Appendices epiploicae, torsion of, causes, (75) 1629
- Appendicitis, (92) 995, (24) 1068, (67) 1361—ab, (110) 1623
- abscess formation in, (21) 1290
- acute, (127) 1372, (31) 1892—ab
- acute and chronic, bacteriology of, and peritoneal effusion, (108) 599
- acute, cause of death after operation for, (6) 2025
- acute, cutaneous affection and, (116) 518
- acute, intestinal obstruction complicating, (95) 1623, (135) 1624—ab
- acute, operative interference in, (83) 602
- acute treatment of, (12) 2120
- adenitis local suppurative, with, (151) 511
- and accident insurance, *889
- and appendix, anatomic study of, (133) 932
- and right kidney and ureteral irritation coexistence of symptoms of, (93) 1793
- and tetany, (55) 250
- apparently mild cases of, (118) 1794

- Foreign body, gastrotomy for, (35)
254
giant cells, origin and development
of, (145) 736
in eye, extraction of, by scissors-
magnet, *1885
in larynx causing death, (129) 996
in left bronchus, (77) 1461
in trachea, (33) 1715
in orbit of long standing, (113) 1209
pseudotuberculosis of peritoneum,
(140) 1073—ab
removal of, from cornea, by factory
foreman, serpiginous ulcer follow-
ing, (65) 1061
unique, in male bladder, removal by
suprapubic cystotomy, (81) 1717
- Formildchyd, action of, on tubercu-
lous sputum, (63) 1800
dosage of, (97) 1302—ab
gelatin capsule, (102) 1631
poisoning, *1106
- Formalin and copper phenol sulpho-
ate, in amebiasis, (172) 1064
poisoning, *880
- Fossil, oldest, of man extant, recent
discovery of, (87) 1803—ab
- Fowls and animals, curvature of spine
in, (81) 1630—ab
- Fracture, boxer's, (32) 1464
Colles', (110) 1462, (50) 1716
Colles', treatment of deformity fol-
lowing, (205) 1065
compound, comminuted and de-
pressed of skull with laceration of
brain and rupture of middle men-
ingeal artery, (7) 333
compound, treatment of, radical con-
servatism in, (92) 1889—ab
diagnosis of, (26) 333
dislocation, typical intercarpal, (118)
1003
irreducible, of surgical neck of hu-
merus, operative treatment of,
(41) 1620
of arm, extension in ambulant treat-
ment of, (137) 1304—ab
of astragalus, (34) 590—ab
of base of skull, (155) 594
of base of skull, surgery of, (26)
1068—ab
of clavicle, (128) 1294
of clavicle, barrel hoop splint for,
*467
of clavicle, method of treating, (16)
1212—ab
of femur in new born, (18) 1625
of femur neck, abduction treatment
of, (93) 1889—ab
of femur neck, anatomic treatment
of, after method of Maxwell and
Ruth, (25) 922
of femur neck, intracapsular, opera-
tive treatment for, (202) 1065—ab
of femur neck, non operative treat-
ment of, (201) 1065—ab
of femur neck, treatment of, (5)
247, (30) 1541
of femur shaft, treatment of, by
combined plaster-of-Paris and light
non splints, (33) 1141—ab
of femur, suspension of, modifica-
tion of Bradford frame for, in
young children, (55) 663
of great tuberosity complicating dis-
location of shoulder, (108) 1890
of inner condyle in forward disloca-
tion of elbow, (48) 1627
of leg, comminuted, wire central
circling in, (65) 929—ab
of leg, torsion, fragments in, typical
dislocation of, (60) 515
of malleolus, (80) 1550—ab
of metacarpal bones, spiral, (83)
1550
- Fracture of os magnum, (65) 250
of patella, bilateral ununited, with
good functional results, (6) 1539
of patella, old, with wide gap, op-
erative treatment of, (167) 428
of patella; results of treatment by
suture, (103) 169—ab
of pelvis and rupture of kidney, re-
covery from, *1401
of pelvis in high forceps delivery,
*381
of skull and wounds of abdomen, and
major emergency operations, (104)
1889
of spine, formation of calculi in
urinary passages after, (68) 1149
of tibia, in talocrural joint, (68)
598
prognosis in, (21) 999—ab
simple, *1005
simple, diagnosis and operative
treatment of, (90) 1889—ab
sprain, and sprains, (25) 248
supracondylar, of upper arm, treat-
ment of, (66) 1368
- Fractures and their legal status, (141)
1063
automobile, (69) 734—ab
buried prosthesis in, (42) 1961—ab
care of, in general practice, (11) 588
compound, treatment of, (84) 251,
(27) 389, (111) 1462
extension by transverse nail in,
(116) 672—ab
extension treatment of, (87) 1070
first aid in, (86) 802
immediate operative treatment of,
(24) 992—ab, (154) 1295—ab
isolated, of transverse processes of
lumbar spine, (98) 599
molded plaster-of-Paris splints in,
(23) 1790
obscure, discovered by x-ray, (22)
328, (19) 2022
of base of skull, treatment of, (1)
332
of elbow joint, (166) 1061—ab
of extremities, nerve involvement
in, (134) 1210—ab
of femoral neck, (167) 1064
of femur, ambulatory treatment of,
(116) 1145
of femur, ideal arrangement for
treatment of, *1332
of femur, portable traction appar-
atus for treating, (56) 663
of leg, (153) 1295
of leg bones, malunion of, (20) 170
of leg, delayed union, non-union,
and vicious union in, and Volk-
mann step operation, (128) 1145
of leg, results of treatment of, with
Zuppinger's automatic extension
apparatus, (76) 423
of olecranon, their treatment by di-
rect and internal splintage, (14)
666—ab
of patella, old, treatment of, (102)
257—ab
of skull, (47) 417, (65) 1061—ab,
(66) 1621, (79) 1620
of skull, compound, (107) 83
of thigh: See of Femur
old, operation in, (156) 1720
open treatment of, (168) 1064
repair of, (6) 588
setting of, apparatus used by
Greeks and Romans in, (73) 734,
(75) 994
simple, operative treatment of, (22)
1621—ab
splint to remodel arch of foot after,
(128) 425
symptoms and diagnosis, (87) 802
treated at Berlin polyclinic, (80)
1214
treatment of, *857, (67) 1467—ab,
(91) 1889
x-ray in diagnosis and treatment
of, (22) 328, (88) 802, (144) 996—
ab
x-ray plates of, exhibit of, (12) 588
- Frame, radiologic, (125) 1145—ab
- France, prophylaxis of infant mortal-
ity in, (34) 1297
- Freezing point of water, depression
of, due to dissolved caseinates,
(57) 1887
- Fremittus, vocal, and vocal resonance,
anatomic explanation of greater
amount of, normally found at
right apex, (130) 1063—ab
- Frenkel's exercise therapy, influence
of, on rapidity of conduction in
peripheral centripetal neuron in
rabbits, (125) 84
- Franklin, Benjamin, from medical
viewpoint, (2) 247—ab
- Freezing as therapeutic measure with
liquid air and carbolic acid
snow, (18) 1459—ab
- Freund's Operation: See Chondrotomy
- Friedreich's disease, diagnosis of,
(102) 1544
- Frog eyes, action of suprarenal prep-
aration on, (111) 1551
heart, isolated, action of alkaloids
of papaveraceae on, (66) 1207—ab
- Frogs, tests of heart tonics on, (69)
1801
- Fulguration, needle, as aid in cancer
operations, (62) 1893
treatment of cancer, (62) 929, (36)
1207
- Fumigation and house isolation, 8
years of, for contagious diseases
in Williamsport, (37) 2023—ab
- Fungi, trichophyton, (69) 515
yeast, in urine, (102) 1070
- Furunculitis, endemic, (17) 666
- Furo scribendi or furo loquenda (81)
417
- Furuncle and epididymitis, electricity
in, (103) 1003—ab
- Furunculosis in children and acute
pemphigus in new born, treatment
of, by packs to induce sweating
and mercuric chlorid baths, (89)
1964—ab
- G**
- Galactocoele, scrotal, (102) 1462
- Galactose in erysipelas and scarlet
fever, injections of heterologous
streptococci killed by, (91) 592
- Galen, Claudius, (128) 1719, (114)
1958
- Gall bladder, (95) 251
and appendix, hemorrhages from
stomach and intestines of follow-
ing operations on, (46) 249
and bile ducts, surgery of, (141)
511, (46) 732
bile ducts and duodenum, cancer of,
(25) 2026
carcinoma of, gallstones as factor
in etiology, (36) 589
cystic duct, common duct, and hep-
atic ducts, gallstones in, in girl
of 17, (20) 1797
disease and gastric ulcer, (29) 73—ab
diseases, and operations for gall-
stone, (143) 1063
diseases, diagnosis and surgical
treatment, (73) 1957
foreign bodies in, and gallstone dis-
ease, *1660
operations, (30) 1206
ptosis of, (72) 509
removal of, (21) 1620—ab
septic, (102) 77
surgery, anatomy, pathology and
operative technique in, (117) 1209
syndrome, appendicitis with, (62)
1549
tuberculosis of, (61) 1061
two unusual conditions of, (3) 1625
- Gall ducts, total destruction of, two
operations for, (36) 1620
- Gallstone and other visceral pain and
distress, differentiation of from oft-
recurring gastric pain, (20) 1059
—ab
- cases, three puzzling, (113) 1897
lesions, inflammatory, importance
of cholesterol concretions in,
(34) 2121—ab
operations and operative treatment
of malignant and benign gastric
lesions, (122) 1965
- Gallstones, (24) 165, (115) 925, (2)
1890—ab, *1828
and diseases of gall bladder, surgery
of, (143) 1063
and foreign bodies in gall bladder
to, *1660
and surgical aspect of inflammation
of biliary tract, (119) 995—ab
complicated with necrotic pancreati-
tis, (130) 1209
early diagnosis of, (112) 665
in bladder, (143) 601
in etiology of carcinoma of gall
bladder, (36) 589
in gall bladder, cystic duct, com-
mon duct, and hepatic ducts in
girl of 17, (20) 1797
lesions of pancreas with, (93) 1630 ab
medical management of, (66) 509,
(186) 998
motility of stomach valuable factor
in, diagnosis of, (170) 997—ab
operative indications in, (54) 335
pancreatic diabetes and (29) 508—ab
removed simultaneously with opera-
tions on cervix uteri and uterine
adnexa, (58) 1461
surgical treatment of, (154) 1145
- Galvanocautery as factor in periton-
illar abscess, (77) 1622
- Galvanometer, Einthoven's string,
electrocardiogram of man and
dog as shown by, (5) 2025
- Galvanometer, wire filament, and elec-
trocardiography, (49) 1893
- Ganglia, lobar, circulation of, (16)
1735—ab
- Ganglion Gasserian: See Gasserian
Ganglion
Meckel's, excision of, for intra-
orbital neuralgia, (35) 1627
- Gangrene, arteriovenous anastomosis
for, (61) 230
carbolic acid, (148) 996—ab
carbolic acid, of finger, (41) 993 ab
comparative hyperemia test in
operating for, (28) 2121—ab
gaseous, (65) 598
of appendix, (44) 249
of breast in diabetic patient, (32)
1147
of lung and its removal, (70) 417
of lung, nitrogen in sputum with,
(162) 427
of vulva, vagina and cervix follow-
ing abortion at sixth month, (74)
1888—ab
pulmonary, and abscess, (87) 995
resection of large lengths of small
intestine for, (31) 1212
symmetrical, (118) 84—ab, (94) 1793
traumatic, (69) 1361
- Garden hose, enema from, causing
perforation of sigmoid, *1665
- Gas and air in bone tissue, phenomena
due to, (107) 518
illuminating, poisoning from, (41)
733—ab
in stomach causation and treatment
of, (31) 2026—ab
- Gasoline fumes, asphyxiation from,
*1494
- Gasserian ganglion, endothelioma of,
(99) 83, (174) 428
physiologic extirpation of, (76) 1550
—ab
removal of, (54) 1542
tumor of, (32) 165
- Gasserectomy, dangers to cornea from,
(95) 337—ab
- Gastrectomy, partial, rupture of stom-
ach, recovery, (38) 667
- Gastric accretion, case with gastro-
tomy, (45) 590
and duodenal dilatation, acute,
treated by gastrojejunostomy, with
recovery, (15) 328, (80) 1143—ab
and other acidities, apparatus for de-
termining, quantitatively, *1105
cancer, (118) 1552—ab
cancer and pernicious anemia, (37)
1798—ab
cancer, complement fixation in, (53)
1799—ab
cancer, early diagnosis of, (14) 165,
(15) 1365
cancer, early diagnosis and surgical
treatment of, (14) 1365
cancer, early diagnosis of, from
cytologic examination of rinsing
water, (76) 1726—ab
cancer, early diagnosis and treat-
ment of, (14, 15) 1363, (2, 3)
1463—ab
cancer, operative and ultimate re-
sults in, (65) 423—ab
carcinoma, biologic research on,
(126) 1633—ab
carcinoma, inoperable, diagnosis and
treatment, (77) 670—ab
carcinoma in boy, (22) 513
carcinoma, operative treatment of,
(96) 930
carcinoma, x-ray in diagnosis of,
*853, (92) 1958
contents, delicate test for bile in,
*1758
contents in cancer, hydrochloric
acid in, (13) 1211
digestive disturbances, action of salt
in, (44) 804—ab
dilatation, diagnosis of, (135) 1145
diseases in children, (37) 2027—ab
disorders, modern methods in in-
vestigation of, (47) 667
disturbances and diarrhea of chil-
dren, prophylaxis and treatment
of, (48) 1142—ab
erosions, pathologic anatomy and
clinical picture of, (62) 1628—ab
gallstone and other visceral pain
and distress, differentiation of,
(20) 1059—ab
hypersecretion and hyperacidity,
clinical import of, (73) 1725
hypersecretion, importance of, from
surgical standpoint, (121) 1218 ab
juice and urine, chemical examina-
tion of by general practitioner,
(138) 77
juice, increased secretion and acidi-
ty of, during menstruation, (100)
424
juice, secretion of, and non-gastric
malignant disease, (13) 1049 ab
juice, secretion of, and saliva in
child with artificial esophagus,
(62) 80
juice, secretion of, in infants, (63)
80

- Gastric lesions malignant and benign, surgical, (122) 193
lesions, surgical, x-ray examinations of, (3) 1890—ab
mucous pathology of secretion of, (3) 2025
neurones, (75) 331—ab, (42) 977—ab
secretion influence on of salt solutions introduced into intestines, (3) 2121
surgery, (3) 1212
symptoms due to arteriosclerosis, 1825
symptoms, misleading, discussion of which which are liable to produce, (24) 75
Gastric ulcer, (42) 74 ab, (76) 79, (71) 1, (110) 1794 ab
and duodenal, (20) 1141—ab, (15) 1276
and duodenal, acute perforating, (119) 179, (70) 31, (97) 310, (9) 74, (92) 82, (55) 1061
and duodenal, chronic, diagnosis and treatment of, (5) 1211—ab
and duodenal, gastroenterostomy for, immediate and ultimate results of, (11) 2120—ab
and duodenal, perforated, diagnostic points in, (5) 72
and duodenal, perforated, treated successfully without suture of perforation, (15) 2120
and gall bladder trouble, (29) 73 ab
developing in hour glass stomach, (50) 1465—ab
diagnosis of, as tested by operation, (50) 1791—ab
epigastric hernia with, (73) 1895—ab
etiology and pathogenesis of, (33) 2023—ab
in infant of six months, probably syphilitic, (109) 1462
Lenhart treatment of, (25) 78
medical treatment of, (31) 2023—ab
multiple peptic, followed by perforation, (42) 590
or its sequelae, gastroenterostomy for, (24) 559
pathogenesis of, (51) 335
perforated, operation for, (21) 733
perforating into pancreas, (63) 205—ab
removal of middle segment of stomach on account of, (78) 670—ab
surgery of, (120) 425—ab, (22) 1212, (147) 1294, (14) 1263, (4) 1463, (35) 2023—ab
treatment of, (4) 1117
treatment of by immediate feeding, (1) 1463—ab
x-ray diagnosis of, (92) 1908
Gastritis, acute interstitial, (70) 1369
phlegmonous, (55) 254
Gastritis, septic, of buccal origin, (51) 1893
Gastroenteric neuroses, common forms of, (18) 800
Gastroenteritis, cerebrospinal meningitis and bronchopneumonia, differential diagnosis between, in early stages, (85) 1208
in children, (27) 233
infantile, rectal injections of sea water in, (32) 738
Gastroenterostomy and suture in treatment of perforated duodenal ulcer, (14) 2120
for gastric ulcer and duodenal, immediate and ultimate results of, (11) 2120—ab
for gastric ulcer or its sequelae, (91) 589
for pancreatic diabetes with dilatation of stomach, (6) 594
sufficiency and insufficiency of anastomosis after, (63) 335—ab
two recent cases of, (159) 1210
Gastrointestinal autoinfection, as it differs, or only symptom? (14) 1289—ab
autoinfection, urine in (52) 254
condition of dogs, effect of bone ash in diet on (29) 2023—ab
crises in tubes, (66) 1549—ab
diseases drinking of mineral waters in, indications for, (48) 992
disturbances, acute, treatment of, in infants, (118) 937—ab
disturbances due to arteriosclerosis, 955
infections, influence of environment on in infants, (52) 925
troubles in children, (116) 1062
Gastrointestinal tract bismuth and x-ray, examination of, (91) 83 ab
cancer of, (20) 312—ab
diagnosis of diseases of, (151) 594
diameter of, (49) 1000—ab
functional condition of, examination of feces for study of, (9) 1459—ab
functions of, influence of emotional states on, (28) 1400—ab
Gastrointestinal tract, immunization against tuberculosis by, (70) 122
importance of, in treatment of pulmonary tuberculosis, (128) 1623
div residue and behavior of blood on, ingestion of water by, (105) 153
upper, ulcers of, method of recognizing, and localizing, (9) 1251—ab, (41) 1791—ab
x-ray examination of thorium oxide as adjunct and partial substitute for bismuth in, (51) 536
Gastrojejunostomy, acute gastric and duodenal dilatation treated by, (1) 77, (50) 1147—ab
anatomic anatomy of, importance in, (1) 1200
followed by jejunal ulcer, (19) 2025
in acute gastric and duodenal dilatation, with recovery, (15) 125
in congenital hypertrophic stenosis of pylorus (119) 167
modification of, (77) 897—ab
Gastropylorus, false or psychic, (157) 1730—ab
Gastropylorus, (508) 1720
in tuberculous patients, (58) 108—ab
Gastroscurculitis, intermittent, (71) 1725—ab
Gastrotomy for foreign body, (75) 254
gastric secretion with, (45) 590
Gauze, wire strengthened, for plaster casts, (74) 1167

apparatus for application of, in gynecology, (27) 171—ab
application of, by general practitioner, (23) 589
artificial, in pulmonary tuberculosis, (140) 926
constriction, influence of, on local tuberculin reaction, (146) 426—ab
dangers of, (64) 2029—ab
described in writings of Hippocrates, (125) 339—ab
in gynecology and obstetrics, *263
in surgical diseases, (81) 802
in wounds and acute infections, (80) 994
induced, formation of agglutinins and hemolysins under, action of, (118) 1217
mode of action of, (54) 1466
obstructive, with elastic bandage in acute infections of extremities, (107) 332
of liver during menstruation, (142) 1219—ab
passive, in rheumatoid arthritis, tubercle sepsis and various other conditions, (35) 79, (23) 333
results of, (66) 1069—ab
suction, breast abscesses treated by, (6) 1789—ab
suction, continuous, application of, in surgery, (8) 1796—ab
suction in diagnosis of suppuration in nasal accessory sinuses, (82) 805
suction, in gynecology, instrument for, (724) 1004
technic of, application of, (120) 77
test, comparative, in operating for gangrene, (28) 2121—ab
- Hyperglycemia produced by asphyxia, cause of, (61) 924—ab
- Hyperidrosis and oily seborrhea, vary cure of, (66) 806—ab
- Hyperkeratosis linguae, (92) 924
- Hypernephroma, (38) 248
and carcinoma, simultaneous occurrence of, (3) 506
clinical study of, with pathologic reports, (21) 662—ab
diagnosis of, (102) 1804—ab
left nephrectomy for, (174) 997
of kidney, (90) 664, (19) 1620
- Hypertrophy of decidua, placental polyp with, (53) 1213
- Hypersecretion and hyperacidity, gastric, clinical import of, (73) 1725
continuous, and disturbances in pancreatic secretory functioning, (83) 255
gastric, importance of, from surgical standpoint, (121) 1218—ab
- Hypersusceptibility to tuberculin in tuberculosis, (59) 994—ab
- Hypertension, arterial, and retinal hemorrhages, (132) 1719—ab
- Hypothyroidism and Basedow's disease, (24) 328
operative treatment of, (34) 1206
- Hypertichosis, virus in, (26) 1297
- Hypertrophy, congenital unilateral, (32) 801
- Hypnotics, recent, comparison of, and drug treatment of nervous insomnia, (107) 1293
- Hypnotism, for nervous pains, (70) 516—ab
medical uses of, (107) 1793—ab
- Hypochlorhydria, tropical, (32) 335
- Hypochlorites in inoperable cancer, (17) 737—ab
- Hypochondria, neurasthenia, hysteria, and simulation, distinction between, (99) 77—ab
- Hypomodermia, immediate curative effect in, of chloroform injected in situ, (136) 170
- Hypophysis and ovaries, (81) 1726—ab
psychic disturbances in, diseases of, (57) 1548—ab
technic for access to, (59) 1299
tumor, (95) 1896

Hypophysis, hereditary, in man, due to degeneration, *32
Hypospadias and epispadias, treatment of severe forms of, (40) 227—ab
Hysterectomies and amnion, for uterine fibroids, (64) 91
Hysterectomy, (1) 1290
abdominal, for myoma, (122) 83, (8) 45—ab
and distribution, influence of, on health of woman later, (106) 100—ab
blebs, and preliminary ligation, 83—ab
by Wertheim's technique, (10) 1148—ab, (14) 178—ab
evolution of, (18) 53
supravaginal, followed by thrombo-phlebitis peroneal neuritis and paralysis, (4) 2023
vaginal, for carcinoma of cervix uteri, (170) 1211—ab, (81) 1242—ab
vaginal, for uterine fibrosis, (48) 1207—ab
Hysteria, (170) 242, (77) 994
and allied neuroses, (117) 797
and neurasthenia following accidents, (21) 90—ab
as curetonic cases, (76) 75—ab
blindness due to, *1747, *178
clinician's concept of, (7) 1205—ab
diagnosis of, (73) 1061
meningo-encephalo-myelitis suggest-ing, (71) 174
neurasthenia, hypochondria and simulation, distinction between, (91) 77—ab
ocular manifestations of, (112) 510, (142) 1294—ab
paroxysmal edema due to, (23) 804—ab
present status of, (10) 375—ab, (157) 1025—ab
psychology and psychogenesis of, and rôle of sympathetic nervous system in, (9) 927—ab
psychopathology of, (137) 511—ab
resembling sleep, (116) 328
traditional, dismemberment of, (43) 514—ab, (93) 1293—ab
Hysterosalpingostomy, (5) 2119

I

Iberia and Lusitania, tour of, (24) 1715
Iberville sonore, chemical composition and toxicity of, (52) 330
Ice bag in typhoid, (71) 1716—ab
germs in, and meat poisoning, (84) 1064—ab
test, (35) 1798—ab
Ichthyolated emulsion compound, tuberculous patients treated with, (94) 168
Ichthyosis and thyroid anomalies, (60) 1060—ab
congenital, (107) 169
Icterus hemolytic local, (82) 1363—ab
hemolytic, pathologic anatomy of, (29) 513
Identification, central vein in fore head as means of, (148) 1730—ab
Idioer, amaurotic family, (138) 1515, (12) 1891
amaurotic family, histologic examination of eyes removed immediately after death in, (157) 1295
in children, (98) 1003
prolonged and tedious labors and forceps deliveries compared as causes of, (85) 923—ab
Ignorance or malpractice? *1175
Ileosigmoidostomy for inveterate constipation, (16) 395
Ileum, lower portion of, and cecum, resection of, *211
Ileus (76) 1957
and anomalous formation of mesentery, (113) 1071
arterioesenteric, with acute dilatation of stomach, (36) 1368
bacteriemia in and postoperative paralysis of intestine, (76) 929
caused by unique enterolith, (66) 1061
death in, (100) 599
mechanism of death in, (61) 1549
Meckel's diverticulum and other binds as cause of, (28) 2022
paralytic, *1239
neuropathic, with stercoraceous vomiting, (26) 2121—ab
postoperative, *1821
postoperative septic paralytic, phlogostigmin in, (121) 379—ab
Iliacal articulation, tuberculosis of, (77) 1002—ab
Ilium puerperal neuritis and paralytic dislocation of, (98) 1301
Illinois, medical legislation urgently needed in, (138) 511

Illness, accidental, from mouse typhus bacillus, (82) 1170
Illuminant, artificial, in laryngoscopy, (110) 102
Illumination, artificial, of nasal vesicles, (108) 75
Immature, use of tobacco by, (51) 801
Immigrants, origin and condition of peoples who make up bulk of, at present time and probable effect of their absorption on population, (79) 70—ab
Immigration, Italian, and insanity, (12) 107—ab
Immune body, isolation of, from normal serum, (114) 518
substances, difference in content of, in blood serum and plasma, (10) 14
substances, production of, (11) 534
Immunity, (144) 694, (17) 114
acquired to disease, and oral bacteria, (21) 177
active produced by so-called balanced or neutral mixtures of diphtheria toxin and antitoxin, (82) 1144—ab
against tuberculosis in general parasites, *30
and anaphylaxis, (11) 1289
and infection catalytic theory of, (4) 111—ab
diagnosis and treatment, (21) 925
in tuberculosis, (77) 1513
phagocytic, and therapeutic infection of dead bacteria in endocarditis, (82) 1208—ab
problem of, in tuberculosis, (44) 73—ab
processes from surgical point of view, (77) 1294
production by inoculation of increasing numbers of bacteria, beginning with one living organism, (146) 730—ab
recent researches on, especially in relation to diagnosis and treatment, (33) 1797
to syphilis and syphilitic infection of testicles in monkeys, (90) 1726
transmissible cancer of rat considered from standpoint of, (83) 1060—ab
tuberculin, test of, on new principle, (111) 424—ab
Immunization against hydrophobia with normal brain substance, (35) 202
against tuberculosis, (74) 807—ab, (26) 1626—ab
against tuberculosis by digestive route, (69) 422
antibacterial or antitoxic, in tuberculin treatment, *261
of animals, pupin in (36) 2026
streptococcus, (90) 592
Immunizer, rôle of, in modern medicine (85) 163

- autointoxication, (89) 251—ab
- autointoxication as causative factor in pernicious anemia, (152) 1720
- Intestinal autointoxication, diagnosis of, (99) 1718—ab content, two anaerobes of, biochemical study of, (46) 1068 disease, the fly etiologic factor in, (16) 1359 diseases due to metazoan parasites, (35) 922 emulsin in higher animals, (57) 1723 flora, (27) 738—ab fluid, production of, influence of addition of adrenalin to solutions of sodium chlorid and calcium chlorid on, (30) 1956—ab fluid, ascites and urine, influence of myocardial lesions on, production of, in animals infused with solutions of sodium chlorid and calcium chlorid, (31) 1956—ab indigestion, (15) 667—ab infections, obscure cases of, (45) 740 lesions caused by trichinella spiralis in rats, (33) 800 lesions of typhoid, surgical importance of, (41) 1080 localization, *1079 obstruction, (18) 165, (30) 589, (79) 1292, (127) 1719, (99) 1859—ab obstruction, acute, (57) 733, (118) 1204 obstruction acute, diagnosis and medical management, (59) 733 obstruction, acute, etiology, diagnosis and treatment, (93) 1623—ab, (133) 1624—ab obstruction, acute, recognition of, and immediate operation, (38) 733 ab, (117) 1145 obstruction as complication of acute appendicitis, (95) 1623, (135) 1624—ab obstruction by ball of vegetable fibers, (93) 805—ab obstruction by round worms, (38) 1620 obstruction due to volvulus or adhesions of sigmoid, (33) 993 obstruction during pregnancy and puerperium, (142) 1145 obstruction, enterostomy in, (9) 165, (28) 1620 obstruction from traumatism, (52) 167—ab obstruction in new-born; strangulation through hole in mesentery, (37) 928 obstruction, intermittent, from kinks in large bowel, (94) 1623, (132) 1624—ab obstruction, mechanical dynamic, *619 obstruction, operative treatment of, (126) 673, (178) 1795 obstruction, outline for treatment based on cause of death, (46) 1790 obstruction, prevention of, following operation for appendicitis, (35) 993 obstruction produced by enormously distended stomach, (8) 1211 obstruction, tuberculous, (116) 925, (96) 1623—ab, (134) 1624—ab paralysis, (82) 802 perforation in typhoid, (32) 1886 perforation in typhoid, diagnosis of, *695 putrefaction, and indicanuria, (160) 926—ab sand: the banana one of its sources, (64) 1143—ab therapy, lactic acid ferment preparations for, (13) 1296 tract, importance of, in origin of anthracosis of lungs and abdomen, (134) 1729 wall, sarcoma of, intussusception containing, (5) 1463
- Intestine, acute perforations of, laparotomy for, (26) 928
- Anastomosis of: See Intestinal Anastomosis
- and appendix, carcinoma of, in young, *1471
- and bladder, fistula between, treatment of, by exclusion of former, (102) 599
- and esophagus, congenital atresia of, etiology of, (68) 423
- and stomach, double clamp for operations on, (78) 807
- auto-amputation of, total, (92) 929
- auto-elimination of nitrogen and mineral salts into, in health and disease, (67) 1801
- chronic catarrh of, (19) 27, 72
- discharge through, gangrenous appendicitis with spontaneous cure due to, (45) 417
- double large, in new-born infant, (33) 1297
- exclusion of bile from, and putrefaction in intestines, (111) 672
- fevers originating in, in children, (70) 75—ab

- Intestine, hemorrhage from and perforation of, chronic nephritis terminating with (17) 1722
lysis of, (72) 74—ab
implantation of ureters into, for atrophy, (26) 612
importance of, in origin of anthracosis of lungs and abdomen, (111) 1721
introduction of tubes, bougies and metal instruments into, (97) 1291—ab
Iris, (C1) 1814—ab
large, injured diverticuli in, (C1) 741—ab
large, chronic dilatation of, in old eye, (34) 1512
Iris, imperfect development of, and of lower part of small intestine, (75) 1888
large, removal of tumors of, (11) 1794—ab
paralysis of, postoperative and biliary in ileus (36) 929
perforations of, after treatment of, with saline solution (23) 1715
perforations of, multiple, from gunshot wounds, (9) 33—ab
resection of, (41) 1206—ab, (77) 1211—ab
resection of seventy inches of, after perforation of uterus, *1063
resection of, with end to end anastomosis by Parker-Herr method, recovery, *1107
salt solutions introduced into, influence of, on gastric secretion, (76) 2121
secretion of mucus in, (111) 518—ab
small, absorption of fat from isolated loop of, in healthy dogs, (71) 75—ab
small, and its mesentery, surgery and surgical anatomy of, *1073
small and large, experiments with exclusion of, (120) 1217
small cecum and ascending colon, volvulus of, operation and recovery, (3) 1115
small, construction of vagina out of loop of, (179) 922
small eversion of, and injury to abdominal wall in infant, recovery (60) 1461—ab
small, lower part of, and large intestine, imperfect development of, (78) 1883
small, resection of large lengths of, for gangrene, (31) 1212
small, ruptured (9) 253, (34) 254
small transplantation of, (73) 423
so called retrograde incarceration of, (107) 99
subcutaneous prolapse of, (95) 929
temporary closure of colon during operations on, (124) 425
total transverse section of, and confusion of abdomen with rupture of wall, (119) 1071
Intestines, absorbing capacity of, during forced feeding and muscular exertion, (130) 426
and stomach, hemorrhages from, following operations on gall bladder and appendix, (46) 249
and stomach, investigation of, by bismuth method, (91) 83—ab
and stomach, syphilis of, (41) 1790
asepsis in operations on, (35) 172—ab
injuries of, in gynecologic operations, (123) 1218
perforation of, surgical treatment of, in typhoid, (38) 1791—ab
putrefaction in, and exclusion of bile from, (111) 672
subcutaneous rupture of, pathogenesis of, (65) 1363
Intoxication, Acid See Acid Intoxication and Acidosis
acute and chronic, from alcohol and other drugs, mental responsibility in, (116) 1953
alimentary, in infants, camphor in, (94) 743—ab
anaphylactic, localized, in children after repeated injections of anti-toxin, (103) 1938—ab
chloroform internal, treatment of, (112) 672—ab
fatal, suggesting cholera, from gases generated by ferrosulfium in ship's cargo, (89) 1003
food, action of deprivation of food in, (124) 1072—ab
food, in infancy, *687
in nutritional disturbances, (131) 426—ab
transient, from bismuth paste treatment of fistulas (79) 1070
zinc, from intrauterine cauterization with zinc chloride, (82) 743—ab
Intrasigmoid disease, (170) 1720—ab
Intravenous anesthesia, (12) 1166—ab
injection of biclorid of mercury in acute inflammatory rheumatism, (91) 1151—ab
treatment, present position of, (14) 1117, (21) 1212
Intubation and laryngeal diphtheria, (18) 1791
and trichotomy, in diphtheria, (69) 1291
peril in cleft palate operations, (73) 2070
successful, in laryngeal stenosis in adult, continuous wearing of tube for four years, (57) 1401
Intussusception (20) 925
acute, early diagnosis and treatment, (18) 25—ab
and Henrich's purpura, (12) 995
complicating typhoid, (57) 643
containing sarcoma of intestinal wall, enterectomy recovery (140) 1403
diagnosis and treatment (127) 1115
of sigmoid colon, (7) 1025

mineral, of Saratoga, (91) 1776
sulphur mineral, for children, (103) 177-ab
tidal, discharge of sewage into,
*1231
Wave form, relation of, to functional
activity, (67) 1112
Weather, change of, occurrence of
pains on, (84) 1802
Weight and height in determination
of condition of nourishment, (117) 1552
and metabolism of chlorides in scar-
let fever, (114) 1622
during pregnancy, (62) 1001
of rabbits, relation of weight of
contents of stomach and cecum to,
(12) 509
Weights, standard, table of, for
women, (15) 218
Wepfer, John James, a renaissance
student of apoplexy, (75) 691
What brain, ash constituents of, in
metabolism of herbivora, (41) 1161-ab
Whey, production of, by colloidal
precipitation of milk, (61) 1623
White rice, conquest of tropics for,
*1967
Winfield, Bryn Watkins, (148) 1515
Whooping cough and chickenpox with
scarlet fever, (167) 927
antitoxin in, (29) 1209
Bordet Gengou bacillus, (17) 509-ab
contagion in, treatment and danger
of, (127) 931
etiology of, (89) 82
from point of view of public health,
*2094
measles and scarlet fever, antitoxin
or serotherapy in, (15) 1206
present knowledge of, (120) 169
quinn in, *1832
treatment of, (105) 333-ab, (81) 671-ab
Wire filament galvanometer and elec-
trocardiography, (49) 1593
Witches, trial of, at Stockholm, in
1676, psychologic expert testi-
mony in, (139) 1633-ab
Woodill, J., surgeon general, (33) 923
Woolsorters, miners and others, dis-
eases of, (22) 171
Worm, lumbricoid, in ovarian abscess,
(161) 1795
Worms, round intestinal obstruction
due to, (38) 1620
Wound, abdominal, penetrating, with
out symptoms, (89) 1888
Wound closure with minimum scar,
*1333
gunshot, abdominal, complicated,
(70) 1149
gunshot, abdominal, involving stom-
ach and jejunum, complicated
with pregnancy, (34) 250
gunshot, of lower jaw, prosthesis
for, (64) 423
gunshot, rare complication of, (12) 1953
in foot, scarlet fever from, (168) 997-ab
of hand and forearm, from ramrod
shot lengthwise through, (81) 1530
perforating, cystic formation by
pars ciliaris retinae following, in
ciliary region with histologic
findings, (158) 1295
Wounded, Mexican wheeled stretcher
for transport of, on battlefield,
(80) 1208
Wounds, abdominal, penetrating, (6) 1058, (128) 1545
and acute infections, hyperemia in,
(80) 994
and dressings, instrument for apply-
ing ointment to, *1573
gunshot, (12) 666
gunshot, abdominal, (23) 1620, (41) 1799
gunshot, abdominal, multiple per-
forations of intestine from, (56) 335-ab
gunshot, abdominal, treatment of,
advocated by French military sur-
geons, (146) 1720
gunshot, brain abscesses after (80) 929
gunshot, infection of, (83) 929
gunshot, of chest, (157) 1361
gunshot, of stomach, with retained
bullet, (77) 1549
gunshot, suture of lung in, (78) 1726
ab
of abdomen and fracture of skull,
in emergency operations, (161) 1599

- Wounds of civil life, importance of first-aid dressings in, (139) 665
 of heart, diagnosis of, and value of water-wheel sound in stab wounds of chest, (47) 1627
 of heart, suture of, *429
 protection of, against infectious germs from adjoining skin, (51) 1799—ab
 shrapnel, (17) 1067
 suppurating and granulating, and leg ulcers, blue electric arc light in treatment of, (67) 1894—ab
 stab, of lungs, medicolegal aspects of, (53) 173
 stab, of lung, suture of, (79) 1214
 sutured stab, of right ventricle, (116) 83
 treatment of, (3) 253—ab
 treatment of, with plaster-of-Paris, (116) 424
 Woman, generative processes in, and cholelithiasis, (129) 1072
 how long should she remain in bed after normal labor? (70) 734—ab, (107) 1003
 influence of castration and hysterectomy on health of, later, (105) 1003—ab
 justifiability of sterilizing after Cesarean section, (50) 2024
 Woman, parturient, status epilepticus in, (30) 334
 pregnant, care of, (53) 733—ab
 pregnant, young, infected sinus thrombosis in, mastoiditis followed by, (7) 1619
 tobacco amblyopia in, from cigars, (68) 1292—ab
 Women and girls, bilharziosis of, in Egypt in light of skin-infection theory, (9) 1305—ab
 backache in, causes and treatment of, *11
 cystitis in, (103) 510
 diseases of pelvic organs of, electricity in, (167) 1210
 epispadias in, treatment, (120) 518
 genitalia of, repair rather than removal of, (37) 329—ab
 gonorrhea in, (22) 1459
 gonorrhea in, complications of, (142) 926
 gonorrhea in, pathology and treatment of, (177) 1795
 gonorrheal urethritis in, (13) 1140
 Jewish and Russian, date of first and last menses in, (108) 1371
 latent syphilis in, and transmission of syphilis to child, (144) 1730
 nervous disorders in, simulating pelvic diseases, *848
 neurasthenia in, (19) 421
 Women, neuroses and psychoses of, (19) 1206
 peritonitis, tuberculous, in diagnosis of, (26) 2022
 pregnant, and new-born infants, serodiagnosis of syphilis in, (39) 1798
 sterility in, etiology and treatment, (42) 1298—ab
 tabes dorsalis in, during child-bearing period, (122) 1218—ab
 table of standard weights for, (13) 248
 unusual malformations, of pelvic organs in, (42) 334
 Work cure in mental and nervous diseases, (75) 2030
 Wrist, dislocation of, anterior, (74) 1549
 dislocation of, congenital, (34) 999—ab
 dislocation of semilunar bone of, (100) 1152—ab
 Madelung's deformity of, (82) 423
 tuberculosis of, (44) 334
 Writer's cramp, recurring, (24) 1464—ab
 X
 Xanthoma diabeticorum and lipoma multiplex and xanthoma approaching diabetic type with diabetes insipidus, (131) 420
 multiplex, (121) 1363—ab
 Xanthomatosis with chronic jaundice, (59) 741—ab
 Xeroderma, (30) 922
 X-Ray: See Roentgen Ray
 Y
 Yaws, protozoon in, (45) 80
 Yeast, food extracts made from, (3) 170
 fungi in urine, (102) 1070
 nucleic acid, reducing component of, (184) 1064
 Yellow-fever and other major infectious diseases in Cuba, notification and morbidity returns, (61) 195
 diazo reaction in, (54) 2028
 in Mexico, (45) 1957
 in tropics, *1075
 intracellular parasite alleged cause of, (58) 1893
 Yoghurt bacillus, inhibiting action of, on colon bacillus, (163) 427
 Z
 Zenker's Degeneration: See Muscles, Waxy Degeneration of
 Zinc-chlorid, intrauterine cauterization with, zinc intoxication from, (82) 743—ab

CURRENT MEDICAL LITERATURE

INDEX OF AUTHORS

In this Index are the names of the authors of articles which have appeared in THE JOURNAL of the American Medical Association and of articles which have been listed from week to week in the Department of Current Medical Literature as having appeared in other journals. Thus it practically includes the names of all who have published articles in the leading journals of the world during the past six months. To add to its completeness, the names have been added of those who read papers before societies as published in THE JOURNAL. The * preceding the page reference indicates that the article appeared in full in THE JOURNAL. The numbers in parentheses indicate the numbered paragraphs on the pages referred to. The numbers not in parentheses indicate pages.
